FOREWORD

International Balkan and Near Eastern Congress Series brings together many distinguished social and behavioral science researchers from all over the world. Participants find opportunities for presenting new research, exchanging information, and discussing current issues.

We are delighted and honored to host the IBANESS Congress Series in Plovdiv / Bulgaria. Presented papers have been selected from submitted papers by the referees. Sincere thanks to those all who have submitted papers.

We hope that through exchange of the presented researches and experiences, the Congress will enhance communication and dissemination of knowledge in Balkan and Near Eastern Countries.

Civil Society and The State

Dr. Abla Xhaferi¹

¹European University of Tirana, Albania

Abstract: The object of the article is civil society and the state, the relationship that exists between them. Its purpose is to show the concept of civil society, the relationship of the state with this society, with the intellectual elite and the laws that govern it. There is no unified position on the concept of civil society. Philosophers of antiquity by this term meant the unit that includes the state and political society. Philosophers of later periods saw it as the product of a social contract or as the relationship of individuals with different personal interests, as the basis of a society that establishes spaces of freedom between citizens and government. By the marxist philosophy it conceived as a mechanism of competition between individuals acting to pursue their private interests. With the new concept of the term, it was considered as a natural and necessary result of the economic organization and the organization of associations and other non-state and non-profit unions built on a voluntary basis. Civil society relationship with the state were evaluated based on respect for human rights by the state institutions, implementing the law. Civil society was assessed as the basic cell for building of the legal state, where laws are voluntarily obeyed. The relationships of the state with the intellectual elite is often contradictory, because the elites, after taking power, seek the longevity of a good state, seeing very often only the narrow interests of the individual and the clan that rely on it. The state and its leadership need reform elites, who will draft and implement only laws that serve the whole of society.

Keywords: civil society, state, power, intellectual elite, law, relation, organism

There is a conceptual division between the state and society. Many philosophers think that society is the totality of individuals and their groups who have personal interests, which they seek to fulfill at all costs. The state is the organism that acts impartially to meet the interests of its citizens, representing the general interest.

1. The concept of civil society

This concept has been understood in various ways and there is still no one-size-fits-all definition. Her origin is in the Aristotelian notion of political community and in many Latin terms (*societas civilis*, *communitas civilis*, *communicatio*, *communio et coetus*, etc.)¹

By this term the ancient Greek philosophers meant an entity that included both the state and political society itself. Civil society referred to the collective interactions of the person with the state, as a citizen of the polis. This understanding of civil society continued to accompany him in later centuries.

The concept of civil society is closely linked to political culture. Hobbes (1588 - 1679) used the term "civil society" to denote the degree of civilization of society. He saw this society as the product of a social contract by which people voluntarily abandon their state of war,² giving their freedom to the state in exchange for their peace and security. The union achieved in this way, he considers the body of a state, a society, as well as a the civil person.³ John Locke (1632 - 1704) by the term "civil society" meant "A political or civil society that exists only when a number of people unite, relinquishing all executive rights of natural law and assigning it to the public."⁴

4 Stuph, E. S. *Filozofia: Historia dhe probleme*, Shtëpia botuese "Toena", Tiranë, 1998, p. 129

The German philosopher Friedrich Hegel (1770 - 1831) also paid special attention to civil society, conceiving it as a relationship between individuals with different personal interests. The family (universal) opposes the special (individual). The family in this analysis serves to show the embodiment of the universal, while civil society represents the individual who sets his goals, independently of other family members. Hegel considers civil society to be the highest form of life, since, by realizing the connection of the family with the state, it aims at the connection and interaction of the individual with the state. The interest of the individual enters into relationships with others by cooperating with them. The individual becomes aware of being in society, as a result of education through civil society institutions. The history of civil society is the history of the education of individuals and social groups, which are put at the service of society itself.

According to Hegel, civil society in its activity includes the system of production related to the market, as well as classes, various social and religious institutions. Civil society is the arena where modern man legitimately fulfills his interests and develops individuality. However, in society he learns the value of acting and behaving in a group, social solidarity and the dependence of his well-being on others, who educate him about citizenship and prepare him for participation in the public sphere.

An important contribution to defining the values of civil society are the thoughts of Alexis De Tocqueville (1805 - 1859). He was impressed by the reality of free and equal society he knew in America and was encouraged to write about civil society as an important and essential element of Western civilization and the basis of a society that establishes spaces of freedom between government and citizens. In the universal freedom of American citizens, he found the idea of a civil society embodied. He was particularly attracted to the various forms of civic organization in order to achieve many works for the benefit of the community, which he would regard as the implementation in reality of a "living democracy."⁵

The observations he made served him who could go even deeper to the role of the state and society. Through them he was also able to define some spaces of action of society. The most important space, according to him, was the one that included the state, which is political representation through parliamentary assemblies, courts, bureaucracy, army and police. For this reason, Tocqueville would call civil society the arena of private interests and economic activities. He thought that society is nothing but the art of accompanying together, and art of organization in the society and groupings.

Inspired by the model of American society, Tocqueville sought to highlight the qualities that should characterize civil society. He called for a society for citizens, represented by political organizations in a manner similar to local government bodies, political parties and public opinion. These requirements are valid even in today's society. Tokville describes civil society as a "school of democracy" that functions through associations and social organizations.

Marx (1818 - 1883) conceived of civil society as a competing mechanism between individuals who strive to pursue their own personal and private interests. He thinks that this society includes all the material relations between individuals within a period of development of the productive forces. Civil society as a social organization derives from trade and production, it forms the basis of the state and at the same time of the superstructure. According to Marx, the social structures of this society are scattered throughout the economic structure. Civil society, then, arises from the bourgeoisie, as this is the class which owns the means of production.

Marx regarded civil society as a bourgeois society, which was focused on the realization of private interests and steeped in corruption. G. Tushi underlines that "In his battle against civil society, Marx used as an additional weapon the idea that civil society is a society that alienates the common man, depriving him of property, identity and dignity."⁶

⁵ Tushi, Gëzim. *Shoqëria civile*, Shtëpia botuese "Dudaj," Tiranë, 2007, p. 10

⁶ Yes there, p. 60

So Marx regards civil society as an instrument in the hands of the bourgeoisie, which uses it to maintain its power, especially economic power. This society does not make man independent, on the contrary it alienates. He thought that building a communist society would be a paradise on earth.

Applying the teachings of Marx, during the monist system in Albania, the real role in civil society was not recognized and not accepted. In the system of the dictatorship of the proletariat, the Albanian one-party intellectual worldview inherited a mentality that responded to the interests of the party-state and its leading ideology. This is also the reason why appreciation for civil society was included in global definitions as "working masses" and for many mass organizations as "transmission belts", which conveyed party ideology or as "leverages" in the hands of the party. This mentality also accompanied the political elites who led the democratic processes in our country.

With the fall of communism in Eastern Europe and the Soviet Union, the concept of civil society attracted the attention of young scholars to explain the growth of democracy or its absence. Communist regimes had tried to override civil society and control almost everything.

When a totalitarian regime collapses, it leaves a vacuum, where a civil society must exist. Nothing works properly and law absence invade place. The Americans hoped that after communism Russia would soon become like them, but there was no civil society there and authoritarianism soon returned again. Even for Iraq, it was thought that after the fall of Saddam Hussein, would restore stable democracy a small civil society, but this degenerated into chaos.

A vibrant and developed civil society is the key or essence of democracy. Central Europe moved quickly towards democracy because it had a considerable amount of civil society. Without the latter, democracy cannot be established.

In the philosophers' treatment for the notion of civil society, an attempt is made to highlight the difference between the low and barbarian level of human society (including even the form of harsh governance and outside the legal requirements) and the level of a civil society led and governed by certain norms and laws accepted by all.

The term "civil society" over a long period of time has preserved in content and in form various nuances, which are closely related to the essence of society itself and the concept of the state.

Civil society would coexist with the state until its reconceptualization by the thinkers David Hume (1711 - 1776) and Adam Ferguson (1723 - 1816), for whom civil society is a historical product, a natural and necessary result of the economic organization of society. According to Ferguson, civil society, along with the state and the economic market, is the third constituent element of society.⁷

Like Ferguson, Jurgen Habermas thought that civil society constituted the third sphere, besides the state and the market, which is characterized by the public articulation of society's problems. For Habermas, the essence of civil society lies in the organization and active existence of various associations and other unions built on a voluntary, non-state and non-profit basis, which with their activity determine the structures of public communication in all components of the social life.

All democratic change in a country is closely linked to the presence, level and aspirations of civil society. As in the case when democratic changes go in the right direction, even in the case when they are realized only for the benefit of a group of people or clans with certain interests, it is spoken on behalf of the vital needs of society itself. This is because the very concepts of the theory and practice of democracy come from the people.

It is only the interests of the people that always justify the need for socio-economic, political and cultural upheavals of a society. The people are the true sovereign who must hold the spectrum of democracy in their hands. For this reason, building civil society remains a permanent ideal for building a developed democracy.

⁷ Ferguson, Adam. *Essai sur l'histoire de la société civile*, Traduction, introduction, notes et index par Patrick Vieu, ENS Éditions, 2013

In totalitarian and anti-democratic regimes the term "civil society" is used as a cosmetic ointment and mainly only in the propaganda aspect. Slogans emanating from Marxist-Leninist theses, such as: "Socialism is built by the masses, the party makes them conscious," it was taken out of the very beginning "out of the game" not only as a notion, but also as really unnecessary existence of "civil society", even as a foreign concept and instrument with bourgeois influences.

It was argued that only in the bourgeois system could civil society organizations play a progressive role, such as trade unions, opposition, cultural and political organizations, which could oppose the capitalist state in defense of their truncated freedoms. In the socialist system the political program of the working class, as the most revolutionary class of society, guaranteed it all human freedoms, with the exception of the overthrown classes, already stripped of economic and political power.

The democratic processes in Albania threw light on the painful reality of the people's life and showed how far they had lived away from the dream of a free and democratic society. The need to build democracy also highlighted the role of civil society in reference to democratic values, the harmony, balance and control of powers, their independence and the functioning of the state of law.

Political parties are actually part of different groups in society and represent their interests, but they have certain ideologies and political programs. Their aim is to seize political power, and after seizing this power, they aim to protect the political and economic victories of a certain group and not of all sections of the population, by any means and at any cost. In this sense, we encounter the "abandonment" of the interests of the broad masses of the population by these political parties, even labeled leftists in their propaganda program. These sections of the population are "doomed" to always pay the costs of the mistakes of various political parties.

In all societies and political systems produced by human society, civil society serves as a mirror in which one can see the form and content of this society itself and the political system that governs the economic and political life of the country.

When it comes to the interests of civil society itself and its engagement in the socio-political life of the country, the situation is different. The role of this society in organizing citizens in a permanent war with the oppression exercised by the state and its representatives is irreplaceable. Experience has shown that, after taking power and dividing national wealth in favor of a certain clan group, the ruling political elites violate their promises with electoral effect, declaring their mission almost complete. Protecting the interests of society and the people for them turns into an open or disguised demagoguery. This phenomenon forms the dividing line between the interests and programs of political parties and clans, on the one hand, and the interests of civil society, on the other. Civil society is the only obstacle to not endangering the political and economic rights of the individual. Politicians see democracy as a commodity from which everything should benefit, while for civil society democracy contains the highest values of freedom and citizenship.

2. The relationship of the state with civil society

Analyzing the relationship between the state and society, Rousseau affirms the supremacy of the state, but not the supremacy until the degree of enslavement of the people to his orders. As an essential condition for the functioning of the state-society relationship, Rousseau emphasizes the respect of human rights by state institutions, as well as the functioning of institutions, respecting and enforcing the law. He emphasizes that a democratic state is not worthy of a people who would abuse its government. This means that a citizen who does not contribute to the good functioning of his state, can not claim to have good governance. An individual who corrupts civil servants cannot claim that corruption disappears. An individual who violates the rights of another individual cannot claim the existence of so-called "State of right".

Since the level of civil society plays the role of a barometer related to the level of economic - cultural development of a people, at the same time it remains a basic condition of the process of integration of our country in the European Union. This demand is one of the most acute challenges of the Albanian society during this decade, because its partnership carries a mutual interdependence between the civil society and the climate of a stable democracy.

But, on the other hand, its democratic qualities and features also produce the "necessary vital climate" between the individual, the state and the market, keeping under control and mitigating negative tendencies, stimulating and promoting social development, contemporary values and traditions.

A trend of recent times identifies the issue of civil society or pluralism as the main key to separating governances from each other. Every modern society consists of associations and organizations with different character, such as: economic, commercial, productive, cultural, religious, of veterans, of the militarys on release, workers' unions, industrial corporations, civil society organizations, political parties, mass media etc. We can classify governances based on estimates and the government support for these associations. In pluralistic systems, associations are favored by independence and freedom of action, and may even influence the governance of the country itself.

Civil society is characterized by civic initiatives for self-government. It requires cohesion, civic virtue, cooperation, tolerance, solidarity, commitment and participation in public affairs to prove itself as a free and democratic society. The characteristic that keeps civil society stable and active is the fact that it is linked to the processes and destiny of pluralistic democracy.

The work program of civil society is closely linked to many cardinal problems of society itself, such as: protection of human rights, development and spread of a culture of tolerance in society, building the rule of law, the rule of law and of stable institutions, which will serve as a guarantee for building a modern democratic state. A civil society characterized by these features remains a basic condition for building a sustainable democracy.

The methods and concepts of an active civil society for resolving conflict using tolerance, consensus and compromise instruments are well known. In closed societies the lack of tolerance and civic consensus will continue to produce conflicts and backwardness in the development of democracy in that country.

The polarization among the leading political elites remains "gangrene" that has been eroding Albanian society for decades. Such a diagnosis confirms Sartor's view, when he underlines: "Until a democracy has not yet managed to establish a solid basis for consensus, it is but a difficult and fragile democracy."⁸ Albanian politics needs changes in its mentality, it must be reformed, becoming more democratic, more tolerant and more open to change.

There can be no consensual society without a set of values recognized and accepted as principles that govern its functioning. A contemporary civil society tends to resolve conflicts, agreements and compromises.

Parties and albanian political class continue to generate in its membership concepts such as: "The winner gets everything, while the loser loses everything"; "The opposition is the enemy," turning state posts and institutions in party "parcels or properties".

In his work "Social Contract" Rousseau argued the reasons for the abandonment of man from life in the free and wild natural state in the collective, ie civic. Community life is built on two main pillars, which are the rights of this individual and his duties. Community life raised the need to design a legal system, exercise the right to vote and take an interest in public affairs. But participation in social and civic activities dates back to ancient Greek civilization.

In the opinion of the eminent sociologist Ralph Dahrendorf, in ancient times "A citizen is the citizen, originally a resident of Athens in the fifth century BC."⁹ It was exactly the 5th century BC the golden age of Pericles and Athens where the concepts "city", "citizen" and "citizenship" were first born. Of course these concepts are neither static nor immutable. These concepts changed and evolved in line with the progress of society.

⁸ Sokoli, Lekë. *Demokracia dhe problemet sociale*, Shtëpia botuese "Isps&Rinia," Tiranë, 2002, p. 103

⁹ Dahrendorf, Ralf. *Konflikti shoqëror modern*, Shtëpia botuese "Dituria," Tiranë, 1997, p. 45

Civil society is built and functions with the participation and involvement of citizens in community affairs. Ralph Dahrendorf underlines: "Citizenship is a range of rights and obligations ... Citizenship is a concrete social function."¹⁰

Citizens are the essence of creating social relations and, consequently, the creators of various social organizations. Establishing balanced relations between rights and duties is one of the duties and responsibilities of civil society. But what do we mean by obligations? According to him, one of the indisputable obligations of citizenship is respect for the law. This is the first obligation of citizenship. If the violation of the law is allowed to be tolerated by society, it is no longer a citizen society, on the contrary, it is an anarchic society, which is not ruled by law but by violence and as such, it loses its role as a society because it returns in a crowd.

From this point of view, civil society is the basic cell of building the rule of law, of a state in which the citizen voluntarily respects the laws and the rule of law. A citizen is one who voluntarily submits to the implementation of law, while a society that does not respect the law is a major obstacle to building of state and civil society.

The word "citizen", the sense of citizenship and civil society are closely related to each other, because without civic sense civil society can not be built and without a consolidated civil society its development is not realized. Citizenship is not a matter of personal will, but it is a social contract, which must be implemented by all members of society. There is no civil society without citizens, without people engaged in solving their problems but also of society. Citizens are able to take on the tasks and responsibilities that belong to them. The development of civil society is not a process that happens by itself, but it requires a great dedication and commitment. Civil society is a space that creates opportunities for citizens to become active democrats, makes citizens aware of their rights and obligations in society.

Civil society also makes an important contribution to the development of democratic structures and political cultures. The existence of a civil society is inevitably linked to the engagement of citizens and their participation in public life and affairs. Civil society is the only social instrument that affects the cultivation of civic responsibility, the sense of respect of every citizen for society and his state. Experience has shown that there can be no implementation of a good democratic politics and governance without citizens and a responsible society.

The process of building a civil society is cohesive and interdependent on the level and socio-cultural environment of its citizens. Being also an important instrument in the service of strengthening freedom and democracy, we can say that, without an active and consolidated civil society, there can be no modern civilization. Civil society is the institution that organically unites civic visions and interests with the rights and responsibilities of everyone. Its existence provides the democratic system with a balanced concept of the highest responsibility for the citizen, for social groups and society itself, through the definition of rights and duties.

Even the democratic system itself cannot exist without the development of the space of thought and civic organization, which "feed it" with oxygen. Therefore, it remains a primary task for the present and the future of democracy, the functioning of strengthening civil society and the creation of a space where citizens feel themselves decision-makers. The process of European integration of our country can not be successful without the commitment of other social actors. As civic participation, the ability to self-organize, mobilize and volunteer are still at minimum levels, the very process of democracy and European integration have an insufficient pace, which does not match the goals of Albanian society. Civil society and political institutions resemble communication vessels, which enhance, nurture and empower each other.

¹⁰ Yes there, p. 48

3. The relationship of the state with the intellectual elite

The rule of law is a product of the will of the citizens. The essence of its nature is related to the protection of the rights of citizens and their freedom, therefore it is also the legal-social guarantee of the state in the complex relations between state institutions, civil society, people with outstanding intellectual merits and ordinary people.

In modern societies, the state, being in the role of "regulator", also shows restrictions (up to obstacles) to the bold and progressive ideas of citizens and their elites. His relationships with the individual, in addition to common interests, is also characterized by contradiction. These contradictions and obstacles are also noticed in the relations that a new power seeks to build with the old power and the people themselves. Machiavelli, analyzing them in the circumstances of a ruling ruler, emphasizes that "the prince, who seeks to retain power, must learn not to be always good and act good or bad according to the need that will be presented to him".¹¹ According to him, a new ruler in power is convinced that there is nothing more difficult to deal with and more dangerous to run than to become a ruler and try to introduce a new order. This is because a new ruler has opponents all those who have been privileged by the old power, but to some extent also those who seek to take advantage of the new power, who, as long as they do not see their new proposals are implemented, do not have full confidence and become not fully established supporters.¹²

Intellectual elites have progressive ideas and demand qualitative changes, seek the advancement of society and state institutions. But the latter prefer the status quo. Leaders of high state ranks in every country and at all times issue rules and laws to enjoy for the longest possible time privileges in relation to other strata of the population. Any change demanded by intellectual elites and ordinary people would jeopardize these privileges. For this reason, the leaders of state institutions are on the opposite side of the barricade, utilizing to the end the power of power, seeking to limit and control the activity of the people and the intellectual elites. When these contradictions are not resolved peacefully, fierce until fierce clashes or skirmishes can ensue. In order for this not to happen, it is necessary to elect in the state leadership people with high intellectual levels, reformist people.

Albania needs a reformist intellectual elite, which is going through a long period of transition also because the popular masses are disappointed by political parties of the entire political spectrum. The creation of a more efficient state apparatus would better reflect the demands of the time and would directly affect the advancement of the integration process in the European family. The basic criterion for the implementation of reforms would be the participation of the people in their design and implementation, as long as they are implemented for the benefit of the people. But this leaves much to be desired, because in practice the place of the people has been taken by their chosen ones, who do not in every case work for his interests.

4. The state and individual

An interesting point of view is Aristotle's worldview on the fact and circumstances of the conditioning of the universal by the individual. Such a view expresses the inseparable relationship of the state with the individual. And, just as a building is built on solid foundations, so the democracy of a society is consolidated when it guarantees the rights and freedoms of the individual. Regarding the provision of individual freedoms, much has been speculated in the former communist countries through the propaganda of the freedom of society all in all.

From time to time various observers conduct tests, which result in a "strange" fact: the people of the least developed countries are also the happiest people in the world. Thus, "these happy people" can be found in abundance in Latin America, Africa, the Far East or the backward countries of the Balkans, where the vital level per capita of the population is lower than that of the peoples living in the Nordic countries.

¹¹ Machiavelli, N. *Princi*, SHTËPIA BOTUESE ENCIKLOPEDIKE, Tiranë, 1992, p. 74

¹² Yes there, p. 83

In recent tests most European Union countries are dissatisfied with this union and their standard of living. Quite the opposite happens with the peoples of the countries of Southeast Europe, whose dream remains the European Union and the stad of their democracy. These two phenomena can be explained by the fact that the peoples of developed European countries demand higher living standards and are dissatisfied with their "status quo", while the peoples of Southeast European countries want to take advantage of the advantages provided by the political systems of a developed democracy.

Their dream remains to be accepted in the European Union, of the rule of law and of hearing the voice of the sovereign. In our country, the highest figure of the country, the President of the Republic, on whom all judicial power depends, he is elected according to the interests of a party group and the consequences are known: the judiciary is far from being a just power, where everyone is equal before the law.

Indeed, the state of the state-individual relationship is one of the most convincing and objective indicators that proves the level of democracy of a country. Consequently, the happiest, most self-realized and most prosperous people are those who live in the most developed and democratic countries.

Aristotle is one of the philosophers who points out the need and connection of the individual with the state, especially when he states: "He who is unable to live in a state, or he who does not need it because he is self-sufficient, must be or beast, or god."¹³ From this conclusion is self-evident the function of the state for the creation of material goods and human happiness to the highest degree.

The ideas put forward by Montesquieu on the obligations of citizens are quite current for the Albanian reality. Their non-implementation directly damages the democracy in the country and the proper functioning of state structures. Thus, the occupation of lands by party leaders, the exercise of the law of the strongest are gangrene problems of Albanian society for more than two decades. All these phenomena have essentially damaged democracy itself and the dream of the poor, who see no other way but to leave their homeland.

Democracy is the coexistence between philosophy and the concepts that guide human society to live free. Such a concept that reminds us of the sun, illuminates and gives life to all powers independent of each other: executive, legislature, judiciary, etc.

First of all, a political system is called democratic when a majority or a large number of people enjoy human freedoms and the right to vote. From this point of view it can be said that exactly the level of human rights and freedoms constitutes the essence of democracy of a developed society. A democratic state is based on the principle that the government is to serve the people, while the people are not to serve the government. In a democratic country, when citizens vote, they exercise their right and responsibility to decide who will lead them.

The citizens of a democratic country enjoy the right, that, at will, to participate freely in the political life of the society of which they belong. But, at the same time, the citizens must take into account the tasks arising from this participation. Thus they must be accustomed to how to deal with problems, show tolerance towards members of society who have opposing ideas, and, when it comes to common interests, compromise between them.

Citizenship in the above cases implies a broader definition of rights and duties, as two opposite sides of the same coin. The exercise of rights by an individual also implies the responsibility that he has for the protection and empowerment of these rights, for himself and for others. Citizens of countries with well-known traditions in the field of democracy often misunderstand this issue, taking advantage of their rights and neglecting to perform their duties and bear responsibility.

Democracy is understood as the rule of the majority, while rights are increasingly understood as the personal property of individuals and thus, as an opposition to the "dictatorship of the majority". The dialectical unity of rights and duties in a democratic society is expressed in the fact that, on the one hand, individuals enjoy the right to freedom of speech, assembly and freedom of religion, which testify

¹³ Aristoteli, *Politika*, Shtëpia botuese "Plejad," Tiranë, 2003, p. 12

to the level of a democratic society. Rights, on the other hand, are not the personal property of individuals, the means or "expression of freedom" to oppose the majority.

Democracy requires cooperation, compromise and tolerance among all citizens. After all, the highest sense of freedom is closely related to taking responsibility for the fate of the individual and the community where he lives, and not liberation from responsibility to them.

Democracy cannot turn all its citizens into exemplary citizens, as by touching a magic wand, but requires citizens to be all responsible for their rights and duties.

The essence of the democratic state depends on the establishment of a mutual relationship between the citizens and the state itself. The picture of these relations is characterized, on the one hand, by the democratic "spirit" and "climate", which guides the need of society for the establishment of democratic norms and laws. These norms and laws are best fulfilled by a rule of law that represents and fulfills the interests of the people.

On the other hand, it is characterized by the relations of citizens with the state, which can be identified with the right of the state to establish norms and laws, as well as the obligation of the citizens themselves to respect these norms.

In a state, true democracy rules only when the laws that govern it, are drafted by its citizens, based on the fact that the community of individuals constitutes society itself, where the inextricable unity and mutual dependence between the individual and society springs.

The distortion of these relations in various areas of a people's life, especially those in the economic field and in the field sharing of material goods, cause irreparable relations between society and the individual.

Lawmakers are generally people mandated by the people, but in many cases they are seduced by the idea of getting rich quick and the privileges they want to provide for themselves. Thus, it is noticed that, no matter how unfounded contradictions that the biggest political parties in Albania show, regarding the reforms in the legal or legislative field, when it comes to defining these privileges, they have always found a common language, surrounding themselves and their families with conditions that would be envied even by the chosen ones of the most developed countries of the world.

Exactly the Albanian democracy suffers from these distortions of relations between ordinary people and their elected representatives in all kinds of powers. Even the philosophers of antiquity had underlined the phenomenon of when the individual can disrupt order and the state, just as the state can harm the individual.

Therefore, Plato, in order to know the honest man and to understand what justice means in that state, advises as the best way to analyze the nature of his state. The historical epochs that man had to traverse in human society are faithfully carried by the history of the birth and development of the state, as a substantial component and cell. So Plato rightly pointed out: "The state is a man of great size."¹⁴ Also, the state, according to him, is a natural institution, because it reflects the structure of human nature. The origin of the state is a reflection of human economic needs, as a state begins to exist because an individual is not self-sufficient.

Conclusions

The above analysis leads us to the conclusion that the state as a political organization is in different relations with civil society and the leader elite. The concept of civil society, although it has evolved, to date does not have a single definition. In antiquity, within this concept, even the state itself was included. The development of society also brought about the evolution of this concept. Later philosophers conceived of it as the result of the union of people or a competing mechanism between individuals with vested interests. Its qualities and features and its role were embodied in American society. In totalitarian regimes they are never understood and recognized. Democratic change in a

¹⁴ Sipas Lee Cameron McDonald, *Teoria politike perëndimore*, Shtëpia botuese "Ideart," Tiranë, 2006, p. 37

country is closely linked to the presence, level and aspirations of civil society, justified by the interests of the people. In any society and political system, civil society is the mirror where one can see the form and content of that society and the political system that governs the political and economic life of the country. Civil society is a citizen society, open, where everyone engages and participates in public and socio-economic life. Its level and activity are basic condition of integration processes.

The state's relations with its citizens and intellectual elites are not in all case agreed. This is explained by the fact that state leaders liked the status quo. the place of their ego for power, after taking this power, is occupied by the desire to run as long as possible and to benefit as much as possible from the power gained. For this, they use all the possibilities, and even draft laws compile according to their interests.

Abstract: The main objective of this paper is to bring a general view of the labor market, employment / unemployment rules and the economic development in Albania, considering the State Budget as a descriptive act that defines all revenue, expenditure and government investment lines in a year, as well as a reserve fund.

It is this study's purpose to focus on improving the current social insurance system through the operation of private pension funds. This would be considered as a first step to the complete privatization of this system. Through this extended study, which discusses several aspects of the matter, we aim to identify economic and social benefits from the existing Social Insurance System.

An analysis of the weak and strong points of the Albanian system compared to worldwide trends, as well as the necessity and importance of private pension funds will be also part of the study.

Taking into consideration the fact that a very large part of expenditures in the Albanian state budget goes for operating expenses (employee salaries or social security health care, among other expenses, which cover public investment spending – infrastructure improvements, investments in public facilities, etc.), we have chosen a study methodology based on surveys and empirical comparisons during the decade 2009 to 2019.

At the end of the research, beyond the results achieved, we aim to present recommendations that will lead to improvement of the existing system and social revenue management.

Key words: labor market, employment, unemployment, public, private, investment, budget, investments, revenue.

1. INTRODUCTION

The pension system is mostly beneficial for the welfare of the employees, their relatives, and the community but also fundamental to anticipate the risk for the future. The system as a whole has a special importance since it regulates and tries to minimize the difficulties for the future.

The pension scheme is structured to cover almost all predicted risks for citizens. Overall, this system works as a contract between the involved parties and also tries to include in the field most parts of society. Pension system is not only a daily discussion topic among economically active individuals and elderly, but also encourages and increases the labor force of a country.

A well-defined system indicates stability and consistency politically and socially. Theoretically speaking, the system offers nothing but benefits. Obviously, many questions arise in order to identify benefits, challenges and also doubts. Systems worldwide differ from one another, always aiming to get better.

This research study seeks to present the public and private pension schemes, reforms, and important moments that this system covers for most of the citizens. The authors, focused on themes and related research studies, aiming to answer and explain if the existing pension system needs a reformation and if it ready for challenges, instruments and technologies for the future.

The study on pension schemes analyzes the current system PAYG, private pension system and also the public and private institutions.

2. METHODOLOGY

The focus of this research study is directed toward Social Insurance schemes in Albania and it is also an effort to understand better both public and private sector. A detailed literature review was done in combination with a statistical analysis to gather open data.

Basically, this research is structured in a certain way that draws many conclusions and suggestions for improvement. This will contribute to analyze schemes and make sure if they provide a good choice for Albanian citizens.

The data collected in this research proved to be very beneficial and revealed many interesting results. The study is focused mostly on people that are in living and are already in a work relationship in Albania.

3. LITERATURE REVIEW

Pension is an issue which has an expanded interest among people. The trends are changing around the world and Albania has also embraced the latest tendency. Actually, we should face some of the major problematic worldwide such as: Pandemic situation, the use of new technologies, globalization, movement plan of mankind etc. In today's circumstances, where life expectancy is increasing day after day and birth rates decreasing, the retirees are increasing faster than labor force.

So, we are facing some big questions. Around the world there are many examples, how different countries have adapted their pension system in line with significant demographic changes they are experiencing. But not all good for a country can be good for another. Pension reforms must be in line with economic, political and social characteristics of any nation.

In the conditions when the Pay-As-You-Go system is failing day by day, the reform seems very urgent and indispensable. Pensions have long been one of the sharpest issues faced by all Albanian governments. They have been a source of criticism by international organizations and have costed the state budget more than 1% of GDP per year, thus preventing the realization of public investments necessary for infrastructure development and the Albanian economy.

Another concern are also the effects they have on creating distortions in the labor market, keeping high levels of informal economy, and so on.

In the literature reviewed (Primer, 2008) according to the World Bank is recommended a four column for the pension system. The first is often known as the zero pillar which means some support for the elderly no matter how much they have contributed, is a publicly administered mandatory pension, typically a definite benefit. The second pillar is an annuity, compulsory, privately managed and third pillar voluntary contribution. A "third-pillar" in voluntary take different forms such as: individuals can save for retirement, disability or death; employer sponsored; defined benefit or defined contribution etc, but essentially is flexible and discretionary in nature. Third pillars compensate for rigidities in the design of other systems but include similar risks as second pillars; and a "fourth pillar", non-financial that includes access to informal support for example family support, other formal social programs (such as health care and/or housing), and other individual financial and non-financial assets (such as home ownership and reverse mortgages where available).

4. RESEARCH DESIGN AND TECHNIQUES

According to the unemployed chronological data collected is included the period 2009-2020, analyzed not only by years and age groups, but also by gender. The main way an unemployed person finds a job for 2009 is asking friends or relatives and another form is by applying directly for another job and contacting the Public Employment Office.

For this period of years unemployment rate explain that male are much more active in the labour market.

Table 1: Unemployment rate by age groups

YEAR	Unemployment rate 15-29 years old		Unemployment rate 30-64 years old		Unemployment rate 15-64 years old	
	Male	Female	Male	Female	Male	Female
2009	26.2	28.3	9.6	13.4	12,2	15,9
2010	23.8	20.7	8.3	14,0	12.8	15.9
2011	25.4	20,9	9,7	11.9	13.9	14.1
2012	31.4	21.9	10.2	9.7	15	12.5
2013	32,5	26,1	10,9	13,1	14.5	17,0
2014	35,6	27,4	17,9	13,3	19,7	15,5
2015	32,3	34,7	12,5	13,9	17,5	17,4
2016	29,7	27,8	11,8	10,2	16,4	14,6
2017	27	24	10,8	8,6	18,5	16,7
2018	29,6	26,0	12,3	11,9	27.5	25,7
2019	29,7	26,1	15.8	13.5	29,4	28,3
2020	27,0	25,9	18.6	16.2	32.5	31.2

Source: Author's calculations

The public social system in Albania has been established since 1991. Social Insurance Institutions a public institution under the Ministry of Finance and Economy represents a consolidated system but still needs improvement as it is a fact that the benefits are smaller compared to the contributions.

Table:2 Income from contributors in Milion All & no. of urban and rural pensions per year

YEAR	Total income from contributions/ million All	URBAN PENSIONS		RURAL PENSIONS	
		FEMALE	MALE	FEMALE	MALE
2011	73,276	173,663	217,293	94,339	63,320
2012	71,545	179,945	220,014	95,173	58,970
2013	75,887	197,630	220,769	97,524	54,500
2014	81,980	201,623	234,714	92,683	56,463
2015	81,524	209,561	244,602	87,942	56,827
2016	80,277	218,863	253,527	85,962	53,192
2017	86,957	227,396	261,012	83,485	49,293
2018	95,955	239,311	269,340	82,202	44,882
2019	98,906	249,755	280,576	80,539	40,669

For the private sector companies like RAIFFEISEN INVEST, SIGAL – Life UNIQA GROUP AUSTRIA, CREDINS INVEST operate in the sector. Beginning in 2019 onwards the company ALBSIG INVEST started operating in the Albanian market, making that 4 companies operating in the private sector, and the research is expand until 2020. In the table below, characteristics of the private system for the period 2011 – 2020 have been gathered and analyzed.

Table:3 Key characteristics of PFs' Market

Period	PFs' members		Total passive members	Number of pension funds management companies	Number of pension funds	Total number of pension plans
	females	males				
2011	2,711	3,584	0	3	3	54
2012	3,460	3,821	0	3	3	65
2013	3,615	4,272	0	3	3	67
2014	3,727	4,764	0	3	3	76
2015	6,626	5,933	0	3	3	97
2016	9,301	8,016	0	3	3	107
2017	11,201	9,746	0	3	3	148
2018	13,422	11,876	0	3	3	182
2019	15,192	13,081	0	4	4	266
2020	16146	14874	0	4	4	238
	85,401	79,967				

Source: Author's calculations

Chart: 3 Key characteristics of PFs' Market

Source: Author's calculations

Table 3 and Chart 3, present the number of members in private pension funds has increased for the period 2011-2020. Also, is noted that the total number of female contributors is 85,401 and the number of male contributors is 79,967.

5. DISCUSSIONS AND CONCLUSIONS

Pension reform should be conceived and designed based on the particular political, economic and social characteristics of a country. While a multi-generational system can undermine international competitive advantages, a very tight system can create social tensions.

The first column, despite the parametric reforms that have been made, continues to be problematic, especially because of the high transfers required by the state budget, the high contribution rates, the weak link between contributions and benefits, low ratios of substitution and high dependency ratios.

The government must continue its efforts to achieve its goals for a progressive increase in pensions with a higher percentage of rural pensions that seek to match the minimum level of urban pensions. If a fully funded system is established without first balancing the current system, this will bring the debt up to the current and the whole system will never work.

Transition costs will be totally unaffordable and the fully funded system will be forced to place all the money on government bonds to finance transition costs that will result in or reduce pension benefits in solidarity system, or cuts in other vital social programs, education and health.

PAYG system is indispensable because it is almost impossible to reject the rights acquired over time by the middle-aged or pre-retirement population, unemployment and maternity benefits, as they offer public goods serving general welfare and should be funded collectively, social protection for the elderly population cannot be exposed to the risk of creating a capital market etc.

Lastly, any reform will be judged by the assembly: well-crafted, timely well implemented with an immeasurable reform that, over time, loses its controversial boundary by becoming convincing and successful. By contrast, a badly drafted, not timely and improperly executed reform would speak of a deficient and irresponsible reform.

System dependency coefficient, which is the total number of beneficiaries in relation to the total number of contributors, shows that Albania has the highest ratio in the region and one of the highest in the world.

Social Insurance Institutions should assume their responsibilities to raise their level contributing to contributions. Regular controls of existing businesses in relation to their contracts and employees would help to avoid contributory evasion.

Designing and implementing some important parametric changes to the Social Insurance Scheme, would aim at making it as attractive to the general public as possible sustainable and financially sound.

Increasing the management capacity of the institution would have an impact on strengthening the organizational structure at the center and on the basis, with the aim of collecting contributions, minimizing contributory evasion and carrying out timely and quality customer service.

Increasing the level of income would have an impact on mitigating the problems in the compulsory scheme of insurance, providing for income individuals enough so that they take the initiative of contributing personally.

It is also important to provide complete information about the existence, the way of fixing and the advantages that accompanying the creation of Private Funds as an alternative to a solution and a secure future.

The government should create easier conditions for accepting the activation of the Private Institutes on the stock exchange, for the purpose of development and support of Private Funds in Albania.

Abstract: New information systems enable the establishment of new management areas like knowledge management. Managing the knowledge, managers at different levels in the organization are allowed to successfully solve problems, using their knowledge and using all other expert knowledge.

Knowledge structuring enables efficient and effective problem solving, facilitates learning, contributes to strategic planning and decision making. Information technology that enables knowledge management in organizations is represented by knowledge management systems.

Knowledge management systems support networks of Knowledge Workers in creating, constructing, identifying, collecting, selecting, evaluating, organizing, linking, structuring, visualizing, distributing, retaining, maintaining, refining, developing, accessing, search and application of knowledge to support dynamic organizational learning and organizational effectiveness.

Information systems are designed to support and manage organizational knowledge that needs to be expanded to help improve the activities and knowledge of individuals as well as groups. To achieve this the information system needs to be rooted in the organization to understand the nature and type of organizational knowledge. Understanding knowledge from different perspectives is very important because it enables easy formation of management strategies and the role of information technology in knowledge management.

Keywords: knowledge, knowledge management, knowledge management systems.

1. INTRODUCTION

The last decade of the last century will be remembered for the rapid development of information technology. New information systems enable the emergence of new management areas, ie knowledge management. Managing the knowledge of managers at different levels in the organization allows them to successfully solve problems, using their own knowledge and using all other expert knowledge.

The main problem that managers face when setting up a knowledge management system is to motivate employees, to contribute, to make their knowledge available, to encourage them to use it freely without fear of sharing it with other colleagues in the organization.

It is necessary to develop a knowledge management system to use one's intellectual capital and the knowledge of employees.

Guided by the idea that "people know more than they think," the problem is how to turn that knowledge into a form that can be made available to other people. The solution to the problem is seen in the structuring of knowledge and the adaptation of that knowledge to be used by others.

2. APPLICATION OF THE KNOWLEDGE MANAGEMENT SYSTEM

Knowledge structuring enables efficient and effective problem solving, facilitates learning, contributes to strategic planning and decision making. Information technology that enables knowledge management in organizations is represented by knowledge management systems (eng. Knowledge management systems).

The initiatives for the introduction of knowledge management systems are ranked according to the most important reasons:

- increase of profitability and income (67%);
- protection of talent and expertise (54%);
- improving services to customers and improving their satisfaction (52%);
- insurance of the organizational part of the market in the fight against the competition (44%);
- shorter time for the introduction of new products (39%);
- entry into new market segments (39%);
- cost reduction (38%);
- development of new products and services (35%);

Knowledge management systems support networks of Knowledge Workers in creating, constructing, identifying, collecting, selecting, evaluating, organizing, linking, structuring, visualizing, distributing, retaining, maintaining, refining, developing, accessing, search and application of knowledge to support dynamic organizational learning and organizational effectiveness.

When it comes to the application of the knowledge management system we need to process the technologies implemented in that system, its management strategies, its processes, and development steps.

Knowledge management strategies

Today we can identify two different knowledge management strategies: codification strategy and personalization strategy.

The codification strategy is most often used in companies that deal with the sale of relatively standardized products that meet the most common needs. According to this strategy, the knowledge is encoded and stored in knowledge repositories which according to their structure are databases from where the knowledge is delivered to the users of the company or the clients. The companies that will implement the personal strategy implicitly accept the model of data storage in the warehouses of knowledge management systems.

Most of the knowledge of enterprises, which has value, is quite explicit due to the standardization of products and services. An example is the companies that perform serial production of products and which did not need to change production techniques and technologies for a longer period.

Companies that have adopted the codification strategy can perform the task of preserving explicit knowledge with a high degree of efficiency, but they still receive very little benefit in trying to preserve explicit knowledge, which, if available, is not useful and has little significance. Despite these facts, larger companies such as Ernst & Young are investing in the codification strategy and system to increase the efficiency of the process itself.

A personalized strategy is accepted by companies that provide solutions to unique problems. In these companies, the knowledge is transferred through the mutual contacts of the employees which are assisted by the methods for collaborative computer work. The knowledge that exists in these enterprises is by nature implicit and as such it is difficult to present, preserve and manage, due to which they maximize the availability of explicit knowledge that shows the way we can reach certain implicit knowledge.

The challenge for companies that adopt the personalized strategy, and thus the network documentation model, is the development of methods that enable the conversion of implicit knowledge into explicit, its storage and transfer from knowledge repositories to knowledge management systems. Several large consulting firms have developed such methods, first storing indicators for experts in the knowledge management system and then advice, procedures, best practices in certain situations, and the contexts in which they have worked. These companies, in order to develop their personal strategies, have

invested in the construction of human networks, communication techniques, and technologies such as telephony, e-mail technology, and video conferencing.

Companies that tried to use both strategies simultaneously (50/50) in their knowledge management efforts generally failed. Companies that tried to implement only one of the two strategies were also unsuccessful. The best combination of these two strategies can be found in the ratio of 80/20%. If the personal strategy is mainly used, the company will need to provide codified knowledge in the warehouses, because in that case, the people in the companies will have access only to the knowledge that is of great importance to their workplace. In the case of using the codification strategy, there is a need for access to people who contribute to the creation of knowledge, due to additional tips and explanations.

Creating a "knowledge" strategy usually contains a methodology that consists of the following steps:

- Problem Identification - Corporate knowledge is often found in isolated systems called knowledge silos. The very way of access and the technological barriers that protect this knowledge lead to the distrust of the users regarding the quality and value of the knowledge that the company owns and keeps. Segments of knowledge need to be identified.
- Preparing for change - this refers to the conditions of business efforts, most often in the way of doing business.
- Team building - most of the companies that have successfully implemented the knowledge management system have created a knowledge management team at the corporate level, responsible for the implementation of pilot projects. This is achieved in situations in which the Chief Officer of Knowledge is appointed as the leader of the efforts undertaken in knowledge management;
- Knowledge mapping - represents the process in which knowledge is identified, finding its place, and finding the individual who needs that knowledge. When the knowledge map is clean, defined, and prioritized, the knowledge management system can be implemented through key features and appropriate identified technologies.
- Creating a feedback mechanism - indicates to the management the ways in which the system is used and notifies him of any difficulties.
- Defining building blocks - used for a knowledge management system. The basis of the structure of a knowledge management system should consist of knowledge repositories, knowledge retrieval and input processes, knowledge retrieval systems, knowledge directory, and satisfaction management.
- Integration of existing information systems - in order to contribute and preserve knowledge in an appropriate format.

When the "knowledge" strategy is set up, the system is developed. Most often in the process of developing a knowledge management system is used prototyping with small groups in pilot programs. If the prototype shows good results, the system is expanded by including employees in it.

Before starting any process of implementation and development of the knowledge management system, as part of the problem identification phase, there is a need to perform a process of revision of existing knowledge. The knowledge audit will show us the level of knowledge that the organization possesses, as well as the flow of knowledge through the company. Such an audit may indicate weaknesses, and thus necessary changes in the organization, organizational behavior, personal behavior, business processes, and technologies in order to use the knowledge to increase competitive advantage. The audit identifies the processes and individuals that act as a knowledge barrier and identifies and selects the actual information that individuals need, delivering it from the best sources. The biggest benefit of knowledge auditing is getting an answer to the question related to the social readiness of the enterprise for transformation into a knowledge organization.

The biggest challenges in implementing enterprise knowledge management systems in practice are:

- Lack of understanding of knowledge management and its advantages

- Lack of time for employees to study knowledge management
- Lack of skills related to knowledge management techniques
- Failure of the organizational culture in encouraging the exchange of knowledge
- Lack of encouragement for knowledge exchange
- Lack of funding for knowledge management initiatives
- Lack of appropriate technology
- Lack of commitment to management.

To overcome these challenges, it is important that knowledge management is not considered a business, and the same process can succeed if the organization successfully follows the intended path of implementation.

In order to be able to successfully implement knowledge management systems, certain resources are needed. Their height will vary depending on the type of system to be installed. The company that will accept the personalized strategy and uses the network storage model will not have to use special tools in the implementation. In general, collaborative computer technologies of knowledge management systems can be operated by IT departments as part of their routine tasks. However, due to the fact that the best enterprise strategy is a combination of the two strategies in a ratio of 80/20%, companies for their knowledge management systems must create a dedicated team that will manage the repositories of knowledge. Companies that adopt the network storage model need minimal storage, which should be occasionally monitored. The contribution of knowledge can be managed with the help of experts working with knowledge.

The situation of the companies that will accept the codification strategy is very different, and thus the storage model. These companies need a team that will be dedicated to the development of the system, as well as the management and maintenance of knowledge repositories. To maintain such a knowledge management system, companies can have one knowledge center with 24-hour working hours throughout the week or several centers that would be geographically distant from each other, which would be reference libraries. Most teams consist of a manager and a knowledge specialist, whose task is to filter and sort knowledge in order to achieve consistency, accuracy, and speed in finding the necessary knowledge, thus helping their clients in finding knowledge. The knowledge specialist has knowledge of the organization of knowledge which minimizes the time for finding specific knowledge. It can send certain information to customers (users), whether they requested it or not.

One of the most common applications of knowledge management is benchmarking in order to convey best practices (KPMG 1998a). For example, An insurance company is facing competition and declining profits. By applying the current best internal practice, through the knowledge management system, the company moves to a more profitable market segment, and thus increases revenue.

Another common application of knowledge management systems is corporate directorate, known as directing internal experiences, potentially useful for application in knowledge management.

A third common application of knowledge management systems is the creation of knowledge networks. In this case, the knowledge management system is less focused on evaluation, ie it aims to gather individual experts from different fields to facilitate the sharing and application of knowledge. Online forums for interactive communication and discussion can form a knowledge network.

Information systems designed to support and manage organizational knowledge need to be expanded to help improve the activities and knowledge of individuals as well as groups. To achieve this the information system needs to be rooted in the organization to understand the very nature and type of organizational knowledge. Understanding knowledge from different perspectives is very important because it enables easy formation of management strategies, but also the role of information technology in knowledge management. In the field of information systems (IS) it is common to create systems based on codified, explicit knowledge. The reporting system, the decision support system, and the enforcement system are aimed at collecting and disseminating that type of knowledge.

3. MANAGEMENT OF KNOWLEDGE MANAGEMENT SYSTEMS

The basic question for management is - identifying the factors that lead to successful knowledge management. It also raises the question of determining the value of the intellectual property of the organization and the value of management knowledge.

Organizations that have successfully developed knowledge management systems can achieve the following benefits:

- reduction of the loss of intellectual capital;
- reducing costs by reducing the number of repetitions in case the organization is forced to solve the same problem and achieve economies of scale in obtaining information from external suppliers;
- reduction of redundant knowledge-based activities;
- increase productivity so that knowledge will be quickly and easily accessible;
- increasing employee satisfaction with the opportunity for personal development and advancement

The key factors that lead to the success of a knowledge management project are:

- connection with the economic value of the organization and demonstration of economic power;
- technical and organizational structure on which it will be built;
- standard and flexible knowledge structure that corresponds to the way the organization does its work and uses the knowledge;
- a culture that values knowledge and leads directly to customer support;
- clear purpose and language in order for the users to want to buy shares from the system;
- change in motivational practice to create a culture of knowledge to be shared;
- multipurpose systems for knowledge transfer;
- support of senior management, which is crucial for initiating projects, for providing funds to determine the necessary knowledge.

A big problem in top managers' decision-making for establishing knowledge management systems is the traditional way of financially measuring values because intellectual capital is not considered a tool. When valuing intangible resources, there are a number of new ways of looking at the capital, such as:

- external relations capital - how the organization connects with its partners, customers, suppliers, etc.,
- structural capital - systems and work processes that increase the advantage,
- human capital - individual ability, knowledge, skills, and other things that people possess,
- social capital - quality and value of relations with the wider social community,
- environmental capital - the value of relations with the environment.

Traditional bookkeeping estimates are insufficient to measure the value of knowledge management systems but are often used to quickly prove the validity of setting up knowledge management systems.

As more and more organizations develop their knowledge management methods, some basic rules become clearer. Success depends on clear strategic logics for sharing knowledge with others, choosing the appropriate infrastructure (technical or non-technical), and removing typical barriers: motivation to share knowledge with others, resources to master and consolidate organizational knowledge, and the ability to move forward the network of knowledge and finding the right people and data.

Organizations often opt for an assumption-based approach that knowledge is a tool when it comes to managing it or one that links knowledge to applications and business benefits. The first approach starts

from identifying intellectual assets, then directs the management's attention to their growing values. The other approach uses so-called balance sheets, where financial measures are balanced in terms of customers, processes, and innovation measures.

There is no system that is flawless. There are many cases of knowledge management failure. Knowledge management failure rates range from 50% to 70%, with failure being when all the main objectives have not been achieved. Failure occurs when knowledge management relies on technology rather than the question of whether the proposed system will meet the needs and goals of the organization and its individuals.

Most organizations do not want to sell knowledge unless it is their core business. The knowledge of an organization is an asset that has a competitive value, and if they leave the organization, it loses its competitive advantage. However, it is possible to determine the cost of knowledge and access to knowledge to pay the organization to sell them. Large consulting firms sell expertise. Their knowledge management efforts, emerging as internal systems, are evolving into value systems that their clients regularly use.

Organizational culture must be shifted to a culture of sharing. This is achieved with the help of strong leadership and provided knowledge management tools that improve human performance. Encouraging the use of systems depends on people being properly motivated to impart their knowledge in order to contribute to a successful business. People should be motivated to use knowledge from knowledge management systems so that it would be part of their work and upgrade mechanism.

4. METHODOLOGY FOR THE INTRODUCTION OF KNOWLEDGE MANAGEMENT SYSTEMS

Knowledge management can be considered an important part of the process architecture in the organization, where the basic preconditions are regulated according to the business processes. For knowledge management to be more successful in the organization, it is necessary to establish organizational and information infrastructure, which would enable the search, creation, and exchange of knowledge in the organization.

Necessary steps and preconditions for knowledge management in the organization according to O'Dell:

- To conduct research where the source of knowledge is located, the flow of knowledge, and the needs for knowledge;
- Creating a strategy for introducing knowledge management;
- Connecting people, ie exchanging their implicit, declarative, and procedural knowledge;
- Understanding knowledge through learning, seminars, and demonstrations;
- Providing people with resources and infrastructure for further progress and discovery of new knowledge;
- Creating repositories of knowledge and providing access to resources that serve to recognize existing and new knowledge;
- Teaching people to exchange knowledge with each other;

Siemens' approach to introducing knowledge management systems in organizations:

- Establishing an interesting group for knowledge management to study other people's experiences;
- Identification and creation of repositories with knowledge (required support of top management and middle management);
- Creating application support for knowledge management;
- Knowledge management outside of ShareNet that includes: knowledge repositories, chat rooms, and search engine or Search Engine;
- Motivating the employees for mutual exchange of knowledge;

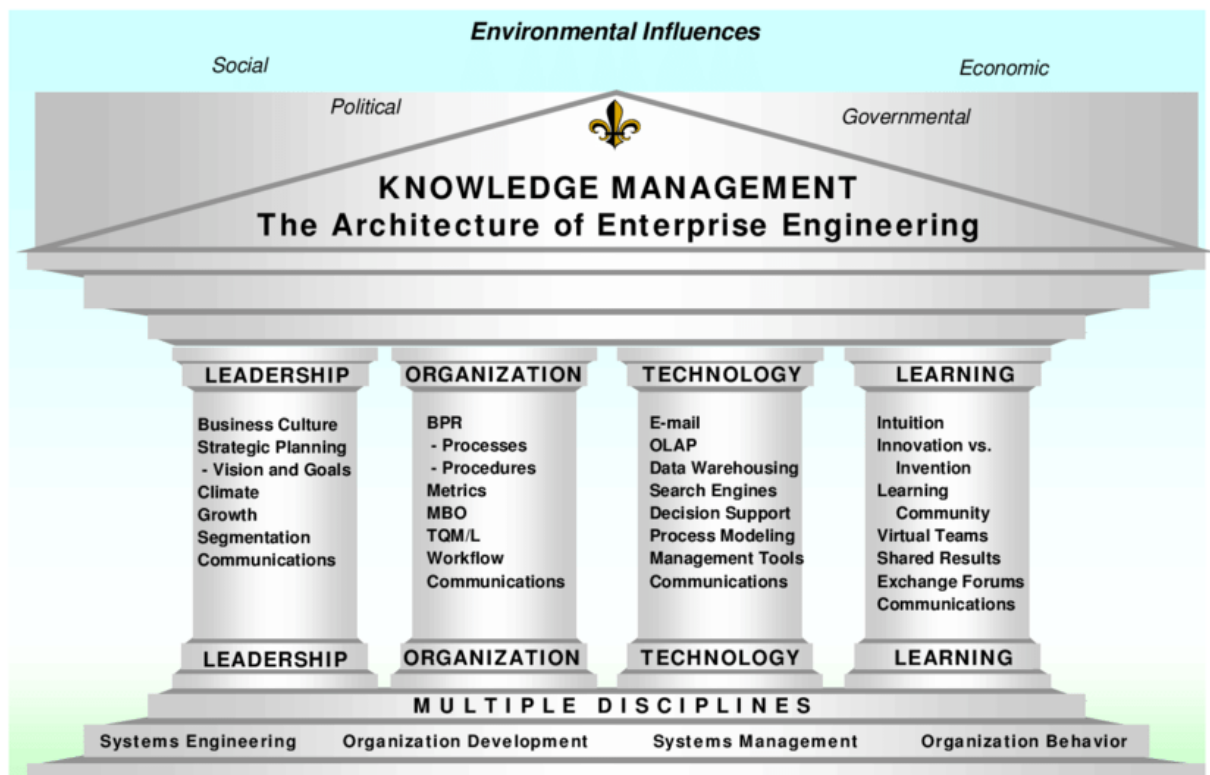

Methodology for introducing knowledge management systems in 12 steps.

The authors' Calabrese and Orlando in their papers give a brief description of the implementation of knowledge management systems based on a case simulation of the use of MS Access and Lotus Notes technologies.

As a result of practice and research we can determine that knowledge management requires four elements:

- leadership
- organization
- technology
- learning

These four elements are the result of every knowledge management system in the organization and from that point of view, we can define knowledge as a key resource for decision making, forecasting, design, planning, then analysis, evaluation, and intuitive judgment.

The four pillars of Knowledge Management (Baldanza and Stankosky 1999)

Knowledge management can be traced through four parts. Each department is responsible for the individual steps of introducing knowledge management systems in the organization. Although management is aware of the importance of knowledge and knowledge management in organizations, only recently have organizations recognized that knowledge should be systematically managed using knowledge management systems in order for knowledge to be a strategic resource and an important factor in the operation of organizations.

The main steps of the methodology for introducing knowledge management systems in 12 steps are:

Part One – LEADERSHIP

1. Identification of the key knowledge needed by the organization - the first step of the methodology that has the task to identify and inventory the sources of knowledge in the organization.

2. Conduct performance-oriented analysis - the analysis refers to:

a) User profiling:

- project manager
- system engineers
- test engineers
- configuration management

b) Products:

- configuration management portal
- reports
- education plan

c) Collaborators:

- project manager
- system engineers
- test engineers
- configuration management

d) Information

- CM Base (CM - Content Management)
- SRMR repositioning process
- project descriptions
- RM advertisers

e) Technology

- computer networks
- Lotus Notes
- MS Access

3. Proposing an action plan to the management - preparation of a study and an action plan for the introduction of knowledge management systems in the organization, which includes a list of activities, charts, actions, deadlines, goals, and resources.

Part Two – ORGANIZATION

4. Involvement of key people and entities - a key factor for success is the selection of a knowledge management team that includes the best people from different areas of work. The knowledge management team should include content analysts, system integrators, developers, testers, and RMO program managers. The team thus formed should be a community of practice (CoP).

5. Development of the model of the knowledge management process - the project aims to create a portal to the SM databases by managing the configuration and partitioning of disks, and thus the system user should not know where the documents and information are located. . Information should be searched using advanced search engines using taxonomy or CML ontology.

6. Identify critical differences in knowledge, opportunities, and risks.

7. Setting goals and priorities - primary goals of the project are:

- a) Providing a reference catalog for the SM database
- b) Providing access to basic documentation
- c) Enabling unique access to control information
- d) Preparation of reports
- e) Enabling simple communication between analysts, configuration management, and users
- f) Providing simple access to the users of the SM database and sharing the space.

8. Defining the needs and making a measurement plan - the goal is to turn implicit knowledge into explicit knowledge with the help of knowledge management systems. Guided by that idea, the goal is to define the needs so that users will have access to knowledge with three clicks on the portal. Also, this new portal should provide quick access to basic documentation and enable the movement of various reports.

Needs can be divided into:

- a) Functional needs - construction of knowledge management systems around the central SM repository which contains basic documents, electronic links, plans, information on project control points.
- b) Management needs - serves to support management processes and workflows
- c) Performance needs - to the desired information through three clicks
- d) Technical needs:
 - use of the existing infrastructure
 - use of Windows operating system
 - use of MS Access as a restricted access portal
 - Lotus Notes e-mail link

Third part – TECHNOLOGY

9. Determining a strategic approach - knowledge exists in two types: we know the subject knowledge ourselves or we know where to find information about it (Samuel Johnson). The steps consist of:

- a) Formation of a Community of Practice
- b) Building knowledge bases on the portal using configuration management resources
- c) Providing education
- d) Collecting feedback from the user with the help of a questionnaire or similar.
- e) Learning from experiences and results, and especially from mistakes

10. Implementation of strategy, construction, and implementation of the solution of knowledge management systems - according to the defined strategy from step 9 can start with the implementation of the solution of knowledge management systems. The collected requests are analyzed and evaluated, and the implementation is divided into two phases. In the first phase, we are working on building a portal, while in the second, final phase, metrics, reporting, virtual checkpoints are added and user access is provided.

The role of the CoR community is focused on innovation, ie the introduction of a portal with links and search engines. It is very important how the entrance page of the portal is designed which must be intuitive and easily accessible.

11. Monitoring, measurement, and reporting according to metrics - a key function of the portal is to monitor the use of individual content. Such information is crucial for the SOR community to manage the further development of the portal and the knowledge management systems as a whole. New user requirements can also be tracked.

Part Four – LEARNING

12. Learning from results and experiences - a common situation in organizations is that there is no edited data on electronic content, and even evident books and other literature are incomplete. In-network conditions, the SM analyst must gather information in his own way and build a guide that will reference the electronic contents and documents. Implicit knowledge is welcome in systems development, but knowledge of SM databases and how to use the portal must be explicit, ie codified in catalogs.

5. SUMMARY

Of all the resources available to organizations, the most valuable in modern business today is knowledge, ie intellectual capital. Because it is obvious that people's knowledge is much greater than what is used in business, there is a need for effective knowledge management. The knowledge that people have can be properly measured and considered as part of the overall values of the organization. More specifically, in the Republic of Macedonia, knowledge is often stagnated or lost due to inappropriate treatment in order to further learning and increase competitiveness. As a rule, knowledge is lost when an individual leaves the business system, due to inadequate cooperation and documentation. The transition of developed countries and some developing countries to a "knowledge economy" has resulted in increased awareness of knowledge as a key indicator of the growth of the national economy.

Knowledge management through the application of the concept of business intelligence is a necessary element in the strategies for successful global business systems. The strategic needs of organizations to create new knowledge reach synergy through information processing with the help of advanced information and communication technologies and the use of innovative and creative capacities that are hidden in human society. The knowledge management process greatly facilitates the process of solving management problems.

Knowledge of modern trends and management tools, as well as their application, is necessary for development, and especially for gaining a competitive advantage, ie for the survival and advancement of business entities in the market.

The business entities that are found in the market today are surrounded by very strong competition and developed distribution channels, and there are many more products and services than necessary. In order to survive in such an environment, it is not enough to be average, but one should aim at the very top. That goes without saying knowledge of how to survive in such an environment. For a good operation of an organization, it is necessary to know how to use the knowledge it possesses and at the same time to know how to manage it in order to achieve a competitive advantage.

In the dynamic development of organizations in the world, it is necessary to keep up with events, and nowadays for organizations, it means mandatory implementation of the knowledge management process in order to increase the competitiveness and profitability of the organization itself.

Abstract: Tourism is a multidisciplinary industry and therefore involves many different stakeholders for its operational activities. An essential active stakeholders in this industry are the tourist guides .The tourist guides play a major role in the tourism industry since tourists need to have a clear picture of the country and its offerings, laws, rules and regulations and other expected behavioural patterns. Moreover, guides should have the ability to transform the tourist visit into an unforgettable experience. Studies on tourist guides in the world are few. In Albania, studies in this field are almost non-existent, because it is a profession developed in recent years. I conduct this survey to see the reaction of tourists on the role of travel guides in growing their satisfaction. This study gives in general, the ancient history of this profession as well as skills and qualities that a tourist guide should have. This research aims to ascertain the role played by tour guides on the satisfaction level of tourists participating in guided tours in Korca region .Another aim of this research is to determine the impact level of tour guides on the possible re-visit intention of tourists to the same destination. Based on 100 completed surveys from international tourists, the findings revealed a significant relationship between tourist satisfaction, re-visiting intention and tour guiding service. Following the evaluation of the findings, recommendations were developed for the tourism industry.

Keywords: tourist guide, tourism, destination, customer satisfaction, customer.

1.1 Introduction

In today's global economy, tourism is one of the world's largest industries. In the last few decades tourism has developed into a complex service industry. Local destinations have to offer only their best in order to satisfy tourists. In that respect, tourist guides represent an important part of the tourism industry. Historically, the tourist guide is one of the oldest activities in the world. Referring to the tourist literature, a tourist guide is the representative of a tourist destination, an "ambassador" in the eyes of tourists. The tourist guide is one of the important factors of the successful presentation of contemporary tourist destinations, influencing the economic and social benefits of the country, city or area where it operates. Local tourist guides should represent the local community and show the most important and the most interesting sights of a given destination. In order to become a tourist guide one must obtain proper education and an appropriate certificate. Taking into account the tourist market needs and incoming tourist groups, tourist guides should be adequately prepared. This paper aims to explain the impact that tour guides have on tourist satisfaction. In tourism studies, considerable attention has been paid to tourist satisfaction that depended on various factors, but relatively little attention has been paid to the effect that a tour guide may have on tourist satisfaction but also on his loyalty to a destination. From the above research there are relationships between tour guide and tourist satisfaction as well as between tourist satisfaction and tourist's intention to return to a destination. Understanding the factors affecting tour guide performance, and the relationship between tour guide performance and foreign tourist satisfaction is considered essential in order to increase competitiveness and develop the tourism sector.

1.2 Scope of the research

The main objective of this study is to identify specific attributes of tour guide performance for improving the foreign tourist satisfaction and destination loyalty in the context of Korca region in Albania . By building on industry, strategic human resource management and customer satisfaction studies, the research will focus on the impacts of tour guide performance on foreign tourists' satisfaction in the

Albanian tourism industry. The research model includes the factors of tour guide leading to gains in the level of satisfaction of tourists. As most of the research in the tourism sector has focused on the perception of tour guide at tourist's approach, this study extends knowledge by examining tour guide performance at the various points of view from tourist to tour guide and tour manager in the Korça region tourism industry. The lack of understanding of impacts of tour guide performance on tourist satisfaction as well as the relationship between tourist satisfaction on tour guide performance and destination loyalty suggested that this investigation is timely in planning for future improvements in Albania tourism industry.

1.3 Research methodology

The research methodology model has a significant impact on the nature and quality of the research results as it affects the validity of the results to the extent that the results can be generalized to other settings. Quantitative research is a methodology that "seeks to quantify data" and "applies some form of statistical analysis", while qualitative research is an unstructured, research-based research methodology that provides small samples that provide knowledge and understanding of problem solving¹. For the realization of this study for itself and the situation in which it was conducted, the analysis of the surveys conducted online was done. The survey contained 17 questions from the destination of the tourists to the age, the reason why they chose Korça, as well as the evaluation they had for the tourist guides and their importance. The materials used are mainly those found online. It should be noted that the information was difficult to find and was available in foreign languages.

1.4 Development of tourism industry

Tourism is one of the most important branches of the world economy. With the development of the aviation industry, with the development of technology as well as with the globalization, tourism only increases. An increasing number of destinations around the world have opened up, and invested in tourism, turning the tourism industry into a major driver of socio-economic progress. Over the past six decades, tourism has experienced continuous expansion, becoming one of the largest and fastest growing economic sectors in the world. With an average annual growth of 5.5%, tourism is the world activity with the highest economic growth. Tourism in 2019 provides 10.3% of total world GDP which translates to \$ 8.9 trillion and there are 330 million people working in this sector. 1.4 billion people carry out tourism activity in 2019 according to the World Tourism Organization. All these figures make tourism the third most important economic branch in the world.² Even in Albania, tourism has received a great development in recent years. Albania has become one of the favorite destinations of foreign tourists, mainly those of Central Europe. According to INSTAT statistics in Albania, the number of foreign tourists is 6 million, a very high number that also brings great benefits that also according to INSTAT to be 45 billion ALL in 2018³. But despite this high development, it is seen that the attention for the employees that enable this growth of tourism is low. Taking the case of the tourist guide, the tourist guide is quite important as he is evaluated as the representative of the respective state and destination. It is a "front line" in the tourism industry that greatly affects the satisfaction of the tourist but also the loyalty that the tourist will have to the respective destination. A quality tourist service is provided by the tourist guide. However, despite the importance of the tourist guide, it has always been left in the "shadow". Therefore in this study the tourist guide will be given the importance it deserves.

1.5 Position of the tour guide in tourism

The tourism industry in the 21st century has taken a very high development. The number of tourists has increased year after year with a number that goes up to 1 billion tourists. Tourism has become a way of

¹ (Malhotra, 2004, p.137).

² WTTC, online available : <https://wtcc.org/Research/Economic-Impact>

³ INSTAT : <http://www.instat.gov.al>

life for many people and as a sector that provides a good share of GDP for many countries. The number of employees in this sector worldwide is about 100 million. These figures show the importance of tourism today. As part of tourism is also a tourist guide. Along with other sectors such as: transport, accommodation units, food and beverage sector, entertainment sector, it is also a tourist guide. The tourist guide in recent years has taken on a high importance. Due to the fact that tourism is already developed more in groups than individually, and a tour guide is much needed. Another reason is the curiosity of tourists for the destination they are visiting, a tour guide would help them a lot in this regard. So the tour guide plays a not insignificant role in this industry. There are many people who appreciate this role and even a researcher has called the tourist guide as the "Cinderella" of tourism.⁴ The position of the tourist guide in tourism is mostly seen in the pleasure that the tourist will receive during the trip, the performance that the guide will give and how likely it is that in the future the tourist will return to the same destination. There is a lot of disagreement about the impact that guide performance has on tourist satisfaction. In a study conducted by Geva and Goldman (1991) investigated about 15 tours in Israel, Europe and the United States, they concluded that in most cases the guide performance did not significantly affect tourist satisfaction during the trip. This study was beyond expectations, because it is widely accepted that the tour guide with the role it has in the development of the tour affects the satisfaction of tourists⁵. The opposite was in the study conducted by Mossber (1996), in this study he found that the tour guide affects tourist satisfaction. To further support this we take the study of Wong (2001) who through surveys concluded that international tourists in Hong Kong are generally satisfied with the guides in terms of their professional skills, customer relations and communication⁶.

1.6 The role of tour guide

According to The World Federation of Tourist Guide Associations (2003:1), a tour guide can be understood as a person who 'guides visitors in the language of their choice and interprets the cultural and natural heritage of an area', and who 'possesses an areaspecific qualification usually issued and/or recognized by the appropriate authority'. Tour guides are frontline employees in the tourism industry who play significant role in drawing tourists to a destination. Tour guiding service is the principal component of tour services offered by tourism companies. Whether tour guides can deliver quality service to tourists is not only necessary to the business success, but also critical to the image of the destination.⁷ A review of some of the key published literature from 1985 to 2014 focusing on the roles of tour guides revealed ten main roles. As shown all eight of the studies identified the role of interpreter and information giver, suggesting that while tourists gain their information from a range of sources, for example signs and brochures, face-to-face interpretation is widely acknowledged in the literature as a key role of a tour guide. Roles mentioned by at least four authors, include navigator/protector, cultural broker/mediator, tour manager, public relations representative and facilitator of access to non-public area. There have been six themes identified in the tour guiding literature over the past 50 years, including (i) the multiple and complex roles and role dimensions of tour guiding, (ii) the role of the guide as communicator and interpreter, including performance, storytelling and intercultural communication, (iii) theory, research and practice relating to the guide's contribution to the sustainability, (iv) visitors' expectations of and satisfaction with their guides and guided experiences, (v) improving tour guide

7 Huang et al., 2010

performance through training, education and professional development, and (vi) conceptualizing and fostering quality in tour guiding, especially through professional associations and guide certification .⁸

1.7 Service quality and customer satisfaction

Service quality has been widely researched, in most cases along with customer satisfaction, and in the fields of consumer behaviors and marketing. One of the most commonly applied theories regarding service quality is the SERVQUAL model⁹. The authors promoted the model by conceptualizing service quality as a construct with five dimensions, including Tangibles, Reliability, Responsiveness, Assurance, and Empathy. The model has been applied to various service sectors, including tourism industry¹⁰. However, when applying this model to the service sector, these researchers seem to agree more on the multiple attribute nature of service quality than the five dimensions in the original model. Service quality has been generally accepted as one of the factors affecting tourist satisfaction¹¹. Also, customer satisfaction has been broadly investigated by researchers and over the years. A number of methodological approaches to the measurement of customer satisfaction have been expanded, but no agreement has yet been proven as the best approach. The literature on customer satisfaction is generally divided into two schools of thought lead by Parasuraman et al. (1985) and Gronroos (1984). The first regarded customer satisfaction as a gap between customers' expectations and their perceptions of a product or service's performance, whereas the second considered customer satisfaction as 'an outcome of the actual quality of performance and its perception by consumers'¹². Customer satisfaction is considered as an essential business goal because it is assumed that satisfied customers are more likely to be repeat customers. Ideally, organizations should attempt to go beyond simply satisfying customers and build customer loyalty.

1.8 Study area

Korca is known as the "cradle of Albanian culture" and is the largest city within the region. Historical documents referencing the city date from the early medieval period - the first half of the XVth century - when Korca province was the property of Muzakajt, one of the feudal families of that time. The city has served as a very important trading market. Throughout the centuries Albanian caravans began their travels from here to Turkey, Greece, and Russia. In the second half of the 19th century, the city rose to be a very important economic, trade and cultural centre. Korca city today remains the most important economic and cultural center in the region. It exhibits eastern characteristics, along with traces of French influence in its urban scheme and grand architectural planning. The first Albanian language school, originally for boys only, opened in 1887 and today it houses the National Education Museum. A separate school for females was opened in 1891. A French Lyceum opened in Korca in 1917 following independence. Korca patriots were well organized from 1906 - 1912, and took part actively in the movement to liberate the country from Ottoman occupation. One of the most famous Albanian

sculptors, Odhise Paskal, immortalized the freedom movement with the monument “National Hero” depicting men descending from the mountains to liberate the city. Korca enjoyed a heightened period of prosperity in the interwar period when many of its characteristic cultural institutions, mansions and boulevards were built. The city of Korca continues to highlight its sophisticated and historic urban values by taking great pride in being a welcoming and accessible city. Visitors can experience this by walking through the city's many parks, clean streets and characteristic cobblestone walkways and roads.

1.9 Why to visit Korca region ?

Here, you will find a wonderfully harmonious combination of high mountains, hills, lakes, fields, culture, art, cooking and deep traditions. Tourist offerings are based mainly on the Korca culture and traditions, which are different from any other place, and are especially enjoyable with the special scenery found in this region.

The region welcomes everybody that loves adventure, nature, and magic. The people of the region have always taken their tradition of hospitality and entertainment seriously, while being committed to easiness and open-mindedness to their guests. Come and enjoy the atmosphere in the area most famous in all of Albania for serenades and carnivals! Come and taste an ideal combination of marvelous nature, lake beaches, sun, mountains and flowers. Take a break from the everyday routine and stress. Come and explore an unknown world!

Korce have many great museums but one of the most interesting is the museum of medieval art! This museum has over 7000 pieces of art and was started in 1980. Entry costs 700 ALL. One of the most important museums in Korca and Albania is the national education museum. If you want to learn more about the Albania culture and language then this is a great place to do so! This building was the first school in Albania which opened in 1887. This museum will show you the struggles of the Albanian language which is so complex and not similar to any other language in the world! Trust me, it's hard as I am studying it right now!

While you're a beer-drinking then you will notice on your time in Albania that you may have the beer called Korca, well that's because it's produced in Korca. There is a brewery in Korca which is popular however despite it being a great thing to do on paper, I do not recommend going there despite what all the guidebooks tell you. The service is very bad. I waited over 30 minutes at a table and was constantly ignored by all the waiters even after calling them several times and them acknowledging I was there. It seems this is a common theme reading the reviews online too. So, instead, I suggest going to a bar within the old bazaar and enjoying a cold glass of Korca while people watching.

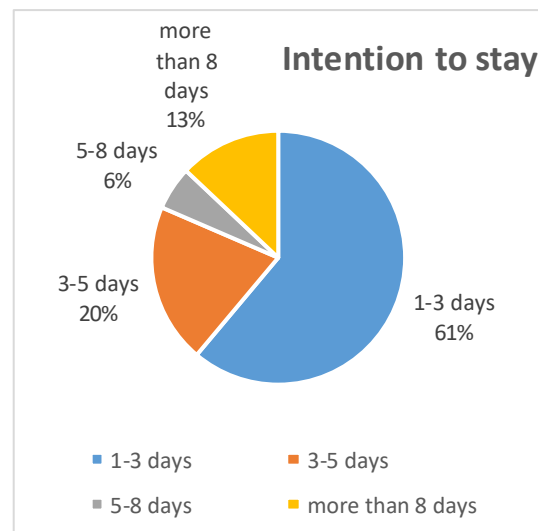

1.10 Tourist markets that visit Korça.

In recent years, the Korça region has become one of the most visited regions by tourists. This is thanks to the cultural and natural potential that this region possesses. In recent years the region has been internationalized with tourists coming from different countries. However, there is no proper study on the tourism market and their origin. This tourist market can be calculated through the investments of key informants such as: travel operators, people working in hotels, travel agents, tourist information offices, etc. Tourists visiting Korça would be divided into the following groups: The group of local

visitors, as the largest group of visitors, 5% of visitors) consists of all Albanians wherever they live in Albania, present not only in the summer season, but also in winter, ie all year round. Most of them come mainly from Tirana, Elbasan, Durrës, in the direction of the city of Pogradec (mainly in summer for holidays), Korça, Voskopoja and Dardha. This group of independent visitors stays in these areas for more than a day, attracted mainly by beach and nature tourism and partly to cultural objects. This group is also the largest number of visitors present at the beer festival and other celebrations during the year. Ethnic Albanian visitors, living in the diaspora (USA, Canada, Australia), are also a group of interesting visitors, with attractions to the birthplace or country of their ancestors. In their visits they are mainly attracted to cultural attractions and connection to spiritual culture. (traditions, customs, celebrations, etc.)The foreign tourist market is part of the group of foreign tourists visiting Albania. It consists of tourists coming from the Balkans, mainly Greeks and Macedonians; from Eastern Europe: Bulgarians, Poles, Czechs and tourists from Western Europe: French, English, German, Italian, Austrian. In most cases they visit Korça through travel agencies, as part of their tour through Albania. In addition to these main groups in the Korça region, there are also groups of tourists who visit the destination for other cultural motives, (seminars, conferences), business motives, etc. Likewise another group of visitors are groups of school students and university students. The latter in some cases are part of teaching expeditions from the country and beyond.

2.General data for the study

Korça region is one of the most visited regions by tourists in Albania. This developed tourism comes because of the nature and cultural heritage that this region has. In this developed tourism also the guide has an impact no matter how small this impact may be. Through this survey we will understand this. In the tourism sector the use of surveys is an efficient method for collecting statistical data and to test the veracity of issues raised in relation to the development of this sector. The results of the surveys have highlighted what this study requires, such as the motivation of tourists and their evaluation about guides.54 questionnaires have been developed, the number is low but the period we are going through is difficult, conducting a survey during this pandemic period was really difficult. I should point out that the questionnaires were not developed in the field but they were developed online. The questionnaires were addressed to persons who have visited Korça at least once, online. Through questions they have given their opinions also online.

According to the respondents, 40% of them will travel with the help of a guide, 19% will travel with the help of maps or GPS, while 34% will travel only without the help of a guide or maps. The surveyed tourists have evaluated the role of the guide in tourism, 85% of them have evaluated the guide as important and very important for increasing their enjoyment during the tour. These are interesting statistics that show the impact of a travel guide, how much impact it has on the tourist, on his satisfaction as well as on his loyalty to a destination.

3. Conclusion

Tourism in Albania is gradually turning into the primary economic sector. Investments in recent years are turning to tourism. Albania is a prosperous Mediterranean country where with a good strategic plan it would become the most visited country in the Western Balkans. As part of Albania, Korça has this potential as both natural and cultural. Korça is the second or third most visited city by tourists after Kruja or Gjirokastra. Tourism will develop even more if the appropriate policies for tour guides are followed. This study has confirmed the relationship among tour guide performance, foreign tourists' satisfaction, and destination loyalty of foreign tourists in a package tour in the context of Korca region. The positive image of tour guide performance is not only positively and significantly related to the satisfaction of tourists but also is one of the factors that determine the destination loyalty of customers. The study, moreover, has proposed a number of suggestions for both tour guide and tour manager/tour operator in order to identify the advantages and disadvantages of tour guide attributes in a tourism company, and then to foster and enhance the performance of employees to reach the higher level of customers' satisfaction as well as their destination loyalty. The suggestions, in addition, also help the policy makers in Albania to set up an innovative standard system of qualifications for inbound tour guide staff that appropriated worldwide standard in global perspective. Tour guide performance, in fact, is not only the factor affects the success of a package tour, but also plays an important role to build the image of the tourism industry in Korca region and more.

Abstract: In the relationship between the manufacturer and the consumer, the trademark plays a central role, because it creates a relationship of trust between these entities.

From the very thought of having a large number of products on the market for which there are no signs of distinction, one can immediately understand the role that brands have in the daily smooth functioning of the market. Without a trademark there is no economic life for market participants. The consumer needs information about the properties of the product so that he can be convinced that this is what he really needs before making a decision to purchase a certain product. The trademark should be remembered and thus associated with the quality of what is required.

A trademark is the most important means by which companies influence consumers to make a choice from among the huge number of products and to opt for the product or service that possesses a special mark called a trademark.

At the same time, through this type of marking, the products receive additional value in relation to the products that are not marked. It is a special sign through which the products and services of one company differ from those of others.

The significance of these issues, as the subject of this paper, will be elaborated through a comprehensive analysis of the functions and types of the trademark, and especially its registration.

Keywords: product, trademark, protection.

1. INTRODUCTION

A trademark is a subjective right of industrial property which as a basis for protection has a mark with which the bearer of the trademark marks his product or service in commercial activities in order to distinguish from the same or similar goods or services of other entities.¹ A trademark protects a sign that can be displayed graphically and which is suitable for distinguishing the goods or services of one market participant from the goods and services of another participant. Words, letters, numbers, drawings, pictures, or combinations thereof can be used to mark a product. In some countries, even advertising slogans can be registered as trademarks before national registration authorities. Many countries allow the registration of trademarks in less traditional forms such as three-dimensional signs (Coca-Cola bottle). But it should also be noted that many countries have their own limitations in terms of what can be registered as a trademark, allowing the registration of only signs that are visually visible or can be represented graphically. In any case, the mark must be eligible for distinction, which would give goods or services a distinctive character compared to other similar goods or services.

2. FUNCTIONS OF THE TRADEMARK

If we look at the opinions of many authors who deal with the issue of the number and type of functions of the trademark, it will be concluded that among them there is no single position on how many and what are the functions of the trademark. However, we can say that they can be divided into two groups,

¹ Slobodan M. Marković Dušan V. Popović, Intellectual Property Law, Faculty of Law, University of Belgrade, 2014, 2p.150.

historical functions - marking the origin of the product and a guarantee of quality and recent functions that have the ability to fulfill the emotional function of customers.²

2.1. The trademark for the purpose of product identification

According to this function, consumers should be enabled to distinguish the product or service from other identical or similar products and services. This is because consumers who are satisfied with a certain product will probably decide to buy it in the future, hence the need to distinguish such a product from other or similar products. The purpose of trademark protection finds its basis in facilitating and accelerating the ability of consumers to make decisions about which product to buy. If certain products do not have obvious differences, and consumers buy them more often, the trademark requires manufacturers to maintain the required quality in order to successfully survive in the market.

- origin of the product - by marking the product, the consumer should be informed about its origin, which can indicate to the consumer the safety of the product in terms of its quality.

-product quality- this feature should create an incentive for companies to invest in maintaining the quality or improving the quality of the product, so that the products retain a good reputation. Hence, the consumer's impression that the purchased product or the received service is appropriate for the declared properties of the product is especially important. At the same time, the expectations of the consumers are met, which is a motivation in the determination to buy a product with appropriate expected quality. The consumer makes the purchase based on his expectations that the product has those properties that are associated with the marked trademark and that that brand always offers the same quality.

-Marketing function-Within the advertising and marketing strategies of the companies, the trademarks have a key role. It should be noted that the well-known brands (Coca Cola) in themselves have a huge value, usually expressed in billions of dollars.

Given the importance that a trademark can have in terms of the success of a product, its proper protection is of particular importance.

- promotional function - as long as the trademark communicates in a positive way, it can greatly increase sales and total sales revenue and services of its holder.

The trademark can be used to market new products or reposition existing ones in a simpler way. The reluctance or at least the reserve of consumers to buy new products is due to the huge number of brands on the market. Introducing new products to the market requires a great deal of commitment to getting the brand recognizable. Therefore, often existing "old and verified" brands / brands that have a good reputation can be used to promote new products.³ After promotional messages that include information about the quality of the product, its characteristics, distribution, operation, servicing and maintenance, only the trademark remains the common denominator for the multitude of product information, so only communication through the name of the famous trademark is sufficient.⁴

- the trademark as a status symbol - the emotional needs of consumers are often satisfied with the trademark, which as a symbol causes a feeling of satisfaction, while creating a sense of security and belonging to a certain group. For the last three decades, the functions of trademarks have undergone a historic transition, so the guarantee function is increasingly being replaced by the status function. The seller does not say "This is better" but the buyer says "This is me".⁵ There are views that the

⁵ Prof. Dr. Vinka Filipovi ', Brand Management, Belgrade 2008 p. 8

replacement of the warranty function with status leads to unnatural demand creation and differentiation of products. Such views are aimed at the fact that through psychological suggestion and even manipulation, consumers are persuaded to buy products with overpriced value which can be found on the market at a much lower price and with the same quality. It is safe to say that today companies do not create value in products, but in brands. For example, the pharmaceutical industry spends more on marketing than on research.

3. DIVISION OF TRADEMARKS

Trademarks can be divided according to different criteria. Based on who their holder is, trademarks can be divided into individual, collective trademarks and certified trademarks. Holders of the collective mark are basically associations of business entities, where with the membership in the association and in accordance with the established rules, the right to use the trademark is acquired.

Certified marks are issued to meet defined standards. These trademarks can be used by anyone who meets the established standards, without requiring any membership.

According to the form, trade marks can be: verbal, musical, graphic, three-dimensional and complex.

National and international trademarks is a criterion according to territorial validity. National trademarks are recognized and protected in the territory of a particular country, while international trademarks are protected within a number of countries that are signatories to international instruments.

According to the type of good that is protected, there is a division of trademarks of products and services. Creating a brand is a critical step, as it can be an important element in a company's marketing strategy.

When creating a trademark, several aspects should be taken into account:

- the proposed trademark must meet the prescribed conditions in order to be registered.
- It is important to create a trademark that contains words that are easy to read, pronounce and remember.
- the trademark should not be confusing or similar to existing trademarks.
- when choosing one or more words for the trademark, the choice of words should be taken into account. Example of whether to use a coinage of words or fictional words. It describes the true meaning of the product or service, it can be easily protected, but on the other hand care should be taken if consumers can easily remember it. There are also arbitrarily chosen words for trademarks, which can be protected, but on the other hand can create problems for advertising, because it is difficult to create an association between and trademark and product or service. Choosing words that suggest product attributes or suggestive trademarks can also be considered as brand advertising.

However, the most important thing in creating a trademark is that it should not be an imitation of an existing trademark.

4. TRADEMARK REGISTRATION

The protection of the trademark is ensured through its registration. With the registration of the trademark of the company, it is given the exclusive right to use it. The trademark can be licensed or franchised to other companies, providing an additional source of revenue for the company.

Trademark registration allows:

- certainty that consumers will be able to distinguish between products,
- represents a marketing tool and basis for building the brand / reputation of the company,
- provides the opportunity for licensing, which is a source of income for the company,
- can be one of the basic components of franchise agreements,

- can be a significant business advantage,
- encourages companies to invest in product quality.

Trademark registration is a condition that gives a company the exclusive right to use it. The registration is done before the appropriate bodies in the national states. Regarding the procedure and conditions prescribed for trademark registration, there may be certain differences from country to country, but there are basically certain rules and conditions that apply in all countries, which must be met in order to be able to register the trademark. The first step is to submit an application that contains company information, a graphic representation or illustration of the trademark as well as a description of the goods or services for which trademark protection is sought. There are countries (USA, Canada) that as a condition for registration of the trademark require the previous use of the trademark for the purposes of the company.

After submitting the application, the competent body performs a formal examination, in terms of whether all the evidence has been submitted or whether the administrative fees have been paid. The essential examination as the next step in the registration procedure means checking whether the proposal for marking is eventually excluded from the registration, ie whether it is in the category of trademarks that cannot be registered, as well as whether there is already a registered trademark as stated in the application. Many countries envisage publication in the Official Gazette before official registration in order to give third-party interested parties the opportunity to object within a certain period of time. Once it is concluded that the prescribed conditions are met, the trademark is registered and a decision is issued, which is usually valid for 10 years. After the expiration of the determined term, the trademark can be extended for an indefinite period by collecting appropriate renewal fees. It should be noted that the trademark can be revoked if it is not used within a certain prescribed period of time (usually three to five years from the registration). This requirement is provided in order to ensure that the registration of the trademark is made for the purpose of actual use in the market, and not to impede its use by other entities.

Trademarks of goods and services are also used as parameters, ie criteria that consumers use in e-commerce. From the aspect that everyone, even on-line or web marketing is based on communication and messages, trademarks of goods and services are an indispensable part of the websites of business entities. When it comes to trademarks of goods and services, in conditions that are characterized by too much information, trademarks of goods and services are a marketing tool for easier navigation of the markets and making decisions to buy again. The offer is bigger, the products are more complex, life is faster, because of which consumers do not have time to collect and study the texts about the goods and services they are interested in. Therefore, they are aimed at certain abbreviations that represent sublimated market information such as the trademark of goods and services. The nature of symbols is especially evident in online marketing due to the reduced capacity of websites, in terms of the amount of information that can be presented to the public, which in marketing terms is still limited by the size of the screen, and now the display on a cell phone.⁶

From that aspect, the trademark of goods and services fully satisfies the needs for efficient economic research. The question that arises in connection with the use of the marks of goods and services on the website is a question of the legally relevant territorial effect of such a mark. All web sites are visible from all parts of the world. The territorial principle on which the trademark is based is the basis for the existence of two identical trademarks of goods and services registered in different countries by different entities-sellers for marking the same goods or services. In case the trademark of the goods and services has a legal effect of international character, then the holder of the right of these marks can request court protection due to violation of his rights. In other words, the international effect of these marks prevents the existence of the same marks which different sellers in different countries have registered

⁶ J.Rowley, Online branding, *Online iformator review* No.2/2004,133.

for the marking of the same goods, in case these marks of the goods are displayed on the websites of their right holders.⁷

The trademark must be used in the commercial activities of the entities that have an exclusive right to it. Otherwise the trademark may be revoked. In a situation where the markings posted on the websites would be automatically recognized as having international legal effect, then that would be sufficient to preserve the rights over the mark in all the countries in which the trademark is recognized. But there are few real global trademarks of protected goods and services today, even when their rights holders intend to present them as global and international, yet they are far from that.⁸ Many local brands cannot become international overnight, because real international trade activities are available to large multinational companies. That is why there is a generally accepted view in law that the mere use of labels for goods and services on websites does not in itself constitute the use of those labels in commerce.⁹ However, this does not mean that any use of trademarks on websites is legally irrelevant. Whether the use of trademarks of goods and services on websites results in a commercial effect, ie the realization of a commercial activity or not, ie whether it can be considered the use of trademarks in terms of the existence of trademark rights, is a factual question and it is decided according to the circumstances of the particular case. In this regard, there is a generally accepted view that the display of the sign of goods and services on the website only separately is not considered the use of a protected trademark on the territory of a particular country in which the law is intended to be exercised or protected, which means that the examination of the circumstances of a particular case is in function of determining the connection between the sign of the goods and services displayed in the virtual space and the territory of the country in its essential material form.¹⁰ The use of Internet tags is considered the use of tags within national borders only when there is a national connecting factor that exceeds the on-line visibility of the sign. The most reliable evidence for the connection of the trademark of the goods and services displayed on the website with the territory of the country, are the commercial activities of the entities on the created site on which the mark is displayed. The sign displayed on the website has the strongest connection with the territory of the country in which the owner of the site carries out commercial activities related to the goods and services for which the display of the signs serves. But the trademarks of the goods and services displayed on the website can have a commercial effect without publishing an activity on the territory of a certain country. The Internet enables businesses to provide uninterrupted reminders even without sales and thus build business success.

Circumstances that are important to determine in which countries commercial effect is achieved by displaying the sign of goods and services on the website, according to the WTO, are defined in four groups:

- the level and character of the business activities of the web site owner in relation to a certain country,
- -the connection between the offered goods and services on the web site with the respective country,
- the connection of the manner of use of the sign of the goods and services with the market of the respective state,
- the degree of compliance between the use of the markings on the website and the authorizations arising from the content of the recognized rights.

⁷ S. Varga, Limited territorial effect of the use of a trademark or service mark on the Internet as a prerequisite for the protection or maintenance of rights, *Proceedings, Faculty of Law in Belgrade*, 2016, p.22

⁸ M.Elsmore, "The implications of intellectual property law for and auditing and protection of national and international brands: Part III. Brands in Europe", *Managerial Auditing Journal* No.5/2000, 222.

⁹ L.Bentley, B.Sherman, *Intellectual Property Law, Oxford* 2004, 893; H.MacQueen, C.Waelde, G.Laurie, *Contemporary Intellectual Property, Law and Policy*, Oxford 2008, 687.

¹⁰ S. Johnson, " Trademark Territoriality in Cyberspace: An Internet Framework for Common-Law Trademarks", *Berkley technology law journal* No.2/2014,1261.

The contents of the websites are globally visible. The trademarks of the goods and services displayed on the website are also globally visible. But their global ubiquity and visibility is not in itself a basis for concluding that they are commercially used in any country in the world. In order for the use of trademarks of goods and services on the World Wide Web to produce national legal effect, it is necessary for the use of the trademark of the goods and services to be sufficiently related to the appropriate jurisdiction-legal competence. The connection exists when with the tag displayed on the Internet commercial effect has been achieved on the territory of the respective state.

Whether an appropriate commercial effect or commercial activity has been achieved is a matter of fact and is assessed on a case-by-case basis. If we start from the two basic preconditions:

- that the use of the signs of the goods and services on the website and on the Internet in general is not in itself considered as the use of the signs in the trade of a certain country and
- the ability to use trademarks in the territory of the respective state to create an appropriate legal effect, is determined on the basis of positive state regulations, it can be concluded that in local-global contradictions of trademark rights and the Internet the principle "wins" of territoriality.¹¹

6. CONCLUSION

Today, consumers are faced with the challenge of deciding when to choose a particular product or service. The tool, if not the most important means by which companies influence consumers in their choice is of course the trademark.

A trademark as a subjective right of industrial property as a basis for protection has a mark by which the holder of the mark marks his product or service in commercial activities for the purpose of distinguishing the same or similar goods or services of other market participants.

The determination for protection of trademarks by their holders finds its basis in facilitating and accelerating the possibility for consumers to decide which product to buy, and thus the right itself gets its economic valorization. Trademarks according to what was stated in the content of this paper can be divided based on different criteria. In order to ensure the economic value of the trademark, the holder of the trademark is required to provide its protection, which is achieved by its registration. With the registration of the company, it is given the exclusive right to use it. Additional economic valorization of the trademark can be provided through its licensing or franchising to other companies which provides an additional source of revenue for the right holder company, which is actually the main purpose of trademark registration.

Econometric Model for the Formation of the Optimal Structure of the Portfolio of Government Securities of Commercial Banks in the Republic of Moldova

Andrei MULIC¹

Chiril GAVLITCHI²

¹PhD in economics, associate professor, Faculty of Economics Science, Department of Finance and Banking, Moldova State University, ID ORCID 0000-0001-6207-1216, E-mail: andreimulic@yahoo.com

²PhD student, Faculty of Economics Science, Department of Finance and Banking, Moldova State University, ID ORCID 0000-0003-4674-9757, E-mail: chiril.gavlitchi@gmail.com

Abstract: Actuality of the research topic is determined by the problems related to investments in government securities, namely, the formation of an optimal portfolio of government securities. State securities are one of the most attractive instruments both from the point of view of the issuer (government) and from the point of view of the investor.

The aim and objectives of the research is to develop the economic and mathematical model for the formation of an optimal portfolio of government securities in the context of the existence of risk of default and alternative investment preferences.

The methodological basis of the research was the works of domestic and foreign economists and practitioners dealing with the problems of government securities portfolio management and investment analysis.

The most relevant obtained results from the research: taking into account the situation on the government securities market in the Republic of Moldova, special attention is paid to the risk of default, methods for assessing the risk of stopping the flow of payments have been developed. The analysis of the factors influencing the structure of the optimal portfolio was carried out, and the main parameters that most fully meet the goals of the investor were determined. On the basis of the investigated information, a model of the optimal portfolio structure was created.

Keywords: investments, investment activity, state securities state securities market risks of bankruptcy (default) economic and mathematical model econometric model.

JEL Classification: C58, G11, G24

1. INTRODUCTION

Investment activity on the state securities market is a complex process that requires consideration of many factors in the modeling process. There are many models that solve the main objectives of investors, such as: forecasting the future value of a security, building a portfolio of the most attractive financial instruments, maximizing the return on the portfolio and minimizing risks.

The state securities market in the Republic of Moldova has a number of disadvantages. However, in a developed market economy, government securities have been and remain the most important financial instrument. Therefore, if the state intends to regulate the economy and influence the economic processes in the country, it will do so not only by creating and controlling the implementation of laws, but also as an active participant in the financial field through financial market interventions. This is fully achieved only after obtaining the status: state as a trusted borrower. Only in these conditions will the state securities market start to function at the required level.

Research is based on the development of the econometric model for the management of a portfolio of government securities, taking into account the new investment conditions in national and international financial markets.

It is therefore necessary to consider all possible events that may occur on the financial market. Therefore, investments in government securities are analyzed taking into account the risk of default, the risk of stopping the flow of payments. It is necessary to research various models of forming an optimal portfolio of government securities, depending on the different preferences of investors, in view of the

changes that have taken place in the world economy conditioned by the influence of the COVID 19 pandemic and previous government deficiencies in the state securities market.

2. LITERATURE REVIEW

Researchers of scientists such as F. Black, Braley, Myers, G. Markovitz, J. Tobin, M. Scholes, as well as economists Burenin A.N., Vatnik P.A., Kantorovich L.V., Lvov Y.A., Pervozvansky A.A, Chetyrkin E.M. are dedicated to risky investment issues.

Investors face the problems of assessing the value of assets, which in turn depends on their risk and return. According to research by Brayle, Mayers, a model is maintained in the market: the higher the potential risk, the higher the expected return. G. Markowitz, J. Tobin pointed out that each investor has his own predictions about market parameters [Markowitz H.M., 1959]. Pervozvansky A.A., Chetyrkin E.M. argues that the market is constantly moving towards a certain assessment of the balance of risk and return on assets. Possible deviations in estimates are primarily related to asymmetric information held by different investors. In well-developed market conditions, new information is quickly reflected in the market value of assets [Sharp W.F., 2003]. Therefore, for such conditions, it is possible to develop a model that optimally describes the relationship between risk and expected return on assets. This model was developed in the mid-1960s. by W. Sharp and J. Lintern and were named the Capital Asset Pricing Model (CAPM).

Therefore, no paper has been published on the issues of hedging investments in government securities through alternative investments in related assets, due to the fact that the issue has arisen very recently.

3. DATA SOURCES AND USED METHODS

The process of creating the model was preceded by an in-depth analysis of all internal and external factors affecting the efficiency and risk of portfolio investments in government securities. The methods of the theory of optimal portfolio, theory of risks, statistical methods and theoretical and probabilistic models were used as a research method. Formation of formulas, verification calculations and the formation of the relationship of factors and indicators were carried out using Excel on a personal computer.

4. THE RESULTS OF OWN RESEARCH AND DISCUSSIONS

In the securities market, government securities are no exception, there are two main types of financial market participants: first, they are organizations or individuals who act in the interest of the client, as intermediaries; the second type are entities that invest their own funds in securities. Therefore, nothing prevents the first group of people to work on the securities market with both the client's funds and their own financial resources.

In the process of managing an investment portfolio, it has to solve two problems. First, risk determination and projected return on the portfolio [Eeckhoudt, C.Collie, 1995]. To do this, he must find out the client's preferences in terms of risk and profitability parameters, tax regime, investment horizon, estimate transaction costs for portfolio formation and management, determine the expected risk and return on assets selected for inclusion in the portfolio. portfolio, the degree of correlation between their returns. Secondly, to determine the real dynamics of portfolio indicators in the process of managing it and, if necessary, to revise it, in the process of selling and buying assets.

In the process of elaborating the econometric model for the formation of the optimal structure of the portfolio, it is necessary to determine the investment horizon and to select the optimal structure in the hypothesis that the risk conditions are stationary within the time horizon. In the next step, when external conditions change, the portfolio structure needs to be revised. The basis of the proposed mechanism for forming a portfolio of government securities is the model for optimizing the portfolio structure.

Government bonds are short-term discount securities with zero coupon, for which the yield to maturity and the maturity date are known. The portfolio consists of different instruments (government securities with different maturities), as a result the flow of payments received is calculated with a known frequency (week, month). The amount of investment funds is denoted by I_0 and the time horizon of the investment is denoted by T . At times $t = 1, 2, \dots, T$ the securities will be redeemed at yield V and the financial resources received are reinvested in X proportions - in government securities, $1-X$ in foreign currency.

The final fixing of securities and foreign exchange earnings takes place at time T . The exchange rate changes with a growth rate noted by C .

The probability of default (D) for the period $t, t + 1 \dots$ is determined based on the estimation of the expected time of default T and takes place mathematical expression: $D = 1 / (T + 1)$

To determine the T value, the Expert Method can be used, but also data on the dynamics of macroeconomic indicators of the financial market: the ratio between the trend of government loans on the government securities market and the trend of the volume of interbank loans. After the non-fulfillment of obligations, the money previously allocated by investors for the purchase of government securities is transferred to the foreign exchange market, there is a sharp jump in the exchange rate. If bankruptcy and default occurs in the period $t, t + 1$, then the rate of increase of the exchange rate instead of $lc = 1 + c$ will be $lcd = (1 + c) (1 + cd)$.

Based on the data on the volume of financial resources that suddenly appeared on the foreign exchange market and the volume of gold and foreign exchange reserves, the value of the cd is estimated - the increase of the rate in case of bankruptcy (default). **Figure 1** shows a diagram of the distribution process for investments in government securities **VMS** and currency **E** at time T .

Figure 1 Diagram of the investment allocation process for T = 3

Source: Developed by the authors

In case of default in the interval **t, t + 1** the income will come only from foreign exchange investments amounting to: $\sum_{t=0}^t E_t^V P_0 (1+c)^{t+1} (1+cd)$

The solution to the problem is to build the dependence of the current expected value of income and the investment distribution policy, therefore from **x**, in the form **V (x)** and the choice **x / max V (x)**.

Therefore, the fixing of income on securities takes place at time **T** only in the absence of bankruptcy, the alternative return for these receipts is the rate of increase of the exchange rate **C**. On the other hand, since foreign currency is a market asset with free transactions, the current price is equal to the present value of its future price at any time **t** under stationary market conditions:

$$P_0 = PV(P_t) = PV[P_0(1+c)^t]$$

Therefore, the present value of a certain amount of foreign currency **E^V**, sold at time **t** is equal to **P₀E^V** or formally with $PV[E^V P_0 (1+c)^t] = P_0 E^V$.

Therefore, we will develop the following scheme for calculating the expected value of the revenue stream (Table 1). This diagram describes the probability distribution of possible incomes, where **q** is the probability value.

Table 1 Scheme for calculating the expected value of the revenue flow

D	$E_0(1 + cd)$
Dq	$(E_0 + \frac{E_1}{1 + c})(1 + cd)$
Dq ²	$(E_0 + \frac{E_1}{1 + c} + \frac{E_2}{(1 + c)^2})(1 + cd)$
Dq ^{T-1}	$(E_0 + \frac{E_1}{1 + c} + \frac{E_2}{(1 + c)^2} \dots + \frac{E_{T-1}}{(1 + c)^{T-1}})(1 + cd)$
q ^T	$E_0 + \frac{E_1}{1 + c} + \frac{E_2}{(1 + c)^2} + \dots + \frac{E_{T-1}}{(1 + c)^{T-1}} + \frac{I_t}{(1 + c)^T}$

Source: Developed by the authors

We will note $\frac{q}{1+c} = \frac{1}{1+r}$, where $r = \frac{D+c}{q}$ – expected rate of return (for an investor - neutral risk).

Therefore, according to the given probability distribution, the mathematical expectation of today's income is equal to:

$$V_0 = E_0 + \frac{E_1}{1+c} + \frac{E_2}{(1+c)^2} + \dots + \frac{E_{T-1}}{(1+c)^{T-1}} + \frac{I_t}{(1+c)^T} + \dots + cd(1 - q^T E_0 + (1 - q^{T-1}) \frac{E_1}{1+c} + \dots + (1 - q) \frac{E_{T-1}}{(1+c)^{T-1}})$$

From the scheme of the process it is observed $E_t = E_0[x(1 + V)]^t$, t=1,2...T-1

and $I_t = I_0[x(1 + V)]^T$. Here the value x (1 + V) represents the growth rate (index). Therefore, taking into account $E_0 = (1 - x)I_0$,

$$(1 - x) \left[1 + \frac{x(1+V)}{1+r} + \left(\frac{x(1+V)}{1+r}\right)^2 + \dots + \left(\frac{x(1+V)}{1+r}\right)^{T-1} \right] + \left(\frac{x(1+V)}{1+r}\right)^T + V(x) = I_0 \left[cd(1 - x)[(1 - q^T) + (1 - q^{T-1}) \frac{x(1+V)}{1+r} + (1 - q^{T-2}) \left(\frac{x(1+V)}{1+r}\right)^2 + \dots + (1 - V) \left(\frac{x(1+V)}{1+r}\right)^{T-1}] \right]$$

$$= I_0 \left[(1-x) \sum_{t=1}^T \left(\frac{x(1+V)}{1+r} \right)^{t-1} + \left(\frac{x(1+V)}{1+r} \right)^T + cd(1-x) \sum_{t=1}^T (1-q^{T-t+1}) \left(\frac{x(1+V)}{1+r} \right)^{t-1} \right] = I_0 [H(x) + Jcd(x)]$$

Therefore, in the process of developing the model for the formation of an optimal portfolio structure using government securities, it is necessary to conduct research on the following expression:

$$\frac{dV(x)}{dx} = I_0 \left[\frac{dH(x)}{dx} + cd \frac{dJ(x)}{dx} \right]$$

$$\begin{aligned} \frac{dH(x)}{dx} &= - \left[1 + \frac{x(1+V)}{1+r} + \left(\frac{x(1+V)}{1+r} \right)^2 + \dots + \left(\frac{x(1+V)}{1+r} \right)^{T-1} \right] + \dots \\ &+ (1-x) \left[\frac{1+V}{1+r} + 2 \left(\frac{1+V}{1+r} \right)^2 + \dots + (T-1)x^{T-2} \left(\frac{1+V}{1+r} \right)^{T-1} \right] + Tx^{T-1} \left(\frac{1+V}{1+r} \right)^T \\ &= \frac{1+V}{1+r} \left[1 + 2 \frac{x(1+V)}{1+r} + 3 \left(\frac{x(1+V)}{1+r} \right)^2 + \dots + T \left(\frac{x(1+V)}{1+r} \right)^{T-1} \right] - \dots - [1 \\ &+ 2 \frac{x(1+V)}{1+r} + 3 \left(\frac{x(1+V)}{1+r} \right)^2 + \dots + T \left(\frac{x(1+V)}{1+r} \right)^{T-1}] \end{aligned}$$

$$\begin{aligned} J(x) &= (1-x) \left[(1-q^T) + (1-q^{T-1}) \frac{x(1+V)}{1+r} + (1-q^{T-2}) \left(\frac{x(1+V)}{1+r} \right)^2 + \dots \right. \\ &\left. + (1-q) \left(\frac{x(1+V)}{1+r} \right)^{T-1} \right] \\ &= (1-x) \left[1 + \frac{x(1+V)}{1+r} + \left(\frac{x(1+V)}{1+r} \right)^2 + \dots + \left(\frac{x(1+V)}{1+r} \right)^{T-1} - q^T \left(1 + \frac{x(1+V)}{1+r} \right. \right. \\ &\left. \left. + \left(\frac{x(1+V)}{1+r} \right)^2 + \dots + \left(\frac{x(1+V)}{1+r} \right)^{T-1} \right] \end{aligned}$$

$$\begin{aligned}
 \frac{dH(x)}{dx} = & - \left[1 + \frac{x(1+V)}{1+r} + \dots + \left(\frac{x(1+V)}{1+r} \right)^{T-1} - q^T \left(1 + \frac{x(1+V)}{1+r} + \dots + \left(\frac{x(1+V)}{1+r} \right)^{T-1} \right) \right] + \dots \\
 & + (1-x) \left[\frac{1+V}{1+r} + 2x \left(\frac{1+V}{1+r} \right)^2 + 3x^2 \left(\frac{1+V}{1+r} \right)^3 \dots + (T-1)x^{T-2} \left(\frac{1+V}{1+r} \right)^{T-1} \right. \\
 & \left. - q^T \left(\frac{1+V}{1+r} + 2x \left(\frac{1+V}{1+r} \right)^2 + \dots + (T-1)x^{T-2} \left(\frac{1+V}{1+r} \right)^{T-1} \right) \right] \\
 = & - \left[1 + \frac{x(1+V)}{1+r} + \dots + \left(\frac{x(1+V)}{1+r} \right)^{T-1} \right] \\
 & + q^T \left[1 + \frac{x(1+V)}{1+r} + \dots + \left(\frac{x(1+V)}{1+r} \right)^{T-1} \right] \\
 & + \frac{1+V}{1+r} \left[1 + 2x \frac{1+V}{1+r} + 3 \left(\frac{1+V}{1+r} \right)^2 + \dots + (T-1)x^{T-2} \left(\frac{1+V}{1+r} \right)^{T-2} \right. \\
 & \left. - \frac{1+V}{1+r} q^T \left(1 + 2x \frac{1+V}{1+r} + \dots + (T-1) \left(\frac{x(1+V)}{1+r} \right)^{T-2} \right) \right] \\
 & - \left[\frac{x(1+V)}{1+r} + 2 \left(\frac{x(1+V)}{1+r} \right)^2 + (r-1) \left(\frac{x(1+V)}{1+r} \right)^{T-1} \right] \\
 & + q^T \left[\frac{x(1+V)}{1+r} + 2 \left(\frac{x(1+V)}{1+r} \right)^2 + (T-1) \left(\frac{x(1+V)}{1+r} \right)^{T-1} \right]
 \end{aligned}$$

The development of the equations presented in subsequent research will make it possible to form an algorithm for forming the optimal structure of the investment portfolio of commercial banks. This algorithm will make it possible, with a high degree of probability, to determine the investment direction of financial funds for commercial banks, in terms of their distribution between government securities and foreign currency, which in this case presents hedging financial instrument for default risk

5. CONCLUSIONS

The analysis of the development and history of the state securities market in the Republic of Moldova shows that:

1. The market of state securities in the Republic of Moldova is not sufficiently stable.
2. In order to work effectively in the state securities market, it is necessary to be sure of the risk, ie the hedging method is used.
3. It is necessary to develop an effective method of minimizing the risks of investments in the portfolio of government securities.

After analyzing and researching portfolio investments in government securities, we can conclude:

1. Classical models (portfolio theory) are not suitable for a portfolio of government securities under modern conditions.
2. It is necessary to develop a special economic and mathematical model that takes into account the risks of bankruptcy (default), which have a force majeure character.
3. It is necessary to research the model of investment risks with force majeure.

4. In the modern conditions of the Republic of Moldova, the foreign currency can be used as a hedging element or insurance for the risk of bankruptcy.
5. The elaboration of the econometric model and of an algorithm for calculating the structure will allow maximizing the value of the investment portfolio for commercial banks.

Two scenarios for the future of Turkey

Blendi Lami

Roland Lami

Abstract: European Union is considered to be a closely connected network of countries that have an integrated cultural and social system. It has enabled several European countries to form a single economic region where they mutually work on economic and political stability of each other. These countries are interlinked through various means, financial, economic, political, cultural etc. Within the EU framework, they have created a strong self-defense and secured environment. The place of Turkey in this context is often unclear, but at the same time there is a tendency of both parties to strengthen ties. This underlies that there are pros and cons regarding Turkey's accession to EU. Amid the ongoing tensions, the too-often repeated phrase "Turkey needs Europe, Europe needs Turkey" is part of the rhetoric not only from Turkish politicians, but also from those Europeans showing support for Turkey's inclusion into Europe's architecture. Referring to these pros and cons, this paper tries to uncover the Turkey–EU relationship and make predictions for the future. It seems that Turkey is not going to be part of EU in the near future. Based on this assumption, two possible scenarios can be foreseen. EU and Turkey will become conflicting parties, or they will be inclined toward collaboration.

Key words: geopolitics, network, security, conflict, collaboration, rivalry

Rivalry

Normally, rivalry is an act of competing, in which the parties lose trust. Without a common framework, the states do not have the guarantees for the implementation of the agreements between them. Only "regimes, in the form of international agreements stipulating rules and regulations of conduct and – at best – allowing for sanctions against those parties that do not comply with the understandings that have been made, can compensate for lack of trust" (Meerts, 2015, p. 55). Therefore, because the accession process has stopped, a new context will eventually lead to lack of cooperation and, worse, enmity.

Before exploring such enmity, we need to consider some hurdles Turkish - European rapport faces.

The major downside of Turkey is the Muslim affiliation it has, and the close connected borders with regions like Syria, Iran and Iraq. Turkey is prone to risky and illegal activities prevailing on the Asian end of the country. Depending on how Turkey conducts its foreign policy, this can also be an advantage. The European Union is analyzing this scenario and jotting down pluses and minuses (Balci, 2015, p. 72 - 91). However, this situation discourages the member states to make Turkey a part of the Europe region. Turkey is attractive from the strategic point of view, as it can use its geographical location, connecting Europe to Saudi Arabia, Iran, Iraq, Syria, Russia and Gulf States (Cohen, 2011, p. 220). These regions are extremely attractive to the world powers for economic development purposes. EU has the opportunity to make the maximum benefit out of integration with Turkey, but just the Islamic connections discourage the member states to accept it as a fellow member (Toci, 2007, p. 29). Therefore, the West's resentment for the country is mainly related to its Islamic affiliations, from which the EU states are threatened by (Aydin-Düzgit, 2012).

Turkey's close borders with the Middle East also make it the center of main security concerns by the EU. The close knitted borders makes it vulnerable to the illegal movement of drugs and humans, access to weapons that are used in terrorism and most generally open to terrorist territories (Morozov and Rumelili, 2012). EU has asked Turkey for support in any fight against terrorism. Its close affiliation with these vulnerable states in such a destabilized area makes it relatively less attractive for the EU region (Baştürk, 2013).

Turkey has been struggling since so many years to become a part of the EU. In efforts to be an active member of EU, it has also worked on resolving its disputed borders like Cyprus and Armenia. The process of normalizing relations with these two territories has been an absolute task for the country (Aydinli and Ozcan, 2011). The idea was to remove the old rifts and forget the past and collectively work on the mutual benefit of all parties. However, numerous efforts have been made, and due to continuous arguments amongst the governments, Turkey has not been able to resolve these matters (Aydin-Düzgit, 2012).

A big concern that the EU states had with Turkey was that if it could abide with EU's norms and if it could amalgamate into its Western values altogether. The perception about Turkey's religious affiliations and cultural bounds, make it unattractive for the rest of the EU states (Hale, 2012). The first and foremost rule for joining EU was that the country needs to have a stable political and democratic system. The political situation of the country is quite vulnerable and there are several incidences of terrorist and criminal activities reported over the past few years. In such circumstances, EU will never open its gates for such a vulnerable state (Aydin-Düzgit, 2012).

Another aspect for not considering Turkey as a member of EU is related to the stereotypical attitudes that the European people have towards Turkish. This can affect the overall functioning of EU altogether (Linden, et. al, 2012). As mentioned before, Turkey is one country that connects Europe and Asia. 99% of the population residing in the region is that of Muslims and the perception about Muslims that the West has created, is mostly negative. Turkey has been struggling enough to make a European identity in the world but its affiliation with the Asian side also compromises its standing in the world. Turkey's close borders with the Balkans, Middle East and the Mediterranean make it the center of main security concerns by the EU.

EU member states will also feel threatened by Turkey's accession to EU due to the problem of refugees coming from Middle East. It is well perceived that refugees tend to bring several fluctuations in the economic as well as the political structure of countries and therefore the influx of Syrian migrants will pose some threats to the countries already in the Europe region. It will give access to outsiders as well, which EU completely rejects (Aydinlin and Ozcan, 2011).

Furthermore, the Muslim majority can have an effect on the West culture as well. It has both, its pluses as well as negatives that will enable the European people to a changed setup altogether. It will get uncomfortable for the practices, traditions and values that are already being practiced in the European region. Toci (2007) argues that "particularly after the attacks on 11 September 2001, Turkey is frequently viewed both by supporters and opponents of its EU accession as a Muslim or 'Islamic' country . . . misperceiving Turkey primarily through the lens of 'Islam' means assuming that Turkey is the 'other'; an assumption which in the long-run could hinder Turkey's European integration" (p. 29).

The factors explained above have blocked Turkey' road toward EU. The situation in questions will lead – most likely - to rivalry, and will radically change Turkish foreign policy orientation. Actually, this approach has initiated. As Turkey was becoming aware of EU's stance, the process of foreign policy shift has already started. Keyman (2017) explains that Turkish foreign policy has changed since Davutoglu's departure. This is reflected – among other things – even in modifying "zero problems with neighbors" with "regaining friends and strategic alliances based on priority setting" (p 66). Keyman notes:

The main principle of the 2002-2010 period – zero problems with neighbors – ended in 2015 and has been replaced by the policy of regaining friends. As new Prime Minister Binali Yıldırım announced at the end of 2015, "Turkey will make a significant effort to regain old friends and make new friends," and crucial steps were made to normalize relations with Israel and Russia. The government also made efforts to improve relations with the Gulf region starting with Saudi Arabia and, most recently, with the Trump administration. The bilateral relationship between with Russia seem to have gained momentum in 2017, which has contributed immensely to the success of Turkey's fight against ISIS and its effort to prevent cantonal state-like development in Syria (p. 64).

In this context, Turkey, facing the fact that full membership is unacceptable to the Europeans, will be looking for friends within EU. Most likely, Germany and France will be excluded from this list.

Considering the European friends, if Brexit succeeds, it will damage Turkey–BE relations, as Britain has shown support for Turkey's accession. Turkey seems also to have lost the support of Mediterranean countries - Italy, Spain, Malta and Portugal - which have also welcome Turkey's accession in the Union, due to domestic economic problems and change of focus from European enlargement ("Which countries are for or against", 2017). Furthermore, Turkey's allies in Eastern Europe have also diverted their foreign policy attention, as they try to avoid Russian influence and are in constant pressure by Germany and France to oppose Turkey's membership (Inal and Yegenoglu, 2005).

Lack of trust between the parties also implies that Turkey will act independently regarding deals with regional and global markets. In the economic domain, Turkey will be also free in choosing allies. Turning East, Turkey will strengthen ties with the near abroad, mainly Caucasus and Central Asia countries. At the same time, as Turkey will diminish relations with EU, partners like Russia and China – and even Iran – are inclined to join ranks with Turkey. For instance, Turkish President Erdogan has declared that he would like “to form a new alliance with China, Iran and Russia to resist economic pressures imposed by the Donald Trump administration” (Lo & Jehong-ho, 2018). This can also happen in a possible rift with EU. Such move weakens Europe, both politically and economically.

Relations with these countries will be mainly based on energy sector. Turkey is currently an energy hub (Winrow, 2006) and in the future could dictate energy policies toward Europe – in Russia’s footsteps. Apart from Russia, Europe will have an additional competitor in Turkey.

Regarding security dimension, this scenario allows Turkey to pursue a unilateral policy with Europeans. With focus on East, Ankara will increasingly become involved in the Middle Eastern affairs (Larrabee, 2007). It is crucial for its own security. It is understandable that Turkey will create alliances in this area, as will try to expand its influence, will reduce the force of Kurds, and will contain Iran or Saudi Arabia in the contest for regional supremacy (Ibid). On the other hand, Europe will be skeptical and worried about Turkey’s orientation. In the event of degradation of NATO’s position, Europe’s security border will be in Bulgaria and Greece, which cannot play Turkey’s role as a “defensive fortresses” for Europe.

With the possible continuous chaos in the Middle East, the waves of immigration from Turkey to EU will increase. This situation is currently very alarming for the EU, which is dependent on Turkey’s policy toward migration. Turkey may put pressure on Europe as it can serve as a transit country (Mortimer, 2016). The agreement of 2016 between the EU and Turkey - which helped limit the flux of migrants entering the EU through Turkey - may be canceled. In this case, Europe will surely face crises with heavy internal consequences.

Based on these assumptions, Kayman (2017) emphasizes that “Ahmet Davutoğlu’s concept of strategic depth and his civilizational, realist thinking of regional and global relations, coupled with the EU anchor, defined the basic parameters of foreign policy” (p. 58). But there is a shift to such foreign policy. And Turkey is no longer a “Pivotal State with Strong EU Anchor”, but a “Pivotal State without a Strong Anchor” (p. 66).

Collaboration

Under a second possible scenario, the EU and Turkey will reach an agreement on cooperation, as both parties will have accepted the fact that Turkey will not be part of EU in the near future. This will pave the way for a framework, on which the parties could work to have trust and cooperate within another regime acceptable by both parties. For instance, according to Ciddi (2018), it would be better if Turkey and EU become only partners, noting that “partnership is better membership, because a transactional approach to bilateral relations — absent of values and wholly predicated on reciprocal demands — has become the new normal for Turkey and the European Union” (pp. 6).

So there is still room for collaboration and they will remain close allies. On Turkey’s side, it will be like an admission to the formerly proposed “privileged partnership”. Even in this state of affairs, Turkey will pursue an independent foreign policy - without the EU’s pressure. At least in the near future, Turkey will have completed the centralization of the presidential powers at a greater level – similar to Putinism. This approach will further undermine the checks and balances system and the proper enforcement of the rule of law.

On one hand, the EU will continue to be concerned about key issues such as Kurdish rights, Cyprus issue, Turkey’s role in the Middle East, and Turkey’s alliances with the US, China and Russia. On the other hand, Turkey will continue to implement a foreign policy influenced by a combination of soft power – with principles promoted by Ahmet Davutoglu - and hard power – the stance of Erdogan and the radical wing of AKP. Kayman (2017) underlines that “since Davutoglu’s departure, Turkish foreign policy has also undergone other modifications – such as “from soft power” to “hard power” and from “multilateralism” to “strategic alliances” (p. 66). In this context, the possible withdrawal of Great Britain

from EU and Trump's anti-NATO policies will set the tone of Turkish relations with the continental Western Europe.

However, despite their differences, since "the economic cooperation between Turkey and the European Union has seen substantial growth in the last decade with increasing investments and bilateral trade volume ("Growing economic cooperation", 2019), the collaboration between both parties is very likely. Being intertwined, the respective economies need further progress. Turkey is currently the fifth largest importer of European goods, and in addition to bilateral trade, Europe is also the biggest source of the foreign direct investment (FDI) Turkey attracts annually (Ibid).

There are several benefits attached with Turkey's rapprochement to the EU.

The attractive and extremely dense market of Turkey paves the way to excessive opportunities to several industries from any corner of the world (Fougner and Kurtoğlu, 2011, p. 353). Turkey has a total population of more than 70 million people and is exposed to extensive cultures of Asia and Europe. The barriers will be reduced and the opportunities will be increased, when catering to the diverse businesses of the Europe, since Turkey is one country which is vastly influenced by the culture of the West preferably (Börzel, 2016). This will be a great move towards extending the trade movement between Turkey and EU member states, and will be profitable for both these regions (Aydin-Düzgit, 2012).

People's mobility can also strengthen collaboration. Turkey has majority of its population in the younger age bracket. Its labor force is young and enthusiastic which can be another attractive aspect for the EU states. Majority of its population falls into the working age and it is most likely to rise in the coming years. Skilled labor specifically is required in all parts of the world. This can further help EU in expanding its workforce and can help in easing the pressures of the working industry overall (Aydinli and Ozcan, 2011).

Turkey has a lot of potential geographically when it comes to its integration with the European region. The aim for Turkey is to turn into a gas and petroleum hub between Asian and European regions. Major pipelines are installed in the country that makes it a centre of transportation of energy supplies between Asia and Europe (Winrow, 2000, p. 49 - 54). There are international organizations that want to decrease the influence of Russia in terms of energy supplies transfer and therefore more pipelines are likely to get installed to transfer energy from Iran, Iraq, and Azerbaijan etc. The main idea of including Turkey in the EU energy infrastructure is to pursue a common vision and work for strengthening the region economically and politically as well (Guzzini, 2012).

For instance, the Azerbaijan-Turkey-EU linkage will be successful through TANAP and TAP, though these lines partially meet EU energy demands. At the same time, as mentioned above, Turkey seeks to become an energy hub and the parties' needs will be mutual. Naturally, more investment in this sector implies less dependence from Russian gas. The Southern Gas Corridor - an initiative of the European Commission for European gas supply through Turkey - aims to reduce dependence on Russia and diversify sources of energy supply. This project "is a major component of EU energy policy. TAP's role in realizing that vision will not only provide economic benefits. It will also ensure that one of the continent's vital energy routes remains viable for decades to come" ("Southern Gas Corridor", 2019). Disruption of this project is of no interest to either side: Turkey would lose the status of an energy hub, while Europe would depend more on Russia.

The energy issue is thus crucial for both parties. But we have to emphasize that Turkey cannot become an energy hub without Europe's markets. As more than 70% percent of the worldwide oil and gas reserves are located in close proximity, Turkey holds a key position to exploit this advantage. Only through profitable contracts with Western European countries will Turkey be able to become an energy power.

When it comes to religion, Turkey's Islamic influence can help in opening the doors of the West for Islam. Ever since the 9/11 terrorist attack that happened in the U.S., it created a negative impression of Islam in the Western region (Morozov and Rumelili, 2012, p. 28 - 48). Turkey's collaboration with the EU can help in building positive affiliations with an Islamic region and change the perception about Islam and its people. This may also help in creating a positive image for Turkey. The extremist view has been exposed to the West, but it's time to see its moderate and well balanced side as well (Cohen, 2011, p.

217-227). And Turkey can take up the role as a facilitator between the different traditions. It can also help eradicate the misconception the European states have of Turkish culture and tradition. Furthermore, Turkey has been struggling enough to make a European identity in the world.

In this scenario, cooperation in the security field will increase. It can be anticipated that dialogue between the parties will be institutionalized even outside the NATO framework. Such policy would bring about bilateral benefits. Strategies in the field of security will serve for the fulfillment of reciprocal interests, mainly in their areas of influence and regions threatening their security.

On the other hand, EU is unsecure like never before. International system is constantly under attack by populist and nationalist forces. As other powers like Russia and China are becoming increasingly aggressive, Europeans' security environment is under threat. In addition, a report produced by European Council on Foreign Relations (ECFR) lists the following current perceptions of threats EU faces: cyber attacks, state collapse or civil war in the EU's neighborhood, external meddling in internal politics, uncontrolled emigration, terrorist attacks, divisions within EU, financial instability, climate change etc, (Denison et al, 2018). Although this report considers Turkey a threat, we have to note that this comes due to divisions within the EU. For instance, the report stresses that "ten countries consider Turkey to be no threat but two others (Greece and Cyprus) see as their top threat" (Ibid).

Following this logic, as U.S. President Donald Trump has shown little interest in the concerns across Europe and has "demonstrated a total disregard for the international agreements and norms that Europeans hold dear" (Denison et al, 2018), transatlantic relationship is changing. Euro-Atlantic Alliance (NATO) has faced criticism by Trump, who has labeled it "obsolete". In these circumstances, collective security is not guaranteed.

Furthermore, a critic voice of NATO's actual status is also Friedman (2019), who says that its mission is outdated and that "there will always be a need for security alliances . . . But NATO is an anachronism that has survived long past its original mission". If Americans pursue this policy, there will be transformation in the Europe's defense system (pp. 11) The first proposal came from French President Emmanuel Macron, who "has warned that Europeans cannot be protected without a 'true, European army'" (Marcus, 2018). In this regard, former Turkish deputy minister Sahin (2018) points out that the proposed European army is impossible without Turkish participation. He makes clear the Turkish standpoint, emphasizing that "European security is inextricably connected with Turkey, which serves as Europe's most important gateway to the east . . ." and ". . . without the participation of Turkey this initiative cannot be effectively pushed forward. Turkey is an integral part of Europe, both historically and culturally" ("Impossible without Turkish participation").

Turkey's strong defense and military power makes it quite attractive to the EU. Its large capacity can make a humongous contribution to the European Defense and Security Policies. Turkey has played a strong role in standing by the West in several wars, ever since the Soviet war, and has been a great ally to the West (Oğuzlu, 2012, p. 229).

Finally, it is worth emphasizing that the collaboration with Europe in the security field is Turkish official current position. According to the Turkish Ministry of Foreign Affairs website, "Turkey is a key regional security player in Europe . . . Turkey, as a founding member of the UN, member of NATO and all European leading institutions, and a negotiating country with the EU for full membership, has pursued a proactive foreign policy to develop friendship and cooperation in its region and beyond."

Conclusion

Turkey, with its independent foreign policy, has openly declared that it is not interested in joining the EU. President Erdogan has declared that "we will not be the side which gives up. To tell the truth, we don't need EU membership any more" ("Turkey no longer needs EU", 2017). Currently, he has consolidated his power in a Putin-style leadership, and from this position he has got free hands on domestic or foreign policy. With current AKP' successes, the Turks do not see Europe anymore as the engine for country's development. Despite being affected by populism and erosion of democratic institutions, mainly after the constitutional amendment of 2016 (the parliamentary system was replaced by an executive presidency), Turkey "has turned from a marginal power into a significant regional

power” (Friedman, 2018, pp. 7). Therefore, the European states and Turkey, with no links in an organization such as EU, have no obligations to one another and can become conflicting parties, any time any crises arises.

However, on the other hand, the scenario of collaboration is indispensable for both Turkey and EU. Turkey is faced with many challenges such as multiplying security threats over a vast geography, refugee crisis of biblical proportions, the problem of ISIS, increased terrorist attacks targeting urban populations, and the mushrooming of “failed states” in the region as potential challenges and security threats, from which Turkey is not immune. In this framework, Turkey will need to align its foreign policy with powerful European countries, because such changes in the political landscape of the region are having a direct impact even in the security architecture of Europe. Therefore, such challenges need to be confronted with a common strategy.

Organizational Change – Definition, Handling, Good Practices

Bochoti Stella¹

¹ Mediator, MSc, Phd Candidate, stellabochoti@yahoo.gr

Abstract: The proverbial phrase that characterizes the philosophy of Heraclitus: «Everything flows, nothing remains», is nowadays more relevant than ever before. Rapid technological developments, globalization, pandemic, conversions, and rearrangements in society are just some of the changes that are taking place in people's lives. In an environment that is constantly changing and transforming, organizations are called, if they want to survive and expand to adapt, by making the notion of change dominant, in their organizational culture. They have to make continuous primary and secondary changes, which will go across the entire structure and function of the organization.

The need for change is faced, not only by private but also by public institutions under the pressure of the growing number of challenges, posed by globalization, decentralization and the transformation of governance, under the increasing pressure of the economic crisis. And whereas, there is a common belief that public institutions, mainly because of their bureaucratic structure and the general perception and culture that regulates them, are negative about any change. However, this cannot continue, as societies are now more demanding and expect more in areas such as education, health, safety, environmental protection, tackling unemployment and many others that concern the modern individual - citizen.

Organizational change is a main factor for the survival and development of any organization, regardless of size, sector (private/ public) or purpose (for-profit/ non-for-profit). Moreover, the factors that trigger the change, can be located both in the inside and in the outside environment of the organization. The key to the successful implementation of change is the individual, who should be properly approached by the actors of change. It is found that every time the person is confronted with something new, without being informed about it, he responds to various forms of reaction.

In this paper are presented and analyzed the mechanisms of support and evaluation of organizational change and also are mentioned some good practices for the management and implementation of organizational change in national and international environment. Specifically, is developed the organization of the change support mechanism, the message of change as a tool of the Administration, the participatory monitoring of the transition plan, the management of change promotion actions, the management of the old culture and the diffusion of the new organizational culture, the evaluation criteria and procedures of change, its practical application. In addition, reference is made to good practices (individual, group, organizational level) in national and international experience. Finally, it is attempted a comparative evaluation of good practices, that leads to suggestions and conclusions.

Keywords: organizational change, good practices, evaluation, suggestions

1. INTRODUCTION

1.1. The Factors of Change

Plenty of researchers have written about the various factors that influence the implementation or processes of change. Thomas (2006), reported a number of variables that influenced the success of implementing a patient safety policy in the Canadian healthcare sector. Adequate resources, incentives for change advocates and persuasive arguments to curb the reactions of those who resist change, as well as incentives for the reactions of multiple stakeholders. In Australia, New Zealand and the UK, implementation units of change have been set up to ensure better execution of policy initiatives through different roles (through control, motivation, consulting, monitoring and performance assessment) (Böhlmark& Lindquist, 2006).

Whether change can be considered a success also depends on the definition of success. For instance, Weissert and Goggin (2002), after research found that the success of the implementation depends to a large extent on clear predetermined goals, such as cost reduction and compliance with change. They consider the satisfaction of stakeholders to be of minor importance and its implementation unsuccessful. A different anthropocentric view of successful change mentions that achieving this

requires more than just a new process, technology or policy. Successful change requires the involvement and participation of those affected. There are many categories of individuals who have portion in decisions about the success or failure of the organization. So, the handling of change, provides the framework for managing the human aspect of these changes.

It is important to determine the stakeholders who are interested in the change or will be affected by it either directly or indirectly. The purpose of their analysis is to be understood what they pursue from a change, what will be the benefits in its implementation, what are the consequences and finally the ways to deal with them. Recent researches lead to a combination of organizational change management tools with individual change management models aimed at effectively implementing any change. One demonstrative way that helps to properly represent those involved is the Power and interest matrix. The horizontal axis depicts the degree of positive attitude or interest with a rating from very positive to very negative while respectively, the vertical axis depicts their power. In this way we can have a complete picture of all those involved in the change.

Figure 2: Power and interest matrix

Source: Journal of Marketing Management, 23(1).

Although organizational change has been studied extensively in recent decades and a number of publications, tools, good practices and change management models have been provided, the results in practice are not particularly encouraging. According to Beer and Nohria (2000), 70% of change programs fail. The results of McKinsey's research, in 2006, showed that only 6% of change programs can be considered "absolutely successful" and 32% "relatively successful". In the same research, they also studied the feelings of employees in changing organizations:

Table 1: McKinsey's Research

	Successful projects (%)	Failed projects (%)
Anxiety	44	51
Confusion	22	43
Indignation	23	44
Fatigue	24	34
Resistance	24	28

Source: Global survey of business executives research, 2006.

It is therefore clear, from the previous scheme that the change in an organization, disrupts the daily life of its employees. Another element of this research is that successful attempts of change it is possible to mitigate the negative emotions of employees, since there has been a better planning and implementation strategy of the program, focused on the goal but at the same time flexible when and if needed.

Worral and Cooper in a 2007 study, claimed that more than 90% of an organization's executives were significantly affected by a change in the organization. This percentage in the public sector reaches at 97%. Percentage of executives who believe that their change has negatively affected:

Table 2: Research by Worrall and Cooper

Percentage of executives who believe that their change has negatively affected in:	
	(%)
Motivation for work	51
Sense of satisfaction at work	48
Loyalty	47
Morale	61
Sense of safety at work	56

There are many factors that lead to the failure of an organization's change efforts, both individually and organizationally. To the main factors are integrated:

Resistance to change

Resistance to change can take many forms, either by lack of support for the change program or by hindering its implementation during the change process. Watson defines it as "the forces that contribute to the stability and maintenance of the existing system". Conner describes it as a normal reaction of those people, who do not want the current state, to be disturbed. Resistance to change is considered a natural reaction of employees, as it can occur due to fear of the unknown, fear of losing acquired rights, insecurity, focusing exclusively on daily work, fear of conflicts and tensions, conscious disagreement with the promoted change, suspicion etc. (Dunaetz, 2020). According to Schein (2004), there are two main sources of stress for employees who are facing a change: the anxiety for survival and the anxiety if they will be able to adapt to the new way of working. Through many studies, it has been found that resistance to change is the main factor in the failure of change programs.

Additional causes of resistance to change:

- Overturn of the existing balance within the organization
- The opinion that change is of secondary importance in relation to other issues
- The opinion that the proposed solution is not appropriate
- Disagreement with the way change is implemented
- Lack of trust to those responsible for carrying out the change process
- Lack of information and communication

The sense of urgency is not created

It is important to develop the feeling in employees that change is right, necessary and timely. The most important step for the success of a change is the Kotter 8-point model (Kotter, 1996; Pollack et al., 2014). If this does not happen, inaction and lack of mobilization of actors in change is possible, and as a result will greatly reduce the probability the forces in favor of change to form a strong alliance that will override those who resist it.

Lack of commitment of leadership/ superior administration

An inviolable term for the implementation of a successful promotional change is the commitment of the leadership. Leadership must support change at every step and every obstacle that may arise. If this is not occurred, it is possible the reform to be incomplete and informal or formal groups to try to take advantage of this new situation without the organization having any positive effect. It is also considered important that the commitment of the management for change being obvious to all employees, something that is lacking in the public sector and in countries such as Greece, where the Public Administration is characterized by a lack of administrative continuity.

It is not created a vision that will inspire the effort to change

Creating and promoting a clear vision that will provoke change is one of the key elements of the reform effort. Kotter (1996), specifically said: "When you can not describe, in five minutes or less, the vision which is responsible for the initiative of change, and you are receiving from others a reaction that shows understanding and interest in it, then you have a problem" (Pollack et al, 2014). Ingstrup and Crookall mentioned in 1998 that the above need fits much better in the public sector, where acceptance of a change will increase when it can be linked to a noble cause that serves the public interest and contributes to society.

Failure to maintain a commitment to change

It has been strongly observed, especially in the public sector, that many reform efforts, while starting with enthusiasm from politicians and public officials, end up stagnating. Most people, while at first show particular enthusiasm for a reform initiative and looking forward to a successful and happy ending, are unaware that their own hard work and dedication is mediating during this change. Kanter (2020), reports that usually in the "miserable middle" of a change effort, everything seems to have failed and employees are ready to give up. It is important during that time, to empower and encourage employees and focus on the change made by them, in order to greatly reduce failure rates. Concerning the public sector reform, the patience of the leadership team (political and service leadership) and the continued commitment to the goals of change are vital, as its results will be seen in the long run and the benefits they often promise often appear long after the end of the change process.

Absence of a team to lead the change

In order for a change to be completely successful, there must be a strong and guiding team. This team will be consisted of employees at different levels and sectors, who have a strong belief in the goals and purpose of the promoted change and who meet the necessary qualifications to inspire and guide other employees to address certain difficulties, challenges and problems that will arise during the implementation of the change.

Neglecting changes in organizational culture

Usually, the emphasis of the reform effort is given only to the hard core of change (i.e., the change of the structures and processes of the organization) and due to the particular difficulty of the intervention, the efforts to change the values, meanings and culture of the members of the organization are neglected, a concept that perhaps has occupied the scientists and analysts more than any other. According to Hofstede, a simple definition is "the common way of thinking that differentiates the members of one organization from another" or simply "the way things are done in here". Thus, since organizational culture determines the way people act, lead, behave, and work within the organization, if the change does not coincide with the necessary changes in the organization's culture, its failure seems more likely.

Lack of required resources (ability to change)

With the term "capacity" we refer to the availability of the resources required to implement change, i.e., time and money, material and human resources. First of all, the resources need to be defined and then, their usability needs to be ensured. A change based on estimates that do not correspond to reality, most likely will not be able to achieve and fulfill its goals, as it will face serious problems and difficulties during its execution.

Deficient communication

Very important is the communication strategy that will analyze why change is necessary, but also the benefits that will arise for each team and the individual separately. The absence of this factor, makes it very difficult to create a climate that will favor alliances in favor of change and will neutralize the forces that resist it. Good practices in Change Management shows that participation and communication, which focuses mainly on explaining the benefits of change, is the most successful strategy for tackling resistance to change. The previous points create interesting expansions for Human Resource Management:

Education

It is needed a coordinated education plan, organized according to the specific needs of each organization. Apart from knowledge issues, what employees need is coaching in issues of cooperation, teamwork, leadership, effective communication. Depending on the change program that an organization wants to implement, it must prepare its members properly for what will happen. Depending on the change program that an organization wants to implement, it must prepare its members properly for what will take place. Group workshops, interactive workshops and opportunities for continuing education, inside and outside the organization, will create a positive atmosphere and enhance the individual and group skills of the staff.

Internal communication

In most organizations the communication takes place "from above" to "below" and takes the form of announcements. The process becomes more difficult when there is a significant change in progress, as it is common for information to be lost, rumors to be circulated, misunderstandings and a bad climate to be created. Management knowledge will give the change agent all the tools to properly streamline the flow of information, take advantage of informal communication networks and save time and effort. Knowledge in management issues will give the change agent all the tools to properly streamline the flow of information, take advantage of informal communication networks and save time and effort.

Selection and employee attraction

Greek public organizations, do not select their employees. However, private organizations, have a numerous options for how they decide to work and with whom. Interviews, project samples, role playing, psychometric tests, all can be used, in such a way, that from the beginning employees, who are open to change, are preferred. One proposal would be the disposition towards change to become one of the criteria for selecting employees in public organizations. This will create a good "base" of employees - potential change carriers - for any future program that management will want to implement.

Staff evaluation

A well-established staff appraisal system will allow the leader or leadership team to understand the strengths and weaknesses of their people. Management will be able to gain a clear picture of the weaknesses that need improvement and set realistic change goals, tailored to the specific skills of the staff. And later, once the change program is implemented, the effective evaluation will appoint, what went well and what did not.

2. THE CARRIERS OF CHANGE

2.1. The Leader

A leadership that is effective, determined and flexible contributes significantly to the success of change. The leader, must create the passion and the attitude for change, to provide persuasion to increase the efficiency of the media involved, create alliances, be able to facilitate the changes that will occur in the organizational culture and identify who will be the winners and the losers after the change, in order to make, in advance, a study can be done in advance to address possible reactions during the implementation phase.

The leader must also find a way to combine two, perhaps contradictory, things: control and trust. He should have the ability to anticipate situations and determine the general direction that will define the context in which employees will move. The political leadership of public organizations is quite different from the leadership of private. Public sector leadership refers to administrative or bureaucratic procedures (Van Wart 2013, Trottier et al 2008). It is necessary in the public sector to support a reform by a competent political leadership, which will guide the change dynamically and effectively in a long run level.

The OECD concludes that "leadership plays an important role in implementing public sector reforms, because it involves two of the key aspects of reform: change and people". Recognizing the important role of leadership in achieving the necessary public sector reforms, several OECD member countries (including the USA, France, Germany, Mexico, Sweden, New Zealand) have developed leadership development strategies for senior state employees.

Administrative leadership can be contrasted with political leadership. The last, concerns leadership activities, carried out by the political supervisors of public organization. Although, the largest piece of the public sector leadership bibliography, does not investigate organizational changes (Van Wart, 2013), some authors focus on the role of leadership in organizational changes. The notion that leadership is a key factor in organizational change processes appears in the bibliography regarding to organizational changes (Kotter, 1996). Leadership, is also considered in the bibliography as a major force of change in the public sector. For instance, Charlesworth et al. (2003), refers that "effective leadership is the key to ultimate effective change". Similarly, Christensen (2005), emphasizes the importance of political leadership and advisers in the process of organizational changes. In addition, Gabris et al. (2001), emphasizes that leadership must be credible and Kavanagh and Ashkanasy (2006), conclude that leaders must be competent and educated in the process of transforming organizations.

The leader is the one who understands when the organization needs to proceed with the change, plan it and implement it. The leader, within an organization, holds the highest hierarchical position, sets the goals of the organization and is responsible for its course (Χυτήρης, 2001; Σταφυλά, 1997). The role of leadership has proved crucial in the course to change. Businesses need a strong leadership presence to achieve maximum efficiency. When leaders are able to recognize and meet the ongoing challenges of the external environment and the changes, they have the ability to create a clear vision, a common goal while motivating all members of the organization to act on it.

2.1.1. How to lead with Organizational Culture as a guide

Lou Gerstner, CEO of IBM, led one of the most successful business transformations in history, saying the most important lesson, he learned from experience, was that "culture is everything." Modern entrepreneurs tend to recognize this and consider it an important point on which they can base their efforts for organizational change. In a survey conducted by the Katzembach Center, 84% identified as a critical point, the business culture, in the success of organizational change. The 64% ranked it in a more important position than that of the strategies of the management models. Several times, change leaders, fail to make good use of organizational culture, either because they neglect it or because they overuse it. Among respondents whose companies were unable to keep up with change over time, a staggering 76% said executives failed to take into account existing culture when planning the transformation effort.

How can a leader, given the widespread recognition of organizational culture, bypass it? Maybe this takes place, because change management designers see their company culture, as a legacy of the past from which they want to move forward. Another version of this question says that change leaders, focus on structural details and formal processes, and forget that people in the organization who have strong ties to this culture can establish behaviors that will lead to the success of change. They also assume that culture, because it is informal and not so strong will be quite adaptable, without requiring significant attention.

Culture is a factor of success or failure proportionally to whether it will show flexibility or inability to adapt to the ever-changing business environment. Organizational Culture is difficult to change, but when will change and adapt to external environmental conditions, it can enhance performance in the most appropriate way Kotter and Heskett (1992). Organizational change therefore means the "transition from one state of affairs to another or the transition from a set of conditions to a different one" (Χυτήρης, 2011), i.e., a process of adaptation and repositioning of human resources in a new environment, in order to be more efficient and its more effective operation.

2.2. The Message of Change as a tool of Management

Leaders, knowing the crucial role of Human Resources in the implementation of any change in the organization, take measures that will enable them to prepare the ground for the business of change to start with the right foundations. Aiming to facilitate change, they do not miss the opportunity to convey their views, beliefs and values around change. They promote and transmit the message of change at every opportunity such as meetings, assemblies, the media and wherever they are given the opportunity in general. They seek the message of change to be passed on to employees through their training, so that they are well and properly prepared.

Initially, they ensure that they have an ally and supporter of the effort to change the top administration. They ensure that there is an identification of views, ideas and beliefs that together everyone fight and strive for common goals and aspirations. To succeed, they configure the new vision of the organization, formulate clearly its new mission, proceed to the strategic planning of change, set long-term and short-term goals. To be more effective, they use examples, symbols and do not hesitate to strengthen and reward those who respond to the call and strive for change. The selection of staff that is flexible and easily adaptable, helps crucially, the quick adaptation of the organization, so that in a short time the signs of change are visible in its operation.

The leadership style that the leader will apply, should keep pace with the principles of change. The bureaucratic model does not conform with these principles, while it seems to be served by the models of Modern Administration, such as that of transformational and distributed leadership. In addition, because the roots of the old culture are deep, the leader's belief in changing the organizational culture, should be taken for granted for a long time and until it is achieved. The leader with clear, understandable, clear and well-prioritized goals ensures the transmission of the right information.

The leader with concrete, understandable, clear and well-prioritized goals, ensures the transmission of the right information. In order to achieve the goals, it is obvious that he will have to look for those incentives that will act proactively to the employees of the organization and push them to their commitment to change. The motivations for the leader, who knows the basic principles of management, are multiple and he is the one who must choose the appropriate ones and the ones he will use for each employee. When there is going to be a change that will affect the whole organization, something that involves a lot of time and allocation of several or even many resources, then it is good to apply the change in one area of the organization on a trial basis.

When there is going to be a change, that will affect the whole organization, something that involves a lot of time and allocation of several resources, then it is good to apply the change in one area of the organization, on a trial basis. The trial change, is based on the belief that in this trial phase, the employees of the specific sector working by implementing the change are better prepared for its implementation and have multiple benefits, such as being able to test their reactions before committing to the new situation, to be able to form their attitude and behavior towards change, based on real data, while overcoming the fear and the sense of threat from the impending change. The Management, also benefits significantly from the pilot change, as it has the ability to evaluate the change approach strategy and make the required changes, before proceeding with its general implementation. In addition, it can make a first and very important finding about the adequacy or lack of resources, required for the full implementation of the program.

In short, the message of change has clear goals, the implementation of which is evaluated on a daily basis. The leader of the organization, has a leading role, as well as the human force that through appropriate training, motivation and implementation of Modern Management is committed to serving change. After all, the process of change must be considered part of the overall strategy and policy of every organization and the human force must know and apply it.

2.3. The Creation of a Common Vision

The change must have a purpose that staff can define. The founder is the primary carrier of elements of the organization, such as vision, values and beliefs. In addition, it has the power to spread them and

make the other members of the organization embrace them. Creating a vision for the future and the consequent goals and values through a broad consensus process, is a very important step, in changing a system. It is necessary to have the support of all stakeholders from this stage. It will inspire and motivate them to take an active part in a discussion about how employees themselves envision the organization in the future. The main questions that need to be answered are:

- ✓ Where are we now?
- ✓ Where are we going?
- ✓ Where do we want to go?
- ✓ How do we get there?

Williams, Dobson and Walters report that "the founder has both a vision and power for the future. He gathers together people, who embrace his views and together create the organization. The common vision must be disseminated to all levels of the organization. Staff and other stakeholders, should feel connected to the vision and understand its usefulness for their own work. They also need to understand, how change will induce personal changes, as well as the workload of behavior differentiation, will serve a higher purpose. A "vision" to be effective must be: clear, unambiguous, relevant to each other's responsibilities, simple, "alive". The absence of a vision that will govern and surround change, linking it to a broader and deeper purpose, makes it very difficult to implement.

2.4. The Workforce

Workforce, is considered not only one of the greatest competitive advantages that an organization has, but also, is the main tool, aiming to achieve its goals. The staffing of the organizations with suitable employees is their main concern, as a result of which more and more attention is given to the adoption of ideal selection methods, for finding and placing the suitable candidates in the appropriate positions. However, the perceptions formed by the candidates about the methods of the selection process and the way they are carried out, have the potential to affect the reputation of the organization and its demand in job seekers.

This fact, is able to make it difficult for the organization, to attract talented candidates.

On the other hand, the involvement of the staff, from the beginning, reduces the reactions to any changes, since you create the belief that he is a participant in this change, he acquires an emotional commitment to the big idea. An additional advantage of such a process, is the dissemination of critical information and feedback, that helps to perfecting the change, during the application. A study by Booz Allen Hamilton, related to government change efforts, found that 75% of successful change leaders, use a collaborative approach to developing and implementing change, compared with 33% of unsuccessful change leaders.

2.5. The Developers of Change

They are the individuals, who turn the idea of change into action plans and programs, in which they state what needs to be done and in what way. These individuals, accurately examine and record the actions that need to be followed, in order for the change to take place successfully. These individuals, either work within the organization or are hired only to accomplish this purpose.

2.6. The Executors of the Change Programs

Executors are the people, who perform some tasks assigned to them by the developers. These people, are involved, in the practical part of change, and can be from any level of the organization.

2.7. The Supporters of Change

Supporters are the people, who support the organization financially, so that it can afford the costs of the change process, or inspire employees to understand how important change is and to support it. These individuals, may be within the organization itself, from another organization, or may be the management of the organization, that makes the change.

2.7.1. The Champions of Change VS the Opponents of Change

Champions of change, are the people who are supporters of change and willing to see it implemented. Whilst, opponents of change, are people who oppose change and may try to prevent its implementation. Organizations, should conduct research on stakeholders, relevant to the analysis and categorization of stakeholders, to identify the individuals and groups to whom the change affects and which exactly they are.

In an organization, there is diversity between employees and stakeholders in general, and therefore different approaches and reactions to change and its implementation. Two categories of stakeholders, are particularly important: the "champions" of change (also known as change factors) and the "opponents" of change. Individuals, in both categories, may come from all levels of the organization. The champions of change, are invaluable in propulsion and legitimation the initiative and team building. They are the ones, who can lead the change from zero to the top.

On the contrary, those who resist change have various reasons for doing so. The main sources of resistance to change, according to the bibliography, are the following:

Fear: Every change, leads to a new situation, which is more or less associated with uncertainty, as to its characteristics and consequences for individuals. This uncertainty, naturally causes to many people the feeling of fear, which makes them react negatively to change (Polychroniou, 2009).

Feeling of loss: In addition to uncertainty, in many cases of change, individuals feel that change, can lead to the loss of valuable satisfactions (such as power, value, utility, work content, prestige) they enjoy in the status quo (Polychroniou, 2009).

Habit: As we know habit leads to inaction, and therefore resistance to changes as it is associated with stereotypes and a sense of "comfort".

Lack of understanding of the usefulness of change: Often in large organizations, many employees, do not understand the direct or indirect usefulness of changes for themselves and more broadly, due to a lack of effective communication from change managers. Therefore, they have no reason to accept and support them (Polychroniou, 2009).

Different perceptions: Organizational changes, are usually the result of values, beliefs, subjective perceptions, assumptions, judgments, goals and choices. It is natural, that there are quite different perceptions regarding them. This certainly leads to denial, passive or active, of those who disagree with the content or the way changes are introduced (Polychroniou, 2009).

Reactions to the sector of change: Several times, the causes of negative attitudes, towards changes, are not the content and their consequences, but the individuals or groups that suggest and attempt changes. The lack of trust and credibility of those who suggest the changes, the symbolisms of the positions they hold, the style of administration, etc. can cause negative attitudes to changes (Polychroniou, 2009).

Table 3: Main sources of resistance to change

1. Habit	8. Inconvenience or loss of freedom
2. Interference with need fulfilment	9. Lack of discipline and persistence
3. Selective perception	10. Organizational structure
4. Economic implications	11. Security in the past

5. Threats to power or influence	12. Fear of failure
6. Knowledge and skill obsolescence	13. Limited resources
7. Fear of the unknown	14. Lack of self - confidence

3. CHANGE SUPPORT MECHANISMS

3.1. Motivations for desirable behavior towards Change

In order to achieve, stakeholder's involvement, they can also take into account, and not omit to provide incentives, in order to produce the desired behavior. The following procedures should be followed for staff and manager: descriptions, annual work schedules, and evaluations should reflect post-change activities and expectations. In addition to annual appraisals, cash prizes and recognition, can help promote the desired change behavior.

In a planned change, and after analyzing the forces that influence it, the sectors - leaders and the programmers of change should, in order to reduce and prevent the negative reaction, to be active and achieve the following points:

Analyze and describe the need for change: some in the organization, are likely to directly express their opposition to change. Their role should be reduced. And this, will be achieved, if on the one hand the need for change becomes clear to them, and on the other hand if they are not pressured to contribute to the planning or implementation of change. If the change, is described as successful, then these individuals will either gradually stop opposing or will want to contribute to the change (Sirkin et al., 200).

One technique, used to deal with these individuals, (usually lower middle managers), is to accept their desire to stay away from the early stages of change, but to be kept informed of its progress. It happens often, that there comes a time when they feel isolated from their colleagues and so they slowly find a way to participate in the program of change. They should ensure participation, in the planning, of those who will be affected by the change: The negative reaction to the change will be less, if those who are really affected by it or think that they will be affected, have some reason in planning it. Their participation, should take place early enough, i.e., before they get the impression that a change will be imposed on them unilaterally. In this way, the chances of compliance and participation in the change are increased.

Provide meaningful and complete information: this is needed to clear up cloudy and complex situations and reduce insecurity. When employees are not adequately informed by change leaders, then they turn to information channels of dubious credibility. The result will be the spread of false news, rumors that will spread fear, doubt and make it difficult or even impossible to implement change. In each beginning of change measures, information should be increased and disseminated both quantitatively and qualitatively. Plenty communication and information, are considered necessary, for the reactions and problems that arise, in the stages of beginning and implementation of change.

Providing the opportunity for objections to be heard: employee's freedom to express their objections, whatever they may be, must be guaranteed. This also contributes to creating a good climate, where employees feel that they can be heard and influence situations, in their favor.

To ensure a broad and active consensus. In the long run, this can be achieved through reward systems, specific policies and administrative practices. However, in the short term, active participation can be encouraged, if the importance of change for the survival of the organization and consequently the securing of jobs, are properly emphasized. Moreover, if a "common vision" is created for the organization, and the interest is focused on dealing with the "competitors" of the organization, to cultivate the feeling of trying to survive in the "market", trying to deal with the "enemy" together.

To take into account team standards and habits. Our well-known business culture, as mentioned above, is very important for the proper and successful outcome of the implementation of change. To do, as many changes, as needed. Everyone has a limit to accepting change, beyond which they react negatively, even if they do not see any negative effects on change. Every person, has a limit, in accepting changes, beyond that he reacts negatively, even if it does not discern negative effects on change. This will have the effect, that the person, will not be receptive to serious changes, if he is already tired of the insignificant ones.

To provide incentives. Change, is more easily accepted, when it gives people motivation to meet, some of their needs. Employee motivation theories, make it clear, that motivations are necessary for individuals to take action, in specific directions and to adopt the required behavior. To handle time, properly. The appropriate time should be taken into account to enter the change. The appropriate time, is the period of time in which, the work climate, the availability of resources, and internal and external forces, help to achieve change. The effects of the change, are not immediately visible, nor is it considered appropriate to evaluate its effectiveness immediately after its beginning.

It takes time to achieve change. At first, there may be disappointments or even failures, even quite positive results may begin to appear, which are expected. That is why, those in charge of change, should not make hasty assessments, which will concern the difficulty of implementation or the low feasibility or even the final success of the change. They should monitor and control the implementation of the change, and wait for the final results to be visible. To make any necessary adjustments to maintain the change.

3.2. Communication at all Levels

Communication is one of the most important elements in the effort for a successful change, it predisposes employees positively, giving a tone of transparency and honesty. Proper communication can serve a large number of functions, including:

- conveying the vision, goals and motivations for change, exchanges information on organizational changes and provides stakeholders with details about nature, timing, and significance of the change,
- extracts participation and action in specific actions from stakeholders,
- provides the social support, needed to address problems, alleviate emerging fears, and establish support systems among employees,
- provides feedback to both employees regarding to their performance and the initiatives they take during the change process, as well as to the pioneers of the project (of change) regarding the strengths and weaknesses of the process.

Consistent communication is important for maintaining and enhancing key messages, which should be linked to achieving higher goals and a vision for change. Senior executives and "champions" of change, should act as intermediaries in enforcing these key messages. Furthermore, organizations can use in-person communication, where is possible, to build relationships with stakeholders. Communication, is also an effective method, to help people overcome their resistance to change. In conclusion, the communication should be repetitive and diffuse through multiple channels, include opportunities for questions and comments, to be adapted to specific recipients.

According to the results of the communication policy, pursued by Usaid Assist Project in various organizations in America, when communication is done through multiple and different internal and external channels, the maximum interaction is performed between the transmitter and the receiver, i.e., those who plan the change and those who can afford it. For example, the organization has used announcements, emails, websites, reports, presentations, face-to-face meetings, seminars, and informal discussions. The executive teams, worked on the communication protocols within the organization, so that the sender of the message and the target of the message, have a direct and fast result and maximize the effects of the message. The telecommunications implementation team, sent a message to all interested members, before installing the system, so that they know, in advance, that a big change

was going to happen. The communication continued, and after the implementation team left, asking users if they needed any help. The Usaid Assist, obtained the following important information: it is necessary to offer, to the interested parties, up-to-date and reasonably organized information, in order to obtain, the most of the communication.

The communication must be in a form in which the interested parties pay attention, and the message of the communication, should be such, that the interested parties identify and perform the best of their possibilities. The USAID experience, also reveals that efforts were ineffective, when senior executives distanced themselves from the messages they had to spread to the functional units.

3.3. Creation of the Infrastructures to Ensure Success

Differentiating a company's organizational patterns, attitudes, and culture is one of the most difficult aspects of managing change, but it is also one of the most important. The process of change, takes a long time and for this reason many synergies are needed that are oriented towards the same goal. Senior management and functional units, must work together to create the right environment and provide the tools needed to move the process forward, in the long run. Education is vital to familiarize stakeholders with the details of change and how they are applied in their work. Through learning, staff gain a deep understanding of how their behavior needs to change, the ultimate benefits to the organization, and the skills needed to effectively establish change.

Taking into account the diversity of stakeholder capabilities, organizational change efforts may require a significant investment in staffs and partner's education. Senior leaders need to take their qualifications seriously, in order to be committed and maintain their skills for a change, whose effects will begin to show, in the long run. This also includes the appropriate staff, the right amount of time, the space and required equipment, as well as ongoing funding. Failure of an organization to allocate sufficient resources, can prevent substantial change. Senior leadership, should also consider its ability to use resource management, in the process of change. External consultants or experienced people from within the business, may help the functional units to embrace the principles of change management in the design and implementation of the initiative. In conclusion, in order to enhance change, these three factors (three organizational structures) should contribute: Policies, Procedures, Systems.

3.4. New Technologies as Mechanisms to Support Change

The integration of e-government applications, is a key linchpin of initiatives to reduce administrative burdens and inventory administrative procedures. It focuses on two linchpins of intervention: the redesign and digitization of public administration support centers and the decentralized and integrated provision of services to citizens and businesses.

Hermes is the Central Internet Portal of the Greek public administration. It was designed with the aim of being the National Benchmark of the Greek e-Government and is expected to function as a comprehensive platform, which will provide information and electronic services to citizens and businesses through digital transaction and communication. The purpose of creating HERMES, is to become the "router" that will facilitate and direct, those interested, in the appropriate places. Thus, the existing public websites of public sectors, will not be abolished. They will retain their autonomy and content, and will simply need to be redesigned and connected to the HERMES National Portal. Operational barriers and the lack of interconnection of information systems should be replaced by the development of an undivided and interoperable information system for all public sectors, which will include codified and modeled support procedures such as staff status and payroll, internal and external correspondence, budget, expenditure and notifications, among others.

In Denmark and Finland, for the last five years, the interoperable homogenization of the existing information systems of public sectors and the modeling of the procedures - levels of control and provision of information and service, have been the basis of the broader administrative and reorganization programs. At the core of the strategy, should be the development of a common and standardized system of bidirectional communication, between citizens and businesses with stakeholders

and the provision of integrated digital services. Alternatively, for the central government, a joint e-government service hub could be developed, between the agency and the Ministry, and a policy or population group, a model that is gradually gaining ground with already successful applications, in countries such as Australia and Canada. For example, new social media and mobile devices, mobile phones and tablets, are helping by their use and furthermore with exciting new features, to enhance transparency and reduce bureaucracy.

The technology, serves the creation of virtual work environments, as employees will be able to work remotely and with flexible schedule. Employees, no longer need to work in the same workplace and at specific hours when not required, thus increasing their productivity. This way, employees will no longer have to live or reside in the same area as the service, but will be able to work even from abroad. In this way, the geographical range of people who can work grows, opening the borders to more capable and talented people.

It is considered necessary to systematically record data related to the operation of Citizen Service Center (CSC), which is a service for Greek citizens, such as the number of procedures they apply on an annual basis, the number of "customers" they serve, their operating hours, the ownership status of the property in which they are housed and the price of the rent if there is, the number, the employment relationship, the level of education and the language learning of the employed staff, the operating expenses of each CSC, as well as its payroll expenses and, finally, the potential population that each CSC serves. A multi-parametric evaluation of the CSC, that will take into account all the above parameters, is necessary to support the strategic decision-making on how the CSC evolves, especially after the requirements arise through the planning for a staff state, which predicts for the transfer of service responsibilities to other levels of administration from the central state.

In the Netherlands, the Citizen link service, is an online application that measures the degree of satisfaction of public service users, per sector, and evaluates their views on the impacts of the provision. A particularly innovative system is the digital "journey" of service delivery, according to which registered users in a digital simulation environment, evaluate specific qualitative and quantitative characteristics of the provided services. The effects of the changes which they propose, can then be assessed through the modeling capabilities provided by the simulation system. The results obtained are used in combination with the operational data of the services provided, in order to select their simplification actions and the development of the operating model of the competent body. The results that are obtained are used in combination with the operational data of the services provided, in order to select their simplification actions and the development of the operating model of the competent sector. This standard operating regulation, lists the requirements for receiving each service, the stages and distribution of responsibilities, the time of completion and the required forms, to be completed. The junction, also functions as a expedient of consulting on the quality of the provided services, evaluating simplification actions and recording proposals.

In the case of Greece, the problems and the absence of extroverted and interoperable planning of the existing information applications, creates the need for a radical reorganization of the policy, with a view to drastically reducing bureaucracy. But the most important problem of e-government policy, is the lack of interoperability, friendliness and extroversion of applications. In the Greek central public administration, there are over 350 ICT applications, a part of which concerns integrated information systems (OPS), and 3,084 servers with minimal to non-existent interoperability and technology of design of their applications.

3.5. Measuring Progress

Vital Questions, are the following:

- Who will collect and analyze the data?
- How and when are the data collected?
- How will the organization utilize the results?

Organizations need measurements to evaluate the results of the progress of the process and the change itself. Measurements and reports, provide useful information to organizational units, in order to understand whether stakeholders perform those tasks that contribute to change, as originally planned. This allows them to make corrections where they are needed. Evaluation and monitoring, should be continued, after the change is implemented to ensure that the organization has not succumbed to old mentalities. Finally, with the publication of the results throughout the organization, the change is consolidated and the messages towards the ultimate goal are strengthened.

3.6. Participatory Monitoring of the Transition Plan

The way an organization effectively combines its interconnected activities, is what determines its overall performance. The public organization, implements its mission and vision, through a clear strategy. Strategy translates into plans, aspirations and measurable goals. Planning and strategy, reflect the organization's approach to implementing organizational change. Creating and implementing a transition plan, is a prerequisite and is a concise roadmap with guidelines for smoothly managing the changes that inevitably arise from the beginning of operational flexibility and organizational innovation practices in an organization, with a view to reducing implementation uncertainty, taking into account the reduction of implementation uncertainty, the need for a framework to monitor the progress of the integration of new practices and ensure the final implementation of possible new organizational structures, processes and methods with the least possible impact on its operation organization. It should also include, a monitoring and self-assessment mechanism, that is likely to lead to reorientations.

Workforce, is one of the key factors in the implementation of a change plan and should be utilized in monitoring its implementation. The participants in the change, monitor, record, measure and in scheduled meetings evaluate, at regular intervals, the implementation of the transition plan. Participation, strengthens the belief in change, develops and releases all the skills of employees at the individual and organizational level, to support the strategy of change, its planning and the effective operation of its processes. Secondly, from the above arises the need to provide more freedom to employees, so that they are able to actively participate in the process of defining the goals, that they will be called to achieve. Third, the change extends deeper than a simple technological upgrade. Change, primarily, involves creating a new culture within the organization through new skills and attitudes. Fourth, practical application is a cornerstone of any change program.

Change plans are designed by the top management team of the organization but the implementation is the subject of employees in the middle and lower layers of the hierarchy. If there is a lack of alignment of all employees in the effort to achieve the goals of the change program this cannot be achieved. In addition, as discussed above, most change management models, suggest the design of specific tasks per employee for the most effective implementation of the change plan. In conclusion, these four elements have in common the involvement of a large number of employees with commitment and motivation in the change program (Θεοδωράτος, 2004).

In conclusion, the contribution of employees to the effective outcome of the attempted change is vital, from the initial stage of design to the final. At this point, it is important to emphasize that the commitment of employees to change is long-term until their departure from the organization.

3.7. Criteria and Procedure for Evaluating Change

One of the most important steps in the change process, is its evaluation. By evaluating change, the effectiveness of what was planned and implemented, is studied. Before the start of any change, it is a prerequisite for the existence or creation of a reliable and effective system for evaluating the expected results. The lack of such a system, is often the reason why a change fails. The evaluation process, often requires the cooperation of experts, who usually come from the external environment of the organization, so that the research is objective and the application of specific methods and quality standards (e.g., ISO 9000, Balance Scorecard, Six Sigma, etc.). It is a precondition for conducting these researches to observe the rules of research and ethics in accordance with the respective international and national contexts (Jones & Powers, 2004).

The evaluation of change, is done at specific and defined time points and requires the appropriate provision of evidence and data, which are collected through different means and ways, such as information systems within the organization, questionnaires or interviews with interested members (e.g., customers, employees) and other methods. In addition, effective evaluation of change, requires continuous and good communication, between management and all members of the organization involved in change. The client and the competition, play a decisive role, in the evaluation process. The modern business environment, is dominated by the effort of all organizations, to achieve maximum customer satisfaction by offering the best possible value proposition. Thus, the success of change, to a large extent, is determined by the customer response (Kotler, 2000).

Evaluation of change, must be done before, during and at the end of the implementation of a change plan. The action plan of the organization must be formulated, taking into account all available information about the competition and the customer database. This will ensure the selection of methods that can lead to the most effective achievement of the goals set by the change program. In the same context, the evaluation should be based on the monitoring of specific issues / factors that help in the comparison (Benchmarking), with competing organizations, but also show the discrepancies between the results and the initial goals in order to identify in time the points that need improvement (Brooks, 2009).

The goals, set by the initial action plan, are particularly important to be realistic and objective and to make their evaluation feasible and easy. The stages that the process of change evaluation goes through, and are analyzed below, are: the recording of the situation, control of implementation of the original design, and the future planning. Analytically:

➤ Record the situation

At this stage, all the data and indicators that will be analyzed are gathered, the way in which the evaluation will be done is defined and the time period in which it will take place, is determined. At this stage the quality, quantity and duration of the results are evaluated, as well as at the level of human resources - individual, team and organizational – and the possible reactions, related to the change, are examined and recorded. In cases, where there is a significant deviation, from expectations but also adherence to change processes and behaviors, then perhaps the revision of the change plan should be considered in order to intensify efforts (Χυτήρης, 2001).

➤ Application control of the original design

It is well known, that change plans, often have design problems associated with setting overly optimistic goals. At this stage, the evaluation focuses on verifying, whether the initial plan is achieved and whether the organization's resources are used effectively to achieve the goals of the change plan (Χυτήρης, 2001).

➤ Future planning

The evaluation, helps to determine the required future actions, based on the data / results from the implementation of the existing change plan. This helps to avoid mistakes in the future, as well as to identify and highlight the good practices, that have been successfully implemented, in the past. Therefore, at this stage the evaluation is the starting point for the redesign, where necessary, of the processes and operations of the organization. In this way, the future planning of the action plan goes through the evaluation of change with the ultimate goal of aligning with the vision of the organization (Χυτήρης, 2001).

3.7.1. Requirements for evaluating change

As mentioned earlier, the timing of change assessment is crucial for delivering reliable results. Early or delayed implementation of the assessment can lead to mistaken results (Huczynski & Buchanan, 2001). In addition, careful and organized evaluation, is necessary, especially in complex situations. Thus, for a proper evaluation, a plan must be created which will describe the purpose and goals of the evaluation, the measures and indicators for measuring the result, the sources of information and the ways of collecting the data, the methodology of analyzing the data and extracting conclusions. Finally, the

evaluation plan must describe the recipients of the final evaluation results and the time frame, in which the process will be completed (Huczynski & Buchanan, 2001).

In order to evaluate change, it is necessary to have goals that are clear, specific and measurable, but also a sufficient number of people, within the organization, should assess the results, in order to evaluate their involvement in the effort for change. Evaluation, as mentioned, is a complex and time-consuming process and therefore its implementation must be adequately funded. Finally, the evaluation should have as its ultimate goal the extraction of results, which aim at promoting the progress and improvement of the organization (Huczynski & Buchanan, 2001). Evaluating change, is a tool that helps the organization address significant challenges and problems. In particular, it helps management learn to handle and deal with any future changes that may occur. It also achieves the most efficient use of all available data / information, arising from the internal and external environment of the company, but also helps to integrate knowledge from past experiences. Finally, the evaluation of change helps to validly calculate the future performance of the organization (Huczynski & Buchanan, 2001).

4. OLD CULTURE

In the human capital of public administration, public power has been delegated and the responsibilities to exercise it have been delegated through regulations. In this sense, the civil service is part of the state power, belongs to the public sphere and operates according to the rules that govern it. As it is known, the Greek Public Administration is characterized by chronic problems and pathogens, which are based on the structural characteristics of the ruling bureaucratic administrative model, such as the strict hierarchical structure, the standardization of duties and responsibilities, the commitment to regulation, which were and still are, even today, the subject of intense controversy.

The result of such an administration is to develop a "civil service" mentality, which is characterized by inefficiency and alienation from its structural goal, which is to serve the citizen and businesses. Adherence to the exhaustively detailed rules that regulate, delimit and govern almost every aspect of organizational action, guarantees stability and predictability, the removal of uncertainties, the marginalization of deviations and arbitrary behavior and the rapid response to confrontation, especially known problems. The dedication of the action to the rule that regulates specific responsibilities and roles leads to, in theory, to the absolute depersonalization of the relations between the members of the organization. At the same time, predictability helps to create a sense of security in the external environment of the organization, which leads to a stagnation and devaluation of the organization itself and its fundamental goals. The executives, fortified behind a complex grid of formally defined responsibilities, roles, rights and obligations, do not gain a common understanding of the new situation, which they are called to face, nor an awareness of the connection of possible solutions-options with the mission of the organization. Instead, they "develop a particular type of bureaucratic personality", characterized by "secretive to fetishistic attachment to the process."

Their action is guided by the strict observance of the press, the avoidance of mistakes and not the conscious pursuit of success. They operate on the basis of "fragmented patterns of thought and action", which hinder learning processes and the reflection of functional rules and patterns. By adopting "defense routines", self-defense routines divert attention from the essence of the problems, shift or obscure responsibility and cultivate "a climate of extreme conservatism". Under these conditions, the vision and mission of the organization degrades and eventually loses its original meaning. The organization is unable to predict possible developments in the administrative field, to set precise and clear long-term goals and to define the stages, the means, the implementation schedule, as well as the methods of evaluating the effectiveness and efficiency of its action (Μαϊστρος, 2009).

In Greece, the ongoing devaluation of the body of civil servants, by both the media and the political system, makes it difficult to highlight the positive idiosyncrasies of the Greek civil servant, which can be the starting point for the reorganization of human capital, of the Greek public administration (European Union European Social Fund, "White Bible for Governance"). It is expected that the prevailing culture of the organization, will be an obstacle to those who try to impose some changes. Wherefore, the employees of the organization have made great efforts to adopt the culture that applies in the organization, they are opposed to make changes in this culture. An organization that wants to make

changes in its culture, should pay attention to the following (Θεοδωράτος, 2004): the form of leadership adopted by the organization, the structure and the history of the organization, the balance of power between different groups or individuals.

5. DIFFUSION OF THE NEW ORGANIZATIONAL CULTURE

During the first stages of planning and implementation of organizational change, organizational culture is researched and taken into account. The process of transition from the old to the new culture is laborious and long lasting, and requires strong leadership. The new culture, both in its entirety and in its individual elements, will be determined based on the general situation that prevails in the environment (internal or external) of the organization, the outlined strategy and policy followed by the company, some pre-existing elements of culture, that are characterized positively and finally based on the personal culture of the employees, mainly of the change leader and the senior management.

The following is a comparison of the current culture and the future desired, identifying the gap between them, as well as the required moves that need to be made to fill this. Based on the existing gap, the new elements of the new desired culture are formed. The elements of the new desired culture are the vision, the values, the principles, the beliefs, the convictions, the views, the way of acting, the attitudes. An important issue here is to identify (by the leader or leadership team), the new roles and values, as well as the new skills, practices and attitudes, that come from the new elements of the culture. The next and most important stage, after the identification of the new culture and the distribution of roles, are the actions and methods for the communication, dissemination and embracing of the new elements of the culture by the employees (Παπαλεξανδρή & Μπουραντάς, 2016).

In the best internal communication practices for the diffusion of the new corporate culture, dominate the frequent physical presence of the management, the meetings of executive teams at all hierarchical levels, the continuous training of the staff, the employee satisfaction surveys and perception of the prevailing culture and the utilization synergies and digital media (internal newsletter, intranet, management letters to all employees). Traditional media in combination with new media, are the best recipe for the successful promotion of the new image of the organization. Organizations have to project a human face and this is helped by Corporate Social Responsibility initiatives.

In all advertising activities, the message must be clear, communicated consistently and based on the truth. Advertising messages and slogans have no effect on sales, if they do not fully express the organization's processes and especially the "first line" service, that the customer will experience. The use of new media and social media is now essential, in order to reach a young audience. The great advantage of these, is the rapid dissemination of information while the threat is hidden in the fact that the organization ceases to have control over the information while it is acquired by the community. Therefore, at this stage the evaluation is the starting point for the redesign, where necessary, of the processes and procedures of the organization.

The determination, decisiveness, commitment and consistency of the management in designing the new identity and the new business plan, make it the orchestrator in the process of aligning and balancing different and often conflicting perceptions of the merging organizations. Success depends significantly on respect for employees' personalities, understanding of diversity, meritocratic and fair evaluation processes and the combination of different elements that will ultimately make up the new organization, the new unified and, above all, a commonly accepted, corporate culture. Commitment to the new work culture and the leader also play an important role in spreading the new culture. Important role in the diffusion of the new culture, play the commitment to the new work culture and the leader.

6. CREATING COMMITMENT TO A NEW ORGANIZATIONAL CULTURE

An extremely dedicated workforce, is 50% more productive than an indifferent and detached one. Employee commitment is a key driver of an alliance, between them and the organization that brings significant results to organizational success. Proper communication practice and the proper use of

change support mechanisms, create a new work culture, in which employees face new challenges. In these new challenges, they are willing to meet with dedication and zeal, and with different motivations beyond that of reward.

With the entry of new more specialized staff in the organization, the challenges for the existing staff become a reality. Commitment and productivity are increasing and the prospect of a new change is now essential. As already mentioned, loyalty is, to a large extent, the product of a strong leadership. Leaders who communicate effectively, provide constructive feedback, recognize and reward employee achievement, are able to create a strong culture of commitment. A crucial first step in leadership and guidance is to strengthen employee commitment and promote the motivation that leads to it.

Employees, very often, feel wronged and isolated from the central administration and the mission of the organization. That is why the leader, must create those conditions, in which new motivations will be created in the employee in order to contribute to the mission of change. These motivations may be the new technologies and skills required to use them, the range of responsibilities and their involvement in decision making. The leader must have the skills to contribute to the development and support of this new workforce, that you are creating. In addition, the leader has the ability to choose the right person for the right position. The result of such a process is to create a pool of manpower, with strong advantages and with an unparalleled commitment, to achieve the goals of the organization.

7. GOOD PRACTICES

At this point, case studies of organizations and companies, in the private and public sector, either in Greece or abroad, which have made significant changes, will be presented.

7.1. In Greece

The National Organization for the Provision of Health Services, is one of the few public organizations, which made significant changes with great benefits for it and for the insured. An electronic platform was created, the system of electronic prescribing and referral of diagnostic examinations, which had the effect of minimizing the inconvenience of the insured and the doctors. In this way, they have the ability to access and monitor daily the cost of the body for medications and tests. This change created many reactions, mainly from the employees of the organization (contracted doctors). The reasons were many and several. Some of the doctors did not know about computers, so this change was difficult for them. While some others reacted, because they thought that in this way, the organization questioned their credibility and aimed to control them. Another change, implemented by the organization, resulted in savings of public money and also of the insured, when they called to make an appointment with doctors. It removed the existing line for telephone appointments and replace it with others. According to the organization, the new telephone service (after an open tender) is provided by four contractors (e-value, Newsphone, Callcenter, BPO-Vodafone), instead of an option resulting in increased competition. The cost of the call, is charged only by the caller and is not distributed to all citizens through the state budget. As for the previous line, for telephone appointments, it costed 9 million euros per year, while the total annual cost of telephone service, borne by the insured, is estimated to exceed 1,500,000 euros.

Another recent example of a public organization that has implemented organizational changes is the General Secretariat of Information Systems (<http://www.gsis.gr/>), the so-called taxis net. These changes have contributed to the management and processing of tax data of employees, businesses and retirees. The necessity of implementing these changes was contributed by the general situation of the economy where the focus on the increase of tax revenues due to the debt crisis, increased the pressure for the intersection of data concerning the incomes of individuals and companies. The General Secretariat of Information Systems, responded to these pressures by linking the files of taxpayers with those of insurance companies and banks. Although this possibility was available through the technology that existed for the last ten years, the change had not been successful, due to various reactions that existed internally (employees) and externally (unions - institutions - politicians) from the General Secretariat of Information Systems.

7.2. In Abroad

MIT, the Massachusetts Institute of Technology, which is one of the world's leading universities, is known for its research, which has offered it, many Nobel Prizes and worldwide acclaim. The university, wanting to respond to the rapidly changing global, technological and educational environment, has created a free computer learning platform called MITx (<http://mitx.mit.edu/>). This is now considered a huge innovation in the global higher education market and has now been imitated by other top universities.

Apple is now the most valuable company in the world (more than \$ two trillion dollars). Apple has based its business model on the constant change of products and services it offers to its customers. The constant search for new technologies and the production of updated models from its successful devices (e.g., iPhone and iPad), are examples of effective change. Undoubtedly the impression of its customers, and not only, is that Apple is always at the forefront, with the products it introduces to the market and this basically refers to its ability to constantly change, even before it is demanded by customers or imposed by the competition.

The main reason for the implementation of Change Management practices by the BMW automaker was the initially high demand for the MINI (Watkins, 2003) at the beginning of the decade, which could not be met by the company's Oxford plant. For this reason, a group of specialized executives was invited, in order to improve the cooperation between the employees, in order to make them at the same time, more aware of the decision-making process in the company. Nine months after the team's intervention, the cost per car was reduced by more than 40%, thus making up for the subsequent low demand for the model. The main person in charge of the project was the Change Management and CIP manager of BMW Jeurgen Lubos, who in addition to coordinating the team of executives, which essentially functioned as coaches of employee's performance, also launched the Working in Groups (WINGS) program, which eventually boosted employee's morale and overall production at the Oxford plant.

The aim of the program was to create groups, in which each employee would exchange information and work experiences, and through them, ideas on improving production, would spring up. In this way, the real potentials of the employees came to the surface, essentially changing the way in which the latter think and cooperate as a team. A crucial component of WINGS 's success, was the fact that Jeurgen Lubos's coaches had the right to oversee co-operation between employees at all levels of the unit: from the manager to the last employee in the production chain. In the case of IBM CEO Samuel J. Palmisano (Hemp & Stewart, 2004), what was required was the collaboration of different parts of the company, in order to provide the company's customers with complete products (hardware, software, services, financial packages).

As a result, it asked 320,000 IBM employees in 17 different countries to connect to the company's internal network and discuss the company's new business values. The program was called "Values - Jam" and ran for 72 hours in July 2003 on the IBM intranet. Its results, were considered very positive and defined the new values of the company (Loyalty to the success of each customer - Innovation important for the business and society - Trust and personal responsibility in all relationships) with the consent of employees, while at the same time Palmisano gave flesh and blood to the effort to re-establish the business, directing it to the provision of integrated services.

7.3. Changes Recorded to Organizations of OECD Countries

OECD countries face a growing number of challenges posed by globalization, decentralization and diversification of governance. Societies expect more than one government, in areas such as education, health, safety, environmental protection, among others. The role of government has changed dramatically, as it has become part of a larger policy network, in which it has a role to play and participates in decision-making. Public service reform aims to improve human resource management, make better use of public resources, provide better public services and change the public service image as an employer.

Economic constraints, growing social demands, and increasing international dependence make reforms necessary if a government is to respond effectively to these challenges. The purpose of this section, is to examine the experience of the six OECD countries - Finland, France, Italy, Portugal, Spain and Switzerland - in managing the change brought about by the implementation of public administration reforms. In this sense, this section will present an overview of reform initiatives. It will highlight some of the factors that have led to civil service reform in these countries. Next, we will analyze how these OECD countries managed change based on the idea of receptivity.

7.3.1. The Experience of These Countries - An Overview

The design and achievement of the goals of the reform initiatives in these six OECD countries, are largely based on their own political, historical, social and economic conditions. Finland, France, Italy, Portugal, Spain and Switzerland have undergone significant changes in their administrative culture, as the procedures and the way they carry out their institutional arrangements conflict with national needs and priorities. The traditional work culture of their staff has proven to be less adaptable to new national and international challenges.

However, introducing change in the public service is in itself a challenge, as reform initiatives are generally resisted by civil servants and other members of society, who remain skeptical about their effectiveness and benefits. The planning and objectives of the reform initiative are based significantly on the general historical, social, political and economic context of these countries. However, it is worth noting that, despite their different backgrounds, reform programs generally show a willingness to improve the efficiency of public services to meet society's growing expectations, while reducing financial resources and political pressure. The Finnish Finwin program seeks to address deficiencies in leadership and public service communication. The success of the program depends almost entirely on its positive impact on change initiatives, such as regionalization programs and productivity.

The Finnish experience in trying to change the public administration shows the dangers of a lack of communication strategy and dedicated leadership. Policy making and planning a communication strategy are two closely linked processes required to make the change. However, it should be based on dialogue between all stakeholders and leadership. France has recently launched the Organic Law on Finance Law (LOLF), which establishes a new fiscal logic. LOLF aims to transform an old culture into a results-oriented (culture). The gradual implementation of LOLF, allowed the adaptation of the old culture to the new before its full implementation. Political support, dedicated leadership, a gradual implementation process, a communication strategy, training, and testing are the factors used by the French authorities to implement the change process brought about by the implementation of LOLF. The reforms carried out in our Italian public service show that the change in public administration is a long process that requires, among other things, political commitment, the ability to learn from the experiences of others, and a self-critical approach.

The implementation of the reforms, inspired by the principles of management, is expected to change the culture of the public service. Today, the Italian public administration is facing the challenge of consolidating the structural reforms that began ten years ago. To do this, the Italian authorities have adopted a self-critical approach to assessing their strengths and weaknesses, and in addition are drawing lessons from peers to improve their own reform process.

Portugal has recently begun the process of renewing and modernizing its public administration. Five reform programs were designed to introduce a new public sector culture, but implementation has been gradual, with only two of these reforms in place. The success of these reform measures depends on the successful change of mentality of the people. On the one hand, although the opinion of civil servants on these reforms is not favorable, on the other hand, the media and economic agents consider this change necessary in order to achieve economic growth. The Portuguese experience in managing change in the public sector shows the ease of a gradual reform and the need to maintain a steady pace in order to achieve the desired results.

Spain has recently implemented a general regulatory framework for civil servants at all levels of government. The Civil Servants Basic Law (EBEP) aims to provide coherence to different human resource

management practices in public administration. This new legislative framework is a radical shift from traditional management culture to the introduction of new public sector-oriented management practices. The Basic Law on Civil Servants (BLCS) aims to provide coherence to the various human resource management practices in public administration. This new legislative framework is a radical shift from traditional management culture to the introduction of new public sector-oriented management practices. The Spanish experience introduces the epitome of establishing dialogue and consultation with all stakeholders.

Contributes to the process of formulating a policy that can manage change more effectively. Consultations and dialogue enable the creation of a common vision, supported by the majority of political and social forces. Economic pressures, rigid and costly procedures, and declining labor market competitiveness have led the Swiss government to new reforms, including in its human resource management system. Two cross-cutting plans aim to optimize staff management, and simplify the legal framework and are expected to change the image of the public service from 2015. The Swiss experience reflects the need to create the vision of change. Frequent consultations and dialogue aim to create a common vision, which will be supported by the majority of the political world and all social forces.

7.3.2. Comparative Experience Analysis - Change Management in the countries implemented

The experiences of the six OECD countries differ in scope, timetable and cover various areas of administrative reform: such as, human resource management (HRM), budget issues, and leadership. However, using the concept of receptivity, it is possible to distinguish some common and some divergent views on the practice of change management in OECD countries.

The ideological vision refers to the existence of a strategic plan, defined according to the interests of a specific group within the organization, and provides solutions to a perceived problem and the culture of the organization. Indeed, case studies reveal that the creation of a common vision is of the utmost importance in order to give direction to the reform efforts. This was the case of Switzerland, France and Finland, where reforms are backed by a vision for the better and the desired situation. This vision must be shared by all members of the leadership team or leaders and must convey it to all stakeholders and actors affected by the proposed reforms. When the vision is absent, then the reform efforts turn into irreconcilable projects and confusion. As Liuksia places it: "a common vision tells us where we are going, what we want and where we will be in ten years."

The French LOLF is based on a vision for managing public finances in a more transparent and flexible way. LOLF supporters are also seen as its visionaries, who were able to create the need for change and explain the dangers of maintaining the status quo. The Swiss authorities have created a vision of the public service since 2015 and now any reform effort must point in that direction. Finland builds a vision of public service through discussions that took place during the seminars that are part of the Finwin program. The dialogue between managers allows the Finnish authorities to set out a general picture of the public service for the future.

The experience of Finland, France, Portugal and Switzerland reveals the need to disseminate the vision and exchange information with all possible actors involved or affected by the transformation process. Finland, for example, has struggled to implement regionalization and productivity programs because it has failed to consolidate and communicate the need and vision for this change. The cases of France, Italy, Portugal, Spain and Switzerland seek to establish or introduce public service management practices, which are expected to improve service delivery and make better use of human and financial resources.

Leaders of change

This factor of analysis, identifies decisions and analyzes the actions of leaders. Evidence presented in case studies shows that decision making is in politics and senior management. The consultation procedures, as in the case of Spain, are intended to justify or legitimize a decision that has already been taken. Reforms may undergo some modifications in their technical aspects, but the recognition of the problem, the need for reform, the approach to the solution, and the timing of their implementation are decided by the members of the political and management elites. The Treasury Department's leadership

role in the reforms analyzed reinforces the claim that administrative reforms are among the broader policy objectives. For example, the issues of Human Resource Management that are related to financial and economic policy are defined by the Ministry of Finance. Therefore, the Ministry plays a dominant role in the reform process. This is something beneficial, however, it runs the risk that administrative reform can be defined in terms of economic priorities rather than the real needs of public administration, which will make it more efficient and effective. The question that arises, here, is whether financial leaders are ready to lead change. There is no doubt that they are technically trained to implement a sophisticated reform proposal, such as the French LOLF, but whether they are willing to deal with the change produced by the reform is a different issue.

The fact that Finnish regionalization and productivity programs are difficult to implement was not due to a lack of technical knowledge, but to limited leadership skills and a lack of change management strategy. One possible explanation may be their educational profile, as they may not have been trained to be organizational leaders, but their training may have focused on technical issues, rather than how to manage the impact of their decisions. Finland, France, Spain and Switzerland need to look at executive leadership development as a key factor in mitigating difficulties on the road to change. This has a double meaning. First, it means that it does not matter how competent or dedicated civil servants are, because without a dedicated and credible leadership, reform efforts can prove unavailing. And second, managers must be able to act as leaders. Leaders are not just individuals, who take these positions, but the rest of the team also play an important role. It is the groups, that act as advocates for the need for reform, they create a vision, which they convey to all stakeholders, and thus gain and maintain social and political support. This claim has been proven by the six case studies.

Institutional policy

This factor aims to explain the importance of cooperative organizational networks. Indeed, dialogue, political support and social involvement in policy-making have proved important in creating the ownership and legitimacy of reform proposals. This suggests that the public service is closely linked to the expectations, pressures and unpredictability of the political world. In the six countries analyzed, decision making is at the top of the organizational hierarchy. This factor reflects the prevalence of a top-down approach in the policy-making process, where the political and management elites play a dominant role in the decision-making process.

Implementation ability - Training

This factor refers to the mechanisms used by leaders to shape and influence policy implementation and stakeholder behavior. Evidence from case studies shows that training of managers has been a widely used tool for managing change. In general, the training had two objectives: to explain the policy reform initiative and its technical details, and to encourage horizontal and vertical dialogue between managers. Some of the reform programs are extremely complex, and administrators, will need to be trained before and during the implementation of the initiative. The training courses also allow for dialogue and exchange of experiences between administrators, as in the case of Finland and France. Training courses are a forum for discussion, from which lessons can be learned to improve the reform initiative. One of the added values of training is that they allow to explain the necessity for change, in more detail, to people who are responsible for running the program. In Finland, the Finwin program, in addition to being a forum for the exchange of experiences, has the task of producing a sense of urgency for reform among managers at different administrative levels.

8. SUGGESTIONS

The comparative analysis of the experiences of the six OECD countries from their public sector reform effort, and the data provided by the bibliography review, led to suggestions. The OECD document proposes that a reform / change, in particular an administrative reform / change, should have the following characteristics in order to be manageable and more effective in achieving its objectives:

- It should be simple.

A reform proposal may not reflect the full complexity of public service. Reform proposals should reflect the principles or ideas of an improved situation, therefore detailed information on technical issues, should be avoided. When reform proposals are too complex, they are likely to generate misunderstandings and resistance.

- It should be consistent.

This means that reform must rely on an undivided sum of values and principles (Brunsson, 2006). This is particularly important as reform proposals tend to change the foundations of an organization's traditional culture. The messages that are transmitted, about the upcoming change, should focus on the solutions that will be given to the particular problems and pathogens that prevail so far in the organization. In addition, it is not possible or convenient for the organization, to proceed to several reforms, at the same time.

- It should be based on evidence.

Reform, should provide convincing arguments about a problem, now or in the future, and its solution. One way to do this is by drawing lessons from the experiences of others, both internal and external. This requires them to be involved in a process of education and training. However, it should be considered that successful experiences and settings, may not produce the same results, in other applications. The search for evidence must cover cases of success and failure, as it is possible to draw lessons from negative experiences, and examine cultural differences between countries.

- It should be realistic.

In general, reforms are based on a theoretical framework, in terms of their objectives and what can actually be achieved in a specific context and time frame. Reforms must be politically and technically viable. Thus, policymakers and decision-makers should ask themselves what can really be achieved, and in what time frame, taking into account the advantages and limitations of the reform proposal. This is vital, so that they do not lose support for reform by creating false expectations.

- It should consider a course of action, to address potential side effects.

Reforms are, to some extent, a gamble because they carry risks and can have side effects. A reform aspect of the administrative structure may have implications for other aspects. Performance appraisal, for example, can serve as a tool to increase efficiency in public administration, but it can create a patronage system, if appropriate measures are not taken to avoid it. Indeed, reforms have limitations and certainly cannot solve everything, and subsequently, reforms can lead to more reforms.

- Stare at the future.

The reform of public bodies is a long process and its results cannot be immediate. Perseverance and patience are key characteristics for a leader, because reforms must take place and changes must be achieved. This is due to the fact that reforms promise future benefits that are often visible in an even longer period of time (Brunsson, 2006). These features can also facilitate reform management and change management. This is because a reform that is simple, consistent, evidence-based, realistic, and proposes solutions to a long-term approach is relatively easy to explain and understand. These elements could be considered as common sense, which can distinguish a manageable reform from an unmanageable one, and can be used as a basis for defining the reform, thus reducing the levels of risk.

9. CONCLUSION

At this stage, it can be argued that change has been incorporated into budget processes, but it still needs more time to be fully integrated into the public service culture and people's minds. The conclusions that emerge for the management of change, may be summarized as follows:

- ✓ The necessity to create a vision and develop a strategy to achieve it.
- ✓ The need for political support, and the formation of a leadership coalition, which will lead the change effort.

- ✓ The need for a strong and dedicated leadership, with enough moral and legal authority to encourage coalition members to work together as a team.
- ✓ The ease of gradual implementation of the reform, as it facilitates the understanding, adaptation and creation of a sense of belonging.
- ✓ It takes a long time for people's "minds" to adapt to a new environment.
- ✓ The usage of different channels of communication, which will explain the reform and will share information, for example: the media, conferences, shapers of public and internet opinion.
- ✓ The use of education, as a tool to remove obstacles for reform. Thus, it will be able to develop the goals of the reform, in a more detailed way.
- ✓ The ease of controlling the initiative, which will encourage the creation of a learning system, through experiences, to improve the reform initiative.

Change in organizations, private and public, is not a simple and easy task. No one can guarantee its success with certainty. However, as we analyzed, there are mechanisms to support change that if the organization adopts them and imports them by applying appropriate methods and techniques, will achieve the desired change. Living in a constantly changing environment, organizations cannot but accept change, as an integral part of their culture. Even the survival of an organization, is judged, nowadays, by its ability to accept and implement change. The leader and the workforce of the organization, are the most important carriers of change. Aware of the importance of commitment to the idea and values of organizational change, employees have to accept that change is a necessary condition for the organization, which desires to continue to exist and create.

Introduction

According to Aristotle, man is not only a "political animal"¹, but also an "economic". Particular scientific disciplines investigate these two basic properties. "Politics" deal with the status of man as a political animal². The science that refers to the economic life of man has as special objects the "possessive" and mainly the "economic". The first includes the phenomena related to the finding of the necessities of life. The second, the phenomena that result from the use in the individual economies of the goods offered by the property.

1.Finance theory in Aristotle

Possession seems to be contrasted by Aristotle³ in "simple possessive" to "financial possessive". The simple possessions belong to the productive branches, with which man acquires economic goods directly from nature, while financial corresponds to an advanced economic situation, in which the acquisition is mediated through trade, credit and especially money (Kraut, 2005).

Particularly: Simple possessiveness presupposes underdeveloped economic conditions and corresponds to the so-called "natural economy". In it, Aristotle distinguishes various economic "lives": the "nomadic", the "fishing" and the "agricultural". Not every financial life is really clearly and completely separate from the others. That is, it is not only nomadic but complex, nomadic, agricultural and fishery, etc. According to Aristotle, possessiveness is based on absolutely moral foundations without presenting anything inherent. It is "possessive in nature".

In more than one point in "Politics" the normality of its operation is excluded. "Possessive by nature" is characterized as "warlike", which, among other things, promotes the living organs of production, the slaves. By nature, he also considers financial goods by direct exchange and if the latter is done to replace self-sufficiency by nature (Goodman, 2007). Aristotle considers true wealth only that which arises directly from nature or after direct exchange.

1 Barker, op. cit., pp. 354-5. "Politics' in the Greek is an adjectival form – as if we should say 'the political'. What is the noun which it implies? Strictly, it is the noun 'science' (episteme). But sciences may be, in Aristotle's view, practical as well as theoretical, and since the science of politics is largely practical, we may say that 'the political' implies the noun 'art' or 'capacity' (techne or dynamis) no less than it implies the noun 'science'. In a word, it implies both. 'Politics' is the scientific study of the polis, and of all things political, with a view to political action or the proper exercise of the political 'art'."

2 Politics I, 2, 1094b 4-6 "ordains which of the sciences should be studied in a state (...) and we see even the most highly esteemed of capacities fall under this, e.g., strategy, economics, rhetoric; now since politics uses the rest of the sciences, and since, again, it legislates as to what we are to do and what we are to abstain from, the end of this science must include those of the others, so that this end must be the good for man."

³ Aristotle, Politics, B 7, 1266b 29-31, 1267b 3-8.

Financial presupposes an expansion of the debt cycle of individuals and generally advanced economic conditions, which corresponds to the so-called "transactional" or "monetary economy". Finance is not like simple possessiveness by nature⁴ ("out of nature"), except for some exceptional cases of "intimate finance". This is unnatural, because it is insatiable: it leads to greed and seeks unlimited wealth. In that category is trade, money and faith, as well as "misharnia", that is, the hiring of physical human labor, as well as the hiring of mental and spiritual services, such as the warrior, the teacher, etc. The latter is particularly reprehensible. Wealth acquired through finance is artificial wealth, wealth rather than nature and therefore despised.

2. About money.

Aristotle also tolerates money, as well as trade, when used solely to facilitate transactions (Goodman, 2007). Otherwise, money is to be despised when it is diverted from its destination and in particular when it facilitates speculation and greed. Aristotle deals with great interest and to a great extent in "Politics" about the origin of money and the economic need that gradually imposed it on the various societies. In trade, he says, an equation between unequal things must be sought and the means to that end is money (Kraut, 2005). Without it, neither exchange nor society is possible. Also, the evolution of money into currency is extensively mentioned, ie the money that the state introduces as a mandatory means of payment. This is related to the need to verify the amount of precious metal contained in the money.

Particularly: Aristotle seems to have knowledge of the various properties of money and in particular of the property of the common medium of exchange, the common measure of values and in a way the means of representation and preservation of values. According to Aristotle, money puts aside the difficulties of exchange due to the economic inequality of the species exchanged. Money is a product of a social condition. It does not work by nature, but by law, by agreement or custom. That is why it is called a currency. Aristotle has a clear understanding of the above properties of money. Nevertheless, he says that money itself has no value, but is a mere illusion. Therefore, it can be declared completely useless by the law that enacted it. In this way, money, and especially metal, would be turned into a simple symbol. So, if the property of money as a spare medium is removed, money has no value. Aristotle contributed greatly to the clarification of the concept of money and was the first to clearly articulate the concept of wealth and distinguish it from the concept of money.

Now, after a period of total separation between ethics and economics, the relationship has been restored giving relevance to the interconnections of economics with other aspects of life (Goodman, 2007). Such a position is in favour of Aristotle's ethical economic thought, whose relationship with other values is in tune with recent economic developments. Aristotle certainly expressed concepts and reflections which later developed in many directions; The world of the Greek *polis*⁵ is one of the best instruments to understand the relationship between ethical, political and economic matters in the ancient world.

Conclusion

According to Aristotle, wealth is not allowed to be the purpose of human actions, but only the means to an end, which is the "good life", the good life. There is a limit to every art as far as the number of

4 Politics I, 9, 1258a 6-14, "each and every capacity in a way non consonant with its nature. The proper function of courage, for example, is not to produce money but to give confidence. The same is true of military and medical ability: neither has the function of producing money: the one has the function of producing victory, and the other that of producing health. But those of whom we are speaking turn all such capacities into forms of the art of acquisition, as though to make money were the one aim and everything else must contribute to that aim."

5 "It is clear, therefore, that a polis is not an association for residence on a common site, or for the sake of preventing mutual injustice and easing exchange. These are indeed conditions which must be present before a polis can exist; but the existence of all these conditions is not enough, in itself, to constitute a polis. What constitutes a polis is an association of households and clans in a good life (eû zên), for the sake of attaining a perfect and self-sufficing existence (autárkous)."

instruments is concerned for its exercise, so there must be a limit to the number of instruments for the exercise of the good life, which likens it to art. Given that the organs are the goods that consist wealth, it follows that wealth must have a limit.

²Moldova State University, PhD, Associate Professor

Abstract: Distribution logistics management is nowadays, in the conditions of a competitive market, a major strategic stake for industrial and commercial enterprises. This represents an important potential for creating value for customer: quality of service, performance in terms of time and reactivity. It is also one of the main places where part of the entity's profitability is disputed, through rationalizing supply chain costs or by focusing on new distribution channels.

The research presented in this paper generalizes the theoretical and practical results on the conducted study, that reveals some deductions and measures, which, in our opinion, will contribute to improving the supply-delivery chain and the use of tools to measure market phenomena within the distribution of agrifood products on the market of the Republic of Moldova.

Key-words: logistics, marketing, agrifood, distribution network, profitability of entity, efficiency of distribution network.

Introduction

The importance of logistics in the development of marketing research through the use of scales and methods is motivated by the role they play in marketing, especially in contemporary marketing of the agro-food field. It is well known that for a successful entrepreneurship you need to know your customer and the research scales are objective, comprehensive and easy to interpret methods that allow entities to outline the customer's profile, consumer preferences, attitude towards the entity and the competitors. The market economy contributes to the growth of the gross domestic product, based on the law of supply and demand, while the supply of enterprises with material resources cannot always be analyzed, as well as the factors of production. An analysis of the companies' costs of production highlights the importance of supplies for economic entities. It can be easily concluded that the most significant share in total sales of goods have the costs for supply. According to studies conducted by supply specialists, they can reach up to about 68% of total sales of goods.

Materials and methods

The study analyzes the efficiency of the agri-food supply channels in the Republic of Moldova. The presented data are based on the concrete aspects taken from official sources placed on the website of the National Bureau of Statistics, based on which are analyzed in dynamics (2015-2020) the import-export volumes of agri-food products from the Republic of Moldova. To determine the economic efficiency of this area, were used the methods of analysis and synthesis, of comparison, statistical method. This topic is approached by many researchers from abroad (Olsen, P., Borit, M. (2012), Scharff, R. L. (2012), Zhang, M., Li, P. (2017)).

Results and discussions

Distribution logistics exceeds the difference in space and time between the production and consumption of goods. According to the functions performed by the different categories of participants, there are two components of the distribution:

1. the procurement system;
2. the physical distribution system, respectively the distribution logistics.

The procurement system of the distribution means the monitoring of the distribution channels, respectively the structure of the legal, economic, informational and social relations between the members of the goods transfer systems. This system refers to the part of the sales which is based on the chain formed by the own sales compartments of the manufacturing company and the distribution intermediaries that intervene in the way of the producers towards the final buyer. In the center of this system is the transfer of ownership over the respective goods (distribution transaction function).

According to Reina U.M.L, (2012), the physical distribution system, respectively the distribution logistics, is oriented to agree the space and the time that separates the consumption production, through transport and storage. In addition to these two functions, there are also orders and their delivery.

A completely separated approach of the two systems presented above is not justified, given that procurement and logistics activities have a lot of contact points, they are only taken over in some cases by different distribution compartments. The efficiency of the entire distribution system can be enhanced when both areas of decision-making are considered simultaneously.

Distribution logistics is the set of means and operations that ensure the provision of goods and services to users or final consumers by manufacturing companies.

Distribution logistics aims to meet the needs of the demand created by marketers using minimal costs.

In view of the above terms, distribution logistics fulfills the following functions:

- determining market demand and organizing its satisfaction in a rational way;
- accumulation, sorting and optimized distribution of stocks of finished products;
- establishing the economic relations of continuous distribution of products and services;
- selection of rational forms, from a financial point of view, of organizing distribution networks.

Thus, the basic functions of distribution logistics refer to the planning, analysis, control and management of sales of products and services through distribution networks.

In a logistical channel, independent or dependent institutional components have common tasks, determined in a successive order. However, certain individual guidelines, legislative restrictions and some liability issues still lead to conflicts within the distribution channel, in particular the problem of coordination in a complex network of production and information flows. Agreements must be prepared between the institutional components of the distribution channel, for the cooperation, coordination and control of the service of companies (distribution intermediaries and auxiliaries), taking into account the mutual dependence of decisions on the form of logistics activity of distribution. Thereby, for example, small stocks in some cases lead to higher transport costs, or the requirement to reduce the risk of product damage leads to increased packaging costs.

The interaction of the elements of the distribution logistics is important, because each component of the distribution logistics does not necessarily need to be optimally structured, in order to receive the synergistic effect of the activity of all the components of the logistics chain.

Distribution is a major component of the marketing mix, which, in a unitary form, defines the process of bringing goods and services from producer to consumer. Most experts acknowledge that distribution cannot be limited to a simple circulation of products, so distribution is a much more complex process that begins when the product is ready to be launched on the market and ends with the consumption of the act. for sale to the final consumer. During this period (time and space), several logistical operations are carried out, along with many other specific activities of a financial and marketing nature, with the aim of satisfying, in conditions of maximum efficiency, the needs of consumers and / or users. Distribution refers both to the physical and economic circuit of goods, and to the system of relations between market agents, to the activities of a wide and heterogeneous mass of units belonging to several economic areas.

The increase in exports of agri-food production has a positive impact on consumption and income in the medium and long term, while also serving as a major stimulus to the non-agricultural economy in rural areas. However, the increase in exports depends on the ability of the Republic of Moldova to exploit its

comparative advantages and the ability to engage in the international trading system. A major barrier to trade of agri-food products are the underdeveloped and dispersed agricultural markets, which are a key factor in reducing incomes of agricultural producers. Local prices for agricultural producers are much lower than international prices, which affects the profitability of agriculture, which is currently lower compared to other sectors of the economy. The insufficiency of the own financial resources of many agricultural producers is caused by the reduced competitiveness of their production both on the internal and on the external market.

The low capacity of modernization of processing enterprises also has a negative influence. Most manufactures have outdated equipment and produce production that does not always meet the requirements of the European market. This situation creates conditions for underdevelopment: the quality of products decreases, which leads to low selling prices and limited market opportunities. At the same time, low sales revenues create obstacles for the process of modernization and, respectively, improving product quality.

The financial condition of most processing enterprises does not allow them to permanently credit agricultural enterprises on base of the next harvest. The country lacks vertically integrated systems, which bring together agricultural producers and processors of agricultural products. Agricultural entrepreneurs, in many cases, do not have information on standards, buyers, prices, etc. This situation creates an atmosphere of mistrust between producers and buyers. Paradoxically, the safest markets for farmers are low-value crop markets, such as cereals, corn, sunflowers. These crops, as a rule, do not require large investments. Relatively stable markets, traditional knowledge of cultivation techniques and low investment cost lead many farmers in the country to continue to grow these crops. The export of the mentioned agricultural products or of the products obtained by their processing does not bring considerable income to the producers. In this situation, the export potential can only be exploited by increasing the cultivated areas, obtaining significant quantities of one or more of the products in which the respective enterprises specialize.

Fig. 1. Monthly evolution of value indices of exports of goods in the years 2019-2020 (%)

The National Bureau of Statistics informs that the exports of goods made in December 2020 had a value of 218.3 million US dollars, 16.7% lower compared to November 2020 and similar to that recorded in December 2019 (Fig.1.).

In 2020, exports of goods amounted to 2485.2 million US dollars (Figure 16), their value being 10.6% lower than in 2019.

Fig. 2. Evolution of value indices of exports of goods in the years 2000-2020.

The exports of local goods in 2020 amounted to 1905.2 million US dollars (76.7% of total exports), decreasing by 4.6% compared to 2019, thus influencing the decrease in the total value of exports by 3.3% (Fig. 2.).

Re-exports of foreign goods (after processing and classic) in 2020 amounted to 580.0 million US dollars (23.3% of total exports), or 25.8% less compared to 2019. This decrease contributed to the decrease in total exports by 7.3% (Tab.1).

Table 1. Evolution of trade in agri-food products in 2020.

The analyzed categories	Year 2020		Structure, %		The degree of influence of groups of goods on the increase (+), decrease (-) of exports, %	
	Thousand USD	in % compared to 2019	2019	2020	2019	2020
					2019	2020
EXPORT - total	2 485 159,94	89,42	100,00	100,00	2,70	-10,58
from which:						
Food products and live animals	525 921,19	82,59	22,91	21,16	0,88	-3,99
Oils, fats and waxes of animal or vegetable origin	103 447,72	147,84	2,52	4,16	0,12	1,20
IMPORT – total	5 415 671,45	92,69	100,00	100,00	1,43	-7,31
from which:						
Food products and live animals	658 539,04	107,86	10,45	12,16	0,85	0,82
Oils, fats and waxes of animal or vegetable origin	12 094,65	107,13	0,19	0,22	-0,01	0,01
COMMERCIAL BALANCE			2019	2020	2020 in % compared to 2019	
total, thousands USD			-3 063 319,87	-2 930 511,51	95,66	
from which:						
Food products and live animals			-132 617,85	-133 710,13	99,15	
Oils, fats and waxes of animal or vegetable origin			26 190,88	-132 617,85	x	

As an example for the analysis of the agri-food distribution market we propose the analysis of the sales market for each subsidiary of the METRO store, for which data are presented based on the

achievements in the previous year 2019 - "0" and the actual achievements marked with "1". We will perform market segmentation on three types of consumers:

Consumer I- final consumer;

Consumer II- reseller;

Consumer III- HoReCa.

Following the calculation of this issue, we aim to quantify the importance of each consumer category in the total sales of METRO Moldova.

Table 2: Data for sales in the Metro 1 store

Market segment	Sales METRO 1 (thousand lei)		Total sales METRO (thousand lei)		Distribution share by consumer category		Sales structure		Recalculated share
	0	1	0	1	0	1	0	1	
Consumer I	300000	375000	928000	934000	32,328	40,150	35,352	34,427	11,129
Consumer II	250000	290000	898000	919000	27,840	31,556	34,210	33,874	9,430
Consumer III	260000	265000	799000	860000	32,541	30,814	30,438	31,699	10,315
Total:	810000	930000	2625000	2713000	30,903	34,279	100,000	100,000	30,875

Calculation formulas:

$C_{Dc} = \frac{V_{pi0}}{V_{i0}} \times 100$ - calculating the data in the table presented below through this formula, we will find out the share of sales distributed by consumer category in the previous year.

$C_{Dc} = \frac{V_{pi1}}{V_{i1}} \times 100$ - calculating the data in the table below through this formula, we will find the share of sales distributed by consumer category in the actual year.

$g_i = \frac{V_i}{\sum_{i=1}^n V_i} \times 100\%$ - through this formula and the data presented in the following tables we will find out the sales structure by consumer category in the total sales for the METRO company.

$C_{rDc} = \frac{g_{i1} \times C_{pi0}}{100}$ - this formula allows us to recalculate the share by category of consumer in the actual year compared to the previous year.

Applying the factorial analysis to the sales market carried out under Metro 1:

$$C_{Dc} = \frac{V_{pi0}}{V_{i0}} \times 100 = \frac{300000}{928000} \times 100 = 32,328;$$

$$C_{Dc} = \frac{V_{pi1}}{V_{i1}} \times 100 = \frac{375000}{934000} \times 100 = 40,150;$$

$$g_i = \frac{V_i}{\sum_{i=1}^n V_i} \times 100 = \frac{34,427}{2625000} \times 100 = 35,352;$$

$$C_{rDc} = \frac{g_{i1} \times C_{pi0}}{100} = \frac{34,427 \times 32,328}{100} = 11,129;$$

$$\sum_{C_{pi}} Cdc = \frac{11,129 + 9,430 + 10,315}{3} = 30,875$$

Table 3. Data for sales recorded in the Metro 2 store

Market segment Consumer category	Sales METRO 2 (thousand USD)		Total sales METRO (thousand USD)		Distribution share by consumer category		Sales structure		Recalculated share
	0	1	0	1	0	1	0	1	
Consumer I	32500 0	36000 0	928000	934000	35,02 2	38,54 4	35,352	34,427	12,057
Consumer II	29000 0	31000 0	898000	919000	32,29 4	33,73 2	34,210	33,874	10,939
Consumer III	30100 0	31500 0	799000	860000	37,67 2	36,62 8	30,438	31,699	11,942
Total:	91600 0	98500 0	262500 0	271300 0	34,99 6	36,30 7	100,00 0	100,00 0	34,938

From the analysis of the data from the exposed tables we notice that for Metro 1 the achievements on sales exceeded the values provided by 120 thousand USD.

$$\Delta V_p = V_{p1} - V_{p0} = 930000 - 810000 = 120000;$$

For Metro 2, sales exceeded the forecast values by 69 thousand USD:

$$\Delta V_p = V_{p1} - V_{p0} = 985000 - 916000 = 69000;$$

For Metro 3, sales exceeded by 32 thousand USD

$$\Delta V_p = V_{p1} - V_{p0} = 771000 - 739000 = 32000.$$

Table 4. Data for sales recorded in the Metro store 3.

Market segment Consumer category	Sales METRO 3 (thousand USD)		Total sales METRO (thousand USD)		Distribution share by consumer category		Sales structure		Recalculated share
	0	1	0	1	0	1	0	1	
Consumer I	26900 0	27300 0	928000	934000	28,98 7	29,22 9	35,352	34,427	9,979
Consumer II	25000 0	26000 0	898000	919000	27,84 0	28,29 2	34,210	33,874	9,430
Consumer III	22000 0	23800 0	799000	860000	27,53 4	27,67 4	30,438	31,699	8,728
Total:	73900 0	77100 0	262500 0	271300 0	28,12 0	28,41 9	100,00 0	100,00 0	28,138

According to the data presented in the tables we can perform a deeper factorial analysis based on the following criteria:

The influence of sales distributed in stores on the total sales recorded by the company.

$$\Delta V_p = [V_1 - V_0] \times \frac{C_{p0}}{100} = [2713000 - 2625000] \times \frac{30,903}{100} = 88000 \times 0,309 = 27194,64 \text{ th.m.u.}$$

The exceeding by 221000 thousand m. u. of the sales on stores than the ones actually realized, on the one hand, was caused by the increase of the total sales by 88000 m.u., and on the other hand it was influenced by the modification of the company's sales volume by increasing them by 27194.64 thousand m.u.

The influence of the structure by consumer categories on the company's sales.

$$\Delta V_p(g_i) = \sum_{i=1}^n \left[\frac{\sum C_{rdc1} C}{100} - \frac{\sum C_{rd0} C}{100} \right] = 2713000 \left(\frac{31,317}{100} - \frac{31,340}{100} \right) = -623,99 \text{ th. m. u.}$$

Unfortunately, the positive influence from criterion 1 was annihilated due to the distribution of sales across the three consumer categories, different each year and per store. The company expects to increase turnover in the HoReCa category and resellers.

The influence of the market shares of each store.

Metro 1.

$$\Delta V_p(C_{pi}) = \sum_{i=1}^n V_{p1} - \sum_{i=1}^n V_{i1} \times \frac{\sum_{i=1}^n C_{rpi}}{100} = 930000 - 2713000 \times \frac{30,875}{100} = 550501,25 \text{ th. m. u.}$$

Metro 2.

$$\Delta V_p(C_{pi}) = \sum_{i=1}^n V_{p1} - \sum_{i=1}^n V_{i1} \times \frac{\sum_{i=1}^n C_{rpi}}{100} = 985000 - 2713000 \times \frac{34,838}{100} = 602000,64 \text{ th. m. u.}$$

Metro 3.

$$\Delta V_p(C_{pi}) = \sum_{i=1}^n V_{p1} - \sum_{i=1}^n V_{i1} \times \frac{\sum_{i=1}^n C_{rpi}}{100} = 771000 - 2713000 \times \frac{28,138}{100} = 546439,96 \text{ th. m. u.}$$

Thereby, the negative influence in point 2 was offset by the positive influence determined by the market share of each store.

Following the calculations performed, we reach the following conclusion: METRO Moldova still has to work hard on covering with products as needed and advantageous prices for each category of consumers. Being a company with a policy that is mainly based on HoReCa customers and resellers, METRO should invest more in attracting these types of customers, which is very difficult to maintain due to fierce competition, but also other external factors created. state and business environment in the Republic of Moldova. The promotion, distribution and pricing policy allows it to maintain its current market share and also tries to expand on each customer segment.

Conclusions:

Both market dynamics and high consumer demands on product quality and availability have profoundly influenced the way the current economy operates. Those requirements have contributed to the evolution of the supply process concept from pro-active operation, which focuses on a forecast of demand and standard material flow, to reactive operation. In such a way, the sub-compartments involved in the supply chain distribute real-time information to increase the visibility of demand and reduce inventory.

The implementation of the supply-delivery chain plays a well-defined role in the development of the entity, due to which the production process is maintained. The external environment influences the choice of a strategy. The perceptions of managers at all levels, as well as the culture and experience of the entity will influence the effectiveness of the strategies adopted.

Each type of customer plays an important role in the company's activity and objectives in the short and long term. Thus, marketing policies and strategies are developed in such a way as to have an effect on the target audience – final consumer, reseller and HoReCa customer.

The factorial analysis of the company's distribution market allowed us to estimate and calculate the impact of each type of consumer on sales per store and total METRO Moldova. From the calculations we noticed that the largest market share belongs to the final consumer, followed by resellers, and HoReCa customers constitute the lowest percentage without total sales. The company's strategy involves expanding the number of HoReCa customers, but it is influenced by external factors, such as state fiscal policy, competition, slow development of this type of business in the Republic of Moldova, etc.

Abstract: The values of the natural and socio-cultural heritage of Kosovo, respectively of the Rugova region are special both in terms of the importance of the studies and the value they contain. Nature has been generous with the virtues of this region reminding us of the quality and abundant amount of healing values that this place offers. Mountainous areas are opportunities for tourism development first for locals but also for other investors. The existing capacity building infrastructure for the production and processing of vegetation, forests, conservation and development of flora and fauna, studies and tourist promotion of caves, lakes, peaks up to 2403 m (Hajla), make for this area to continue scientific research and tourism interests. Almost daily participation in this terrain, direct observation of natural and cultural values, activities and attractions present, ski resort Boge, and many other events of socio-cultural nature of the local population as well as ongoing efforts by the side of the inhabitants for the construction of the capacities of the inns, the hotel, in addition to the more limited extent also the development of agriculture and livestock; we see opportunities for opening the socio-economic perspective. The tourism trend in the Rugova region is in the phase of transition and lack of construction of legal infrastructure, lack of spatial regulatory plan (non-issuance of construction permits) and restrictions on 4 areas of the park Bjeshkët e Nemuna and non-approval of residents' requests for withdrawal of timber damaged by strong winds as well as other requirements which would facilitate the well-being of the inhabitants.

Keywords: tourism, development, mountain, value, park, research.

INTRODUCTION

The values of the natural and socio-cultural heritage of Kosovo, respectively of the Rugova region are special both in terms of the importance of the studies and the value they contain. Nature has been generous with the virtues of this region reminding us of the quality and abundant amount of healing values that this place offers. Mountainous areas are opportunities for tourism development first for locals but also for other investors. The infrastructure of the existing capacities for the production and processing of vegetation, forests, conservation and development of flora and fauna, studies and tourist promotion of caves, lakes, high peaks up to 2403m (Hajla), make for this area to continue research scientific and tourist interests. Almost daily participation in this terrain, direct observation of natural and cultural values, activities and attractions present, ski resort in Boga, and many other events of socio-cultural nature of the local population as well as ongoing efforts by the inhabitants for the construction of the capacities of the inns, the hotel, in addition to the more limited mass also the development of agriculture and livestock; we see opportunities for opening up the socio-economic perspective.

At the end of the twentieth century (1999) the concept of cultural heritage given by UNESCO and internationally accepted, includes tangible and intangible cultural heritage as well as the environment. In the 2003 UNESCO Convention, intangible heritage was defined as: “Practices, representations, expressions, knowledge, skills, as well as instruments, objects, cultural areas together with communities, groups and individuals as part of their cultural heritage . This intangible cultural heritage passed down from generation to generation has been created by communities responsible for their environment, as a link between nature and history, providing them with identity and continuity as well as promoting respect for cultural diversity and human creativity...”¹

The tourism trend in the Rugova region is in the phase of transition and lack of construction of legal infrastructure, lack of spatial regulatory plan (non-issuance of construction permits) and restrictions on the four areas of the park Cursed Mountains and disapproval of residents' requests for withdrawal of

¹ UNESCO. Convention for the Safeguarding of the Intangible Cultural Heritage. 32nd Session of the General Conference, Paris, 2003. (cit. Prof. Dr. Jukka Jokilehto, On Definitions of Cultural Heritage, Heritage Theory Teoría sobre el Patrimonio, 2008, ICOMOS JURNAL, fq.21)

wood damaged by strong winds as well as other requirements which would facilitate the well-being of the inhabitants. Since identity is related to human beings and their position in society, it is related to how man sees himself in a society and how society sees him, even on this issue were taken authors of various disciplines of social sciences and of course this was approached from different aspects.² Rugova is the most frequented center of the Cursed Mountains massif. Activities that take place throughout the year are many: outdoor recreation, hunting, fishing, rural tourism, health tourism, rock climbing - mountaineering, mountain hiking, cave exploration, mountain biking, snowshoeing, skiing, camping, various adventures, day and weekend excursions, etc. Visits and stays take place in many localities, especially in Kuqishtë, Lakes, Shtupeq i Madh, Bogë, Lakes of the Lakes and some other localities.

At the entrance of the Rugova Gorge near the Patriarchate of Peja is the "Visitor Center", which offers services and information for tourists such as: maps, information brochures, traditional souvenirs and bicycles to visit the Rugova Gorge and the Cursed Mountains in general.³ The main economic activities that take place in the Park are mainly related to: the use of wood (limited only for heating), the use of pastures, tourist-recreational activities, the cultivation of medicinal plants and the collection of small fruits. The current development trend is focused on tourism, new construction and the adoption of existing facilities. It is estimated that most of these activities were carried out spontaneously, without any prior plan.

Medicinal plants and small fruits The area of KP "Cursed Mountains" includes a very large territory and rich in aromatic medicinal plants (BMA) and wild fruit trees (PFE), which is a potential in economic terms. The Istog Mountains, the northern side of Rugova, are characterized by plant crops with medicinal properties such as lincuri, wrinkle and some types of mushrooms.

leans towards the sun as the species is sun-loving and is found in relatively acidic soils. Properties and use

- Used against colds
- Against whooping cough;
- Against emphysema of the lungs and bronchitis (parentological condition of the lungs)
- Against neuralgic pain;
- Like tea

***Hypericum perforatum* - (St. Cantarion)** is used to treat cuts, burns, hemorrhoids, urinary tract, wound healing and as an antiseptic (external use), as well as liver disease, stomach pain and diarrhea (internal use) . The leaves and flowers of the plant have excellent healing properties for the body. They are mainly used to treat anxiety and sleep problems as well.

Fig.3. Source: author, Raspberry

Raspberries are widespread in the Rugova region and along the roads that connect the villages of this region we can find the Raspberry fruit. Raspberries contain amounts of iron and vitamin C. Its leaves and roots have medicinal properties. Tourists in the national park who are mostly local tourists are more focused on staying on weekends. The number of foreign visitors is smaller who come in an organized manner according to tourist offers.

The natural resources of the Rugova mountains determine the recreational and economic functioning of them, the ecology of natural structures can be taken as a sound basis for qualitative expansion and quantitative attractiveness that are in the function of tourism and for maintaining the progress of this natural environment. Only through tourism and thanks to it can the necessary tools be realized for protection.⁶ Small wooden houses have already started to be built, which are rented out to visitors who are thinking of spending the day or day and night. Summer tourism is enriched with the collection of

⁵ Photo taken at the raspberry cultivation plantation in the village of Drelaj, by farmer Dritan Shala, special field visit, September 2020.

⁶ Zeqir Veselaj “Cursed Mountains - Natural Pearl of Kosovo”, Prishtina, April 2010, p. 38

plants which serve for the best functioning of health. Along the roads leading to the villages of Rugova, tourists can find blueberries, strawberries, mushrooms, berries, as well as teas that serve to cure various diseases.

Livestock - The development of the extensive livestock sector as a seasonal activity, is a tradition that is cultivated in the hilly mountainous area (mountains) inside and in the area of influence by using the meadows and free outdoor pastures that are closer to the settlements. The people of Rugova have a tradition in the development of this activity which was once one of the most important sources of livelihood for them. Being a mountainous area, residents have already started expanding the construction of livestock stables. Undoubtedly, this trend of affirmation of tourism increasingly increases the interest of citizens to have private property in Rugova.

Agriculture and agricultural production is oriented towards animal feed products. The people of Rugova obtain white cereals and vegetables from their lands in the Dukagjini Plain. Today, in Rugova, barley, oats, rye and potatoes are cultivated in small areas. The processing of technical wood in recent years has begun to intensify. Rugovas, in addition to tables, agricultural tools and musical instruments, have begun to deal with even more carpentry (work of windows, doors, floorboards, etc.).

A part of the population, mainly women, whose labor is in demand in the market of Peja and beyond, are known for embroidering and sewing Rugova national clothes as well as processing carpets and indigenous handicraft items. Also, this activity is one of the sources of income of the Rugova area.⁷ Rugova gorge is rich in water resources such as the place called Black water, The springs of the tunnel (5th kilometer), Gurra e Sali Rama, The springs of the martyrs of Rugova, small waterfalls that promote not only the development of flora and fauna in this area but what is lately more interesting and arouses curiosity for researchers is the evident presence of wild goats and especially foxes.

The discovery of the Balkan lynx in Rugova (discovered in winter 2015) is one of the top successful achievements of Kosovo, in terms of wildlife, a special commitment of the environmental organization, "Era".⁸

Why should the law on the Cursed Mountains National Park be reviewed and amended?

A democratic, pluralistic society must always create the conditions for building a process of what it was, to always take into account the concerns of the inhabitants so that the energies it possesses are directed where they should be. In the situation we are in, it would be in the interest of all for this law to be returned for reconsideration, to the Assembly of Kosovo and the whole society should encourage, encourage, but also impose governance, that within the policies for the decentralization of the management of natural resources, to legalize the rights for properties denied in the past, which are numerous in this area, full and clear rights, for owners and users, as a universal right deriving from the card of human rights.

One of these very important actors is the Municipality which should have no obstacles to coordinate, direct and administer natural resources. Denial of property rights, spontaneous use, poverty, all these affect the damage to forests, but despite all this there is no willingness to give rights to owners.

And finally, after the recent reaction of residents, owners and addressing their requests once again for the highest bodies of the state of Kosovo is right and it is appropriate that once again this law be returned to the Assembly of Kosovo and the fair, reasonable requests of the inhabitants of Rugova are taken into account that the inhabited area and the cadastral zone of Rugova remain an area of economic development, an area which would be managed with the best possible laws, outside the National Park, but with the implementation of other necessary laws and in close cooperation with state, local bodies and the Rugova community. The economic development of the Rugova region is preceded by the idea of creating an eco-municipality which could contribute to the well-being of the inhabitants

⁷ Selman Lajçi "Economy of Rugova - Directions of development in the future", Gurra 8 magazine, June 1993.

⁸ Interview with Fatos Lajçi - environmentalist, leader of the Era organization, conducted on 16.12.2020

and encourage new investment projects. So societies create the mechanism of maintaining the strong position of national culture.⁹

After the end of the war in 1999, the opportunity was created for a deeper knowledge of the natural and cultural values of Kosovo, in this area of the mountainous region of Rugova.

PHPK Strategic Priorities "Cursed Mountains":

- Protection of environmental elements (air, water and soil) from pollution and degradation
- Protection of all types of forest vegetation from their degradation and illegal logging
- Protection from natural and man-made disasters
- Development of traditional agriculture, livestock and beekeeping for economic benefit and development of ecotourism
- Creating the image of the park and promoting tourism
- Provision of road infrastructure and transport
- Provision of electricity infrastructure
- Provision of water infrastructure

However, the field practice of implementing these priorities is poor. The difficulties and the impossibility to obtain a permit for the construction of stables and inns on their private properties shows the lack of seriousness of the work of the relevant institutions towards the inhabitants and farmers of these mountains. The issue of the Park should therefore be re-evaluated, re-studied in full compliance with other applicable laws. The numerous restrictions imposed by the law on the Cursed Mountains Park run counter to human and property rights and inheritance. In this region the inhabitants are still born, grow and die and are buried. This indigenous Kelmendas country known and inhabited for more than three centuries requires a more reasonable approach to the treatment and importance of using private property.

Some of the natural and cultural values of the Rugova region:

Caves - Caves have high tourist and study values.

"Gryka e Madhe" Cave - is located in the third kilometer of Rugova Gorge. The entrance of the cave is located at an altitude of 637m. The length of the corridors and the passable gallery is about 13,450 m".¹⁰ Gryka e Madhe Cave, with the shapes created by the rocks, presents shapes that have a bright glow. So, it possesses rare natural, scientific, tourist values, first of all because it presents a special labyrinth and is of special importance for the realization of research of scientific nature but especially for the development of tourism.

⁹ Ibrahim Berisha, Cultural Networks - Closings and Openings in Kosovo, Prishtina, 2020, p. 276.

¹⁰ Zeqir Veselaj "Cursed Mountains-natural pearl of Kosovo", Prishtina, April 2010, p.31.

11

Fig. 4. Gryka e Madhe - Cave

Queen Shpresa Cave is located in the third kilometer of the Rugova Gorge. There are many myths about this cave. Unfortunately this cave has not yet been explored. This cave does not even appear on the tourist maps of Kosovo.¹²

13

Fig.5. Queen Hope - Cave

This is not only the property of Rugova, there are other caves as natural monuments in one and along the gorge we distinguish: Karamakaz cave, Radac cave, cave along Gërle e Koshutanit, cave near Gurra e Rujs and on the opposite slope in Drelaj. At the fifth kilometer are the caves of Jerina, and a little further down, the cave of Demaj.¹⁴ The national park "Cursed Mountains" for eight years now since the adoption of the law on this park lacks a zonal map and a detailed regulatory plan for the villages of this region.

11 <https://www.albinfo.ch/shpella-gryka-e-madhe-e-rugoves-hapet-per-visitore/> (taken from the internet on 30.4.2021)

12 <http://infoglobi.info/pamje-nga-shpella-e-mbretereshes/> (taken on 04.06.2015)

13 <http://www.zemrashqiptare.net/news/33123/sejdi-berisha-shpella-e-mbretereshes.html> (taken from the internet on 30.4.2021)

14 <https://kk.rks-gov.net/peje/Assemble-5.aspx> (retrieved from the internet on 04.06.2015)

Therefore, in this whole part inhabited mainly by autochthonous inhabitants, in the absence of timely non-planning of the regulatory plan, the inhabitants face difficulties, obstacles to the use of private property such as: limitation of the possibility of building inns, restaurants, houses. Even the forests damaged by the winds on their private properties are not allowed to be used as a result of the negligence and irresponsibility of the relevant institutions in assessing the actual condition of the trees.

The mountainous geographical environment made the people here build tools by which they would be served for their needs. Particularly valuable are the various objects with artistic wood carvings, such as house objects or public and religious objects in this mountainous region.¹⁵

The mountains and rural areas of Peja with the surrounding towns are the starting point of the Via Dinarica trails, constitute the main roads of the National Park "Cursed Mountains", which covers 90% of the trails. Established by the Assembly of Kosovo in December 2012, it is the largest protected area in Kosovo.¹⁶

Deforestation and degradation

The activity of illegal logging is a well-known phenomenon in Rugova, but this logging is characterized by a number of factors which in a way are related to the socio-economic life of Rugova residents. Historically, the maintenance of life, in addition to beneficial animals, by the Rugovas has been done by cutting down forests to meet their needs, because the houses of the Rugovas have mainly been, and continue to be, made of wood material. But, apart from this fact, the residents there have used this illegal logging activity for material benefits, which is contrary to the laws on forests. Of course, the amount of deforestation is alarming and carries serious consequences. "Apart from the loss of timber that takes decades to regenerate, they also reflect ecosystem disruption, landscape degradation, and wildlife disturbance. "Such degradation of forests is being followed by a marked erosion of forest lands." An extraordinary threat is the burning of forests.

Fig.6. Source: author. Deforestation in Rugova

Manifestation Traditional games of Rugova - are popular games of the Rugova region that have the character of a continuous presentation of the customary tradition of a variety that according to the content are: Games of physical and combat skills of men, humorous and fun games, songs, dances and rites. The games have an early origin that are usually held and are held in August immediately after the mowing of the meadows and are held in the northern part of the Albanian-Rugova ethnicity. So far they have been held in Qafë Hajlë, Bogë and now in Kuqishtë. The gathering is open, known to the public, attended by all the villages of Rugova and the surrounding area, Peja and other neighboring

¹⁵ Mark Tirta, *Albanian Ethnoculture - doctrinal law*, Academy of Sciences of Albania, Tirana, 2016, p. 275.

¹⁶ *Via Dinarica*, hiking guide for the cross-border area of Montenegro and Kosovo, bot. Center for Sustainable Tourism Initiatives, Community Development Fund - CDF, Peja Kosovo; Podgorica, 2017, p. 124.

municipalities and is always growing and taking on the character of a rural Olympics of the Albanian Alps. The traditional games are under the patronage of the Mayor and are organized by the Municipality of Peja, the community, the Albanological Institute, the Association of Traditional Sports and Games-Rugova, the Folklore Ensemble "Rugova" and the Territorial Community of Rugova. The traditional games of Rugova are a precious treasure of Rugova culture in particular, but also of the Albanian ethnicity in general. These games have been preserved from generation to generation, despite the difficulties they have survived and today are preserved and developed by the inhabitants of Rugova. Traditional games began to be organized for the public around the 90s, by a group of intellectuals. "Organizing council of these games were: Mr.sc.Selman Lajçi (martyr), Ymer Neziri, Vesel Nikçi, Shaban Lulaj, Ali Daci, Fazli Muriqi, Sylë Nikçi etc."¹⁷

However, the indigenous games of this area have been played by shepherds and residents continuously, in early times and periods, but not in an organized way for the masses. Throughout memory but even now games are a form of physical and spiritual activity. Nowadays, the traditional games of Rugova are supplemented with other disciplines and the interest for them is always growing. Traditionally, early emigrants from this region, such as the Kelmendis of Mitrovica and those of Sibovc, who from a sociological point of view are seen as a kind of rapprochement, socialization among themselves, which preserves the sense of common origin, and this in addition to participation is also manifested by cultural dots. In the 2013 edition of the traditional games, for the 21st time in a row, there were participants from Albania, from the Vuthaj of Montenegro, the Albanian Highlands of Rozhaja, the Kelmendas of Mitrovica and those of Sibovc, each in their own way have revealed their cultural and historical heritage. So, the traditional games of Rugova are still being held and the interest of people to be in this manifestation is growing. The period of organization of these games is usually the month of August, This is also due to the great desire of the emigrants to enjoy them up close. Also, at the end of the event, cups and gratitude are distributed to the winners of the games.

Results from the questionnaire for collecting information for the scientific paper "Potentials of Eco-Tourism Development in the Mountain Region of Rugova" conducted with respondents in March-April 2020.

200 (two hundred) respondents participated in the questionnaire, of which 158 or (79%) were male and 42 or (21%) were female.

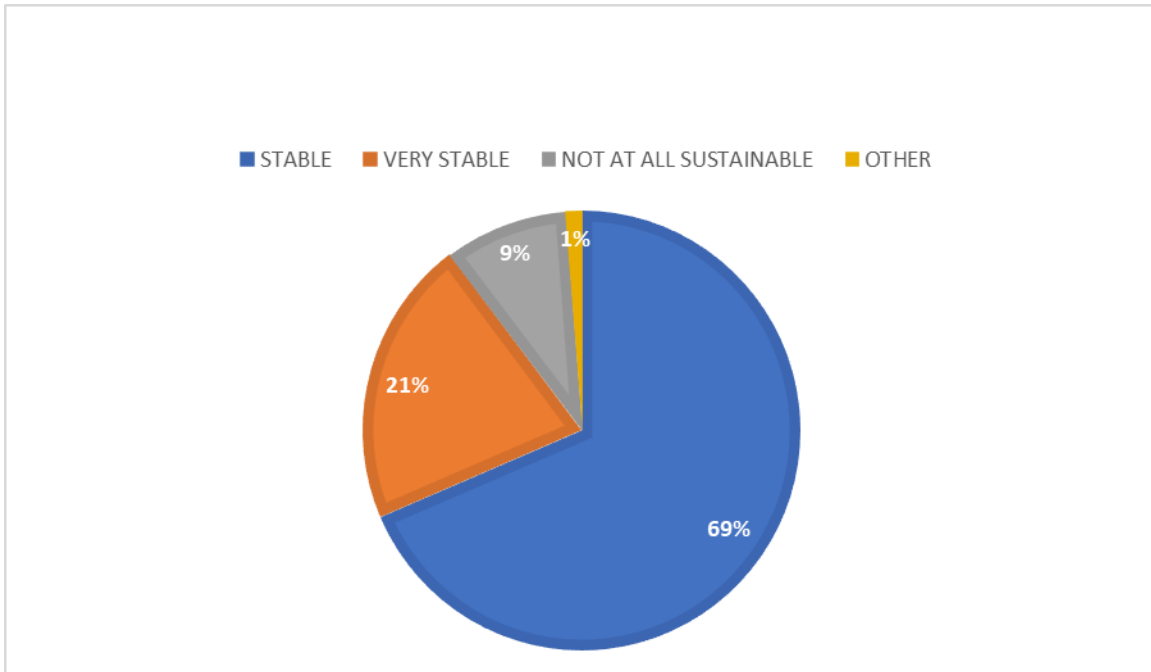

The age of the participating respondents is mainly young age. This shows mainly their opinions that constitute the structure of recognizing the answers from this age category that leads with 45% or 91 respondents that make up the age between 26-35 years. Also, the data in this questionnaire are as a result of the participation of respondents of this age and the judgment derived from this results, presents the position of about half of the respondents who responded to the questionnaire. The participation of young people aged 18-25 is 25% or 50 respondents, which is also given by young people.

The education of the respondents participating in the research is mainly with higher education. Their opinions undoubtedly show the possibility to be more informed about the topics addressed in relation to those of secondary and primary education. So, 78.5% or 157 respondents are with higher education. 20.5% or 41 respondents with secondary education and 1% or 2 respondents with primary education.

Employment - Out of 200 respondents who have been part of the research on their employment issue, they are almost not far from the employed and unemployed. Thus, 56.5% or 113 respondents are declared employed and 43.5% or 87 respondents are unemployed.

1. How do you assess the Rugova Cultural Identity from the point of view of preserving and cultivating socio-cultural values today?

How do you assess the Rugova Cultural Identity from the point of view of preserving and cultivating socio-cultural values today? Respondents' answers are as follows:

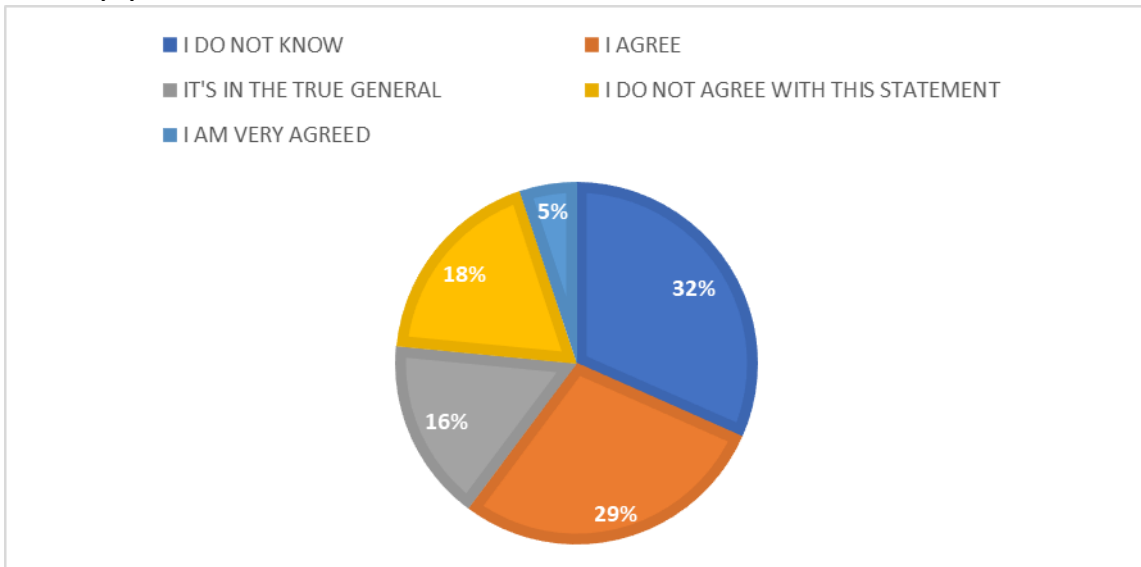

68% or 136 of the persons answered "Stable". 21% or 42 of the persons answered "very consistent". 9% or 18 people answered "not at all stable". 2% or 4 people answered "Other".

2. How much have the Rugova traditions, customs, customs and social norms been transformed after the last war in 1999?

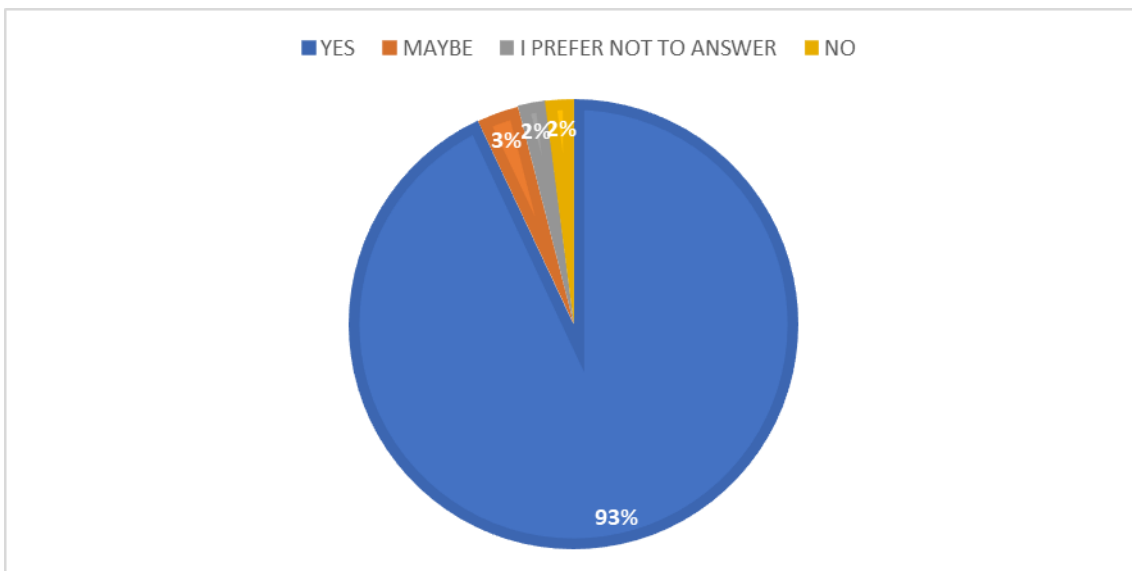

How much have the traditions, customs, customs and social norms of Rugova been transformed after the last war in 1999? Respondents' answers are as follows: 73.5% or 147 respondents answered Partially transformed, 12.5% or 25 respondents answered Completely transformed, 9% or 18 respondents Prefer not to answer, 5% or 10 respondents answered Not at all transformed.

3. What do you think, is Cultural Tourism preserving the cultural originality of the local population?

What do you think, is Cultural Tourism preserving the cultural originality of the local population? The answers are as follows: 31% or 63 respondents answered "I do not know". 38.5% or 57 respondents answered "I agree". 18.5 or 37 respondents answered "I do not agree with this statement". 16% or 32 respondents answered "It is generally true". 5.5% or 11 respondents answered "I strongly agree".

4. Do you think that the traditional Rugova Games and the folk ensemble "Rugova" are a special value of Albanian culture?

Do you think that the traditional Rugova Games and the Folklore Ensemble "Rugova" are a special value of Albanian culture? The answers are as follows: 93.5% or 187 respondents answered "YES". 3% or 6 respondents answered "Maybe". 1.5% or 3 respondents with "I prefer not to answer". 1% or 2 respondents answered "NO" and 1% or 2 respondents answered "I do not know".

5. Do you agree to develop businesses for tourism in Rugova?

Do you agree to develop businesses for tourism in Rugova? The answers were given as follows: 47% or 94 respondents answered "I agree". 32% or 64 respondents answered "I strongly agree". 12.5% or 25 respondents answered "Partially agree". 6% or 12 respondents answered "I do not know". While 2.5% or 5 respondents answered "I do not agree".

6. Will tourism development help preserve cultural heritage?

The answers were given as follows: 47.5% or 95 respondents answered "I agree". 23% or 46 respondents answered "I completely agree". 12% or 24 respondents answered "It is generally true". 10.5% or 21 respondents answered "I do not know". While 7% or 14 respondents answered "I do not agree with this statement".

7. Has tourism improved the life of the area community?

Has tourism improved the life of the area community? Answers: 51% or 102 respondents answered "I agree". 20% or 40 respondents answered "I completely agree". 17.5% or 35 respondents answered "It is generally true". 8% or 16 respondents answered "I do not know". While 3.5% or 7 respondents "I no longer agree with this statement."

CONCLUSION

Rugova, a small mountainous province which lies in the foothills of the Albanian Alps, is one of the prominent provinces. This region is rich in natural, cultural and spiritual riches. The inhabitants of Rugova are known for their hospitality. In the chain of tradition over the centuries they preserved the culture, customs and traditions, heroic songs, white scarf, traditional games, folk costumes and a variety of assets, always being faithful to the autochthonous homeland of Kelmendi. Rugova in its natural, cultural and spiritual treasury has a lot of wealth and as such is thought to be in the future an ecological municipality with a tendency to develop tourism and economy. The Rugova region offers many opportunities throughout the seasons, becoming known for its landscape features, caves, waterfalls and lakes, flora and fauna. Undoubtedly, the cultural and spiritual values of Rugova represent a typical mountain culture with rich features, such as the heroic songs, which were the inspiration of patriotism for many generations, lahuta as a personification of their own along with the traditional dress. Dress, dance, games, weddings, etc. are a special presentation of the Rugova highlanders. While today, the autochthonous folk ensemble "Rugova" has a role in promoting the Rugova tradition.

However, Rugova is being seen as a place of attraction for tourists and investors, being awarded the "Balkan Peaks" prize by the World Tourism and Travel Council. This is a priority for Rugova as well as for the promotion of its natural resources. So, this region offers many opportunities for recreational and sports activities, which requires new investments in this field. Hiking trails, lakes, waterfalls and wells make Rugova an attractive tourist center.

However, the people of Rugova continue to face difficulties such as: Lack of health care center, lack of road infrastructure, lack of internet access, dissatisfaction with the national park "Cursed Mountains", ownership issues and the border with Montenegro. The challenge for the conservation of biodiversity in Rugova is also the wild hunting, the pollution of the environment and the degradation of the forests for which more work remains to be done. Also, Rugova lacks economies, which would alleviate the economic and social situation of the inhabitants, except for some households that are mainly restaurants and two existing factories: "Water Rugove" and "Cheese Rugove". However, the natural and cultural values of Rugova are assets which every day more and more are taking the form of recognition at the international level.

Abstract: Resistance to change is considered one of the biggest challenges that change initiatives face within organizations and one of the main reasons for organizational change failure. Resistance to change is perceived as a given and change management models account for it unanimously. However, the change management models suggest the same approach, irrespective of the characteristic of the change, the organizational context or the organizational culture within which the change is initiated. The change management models do not account for the fact that the attitudes towards change of the individuals affected by it can be substantially different based on the change characteristics, such as magnitude or timing, the context, such as the moment in the organizational life cycle, respectively the culture, which can manifest different levels of openness to change. Thus, in order to successfully reduce resistance and increase readiness for change, the approach needs to be tailored every time to the specific situation where the change is initiated. Scholars have observed different potential reactions of individuals in the face of change, from enthusiastic acceptance to active opposition. Additionally, researchers have created cultural models that identify several dimensions to define an organization's culture. This paper focuses on how culture affects the response of the change recipients when confronted with a change initiative, which will help change initiators tailor their change management approaches, thus increasing their chances to reduce change resistance and implement change successfully.

Keywords: Change management, resistance to change, organizational culture, cultural dimensions, types of resistance.

1. INTRODUCTION

Organizational change, whether spontaneous or planned, is a constant in organizations' life cycles. Some scholars state that 70% of the change initiatives fail (Beer and Noria, 2000a), while others argue whether this estimate is indeed accurate, questioning the methodology employed in the studies that yield these results and the way failure was defined (Hughes, 2011). Nevertheless, irrespective of the failure rate and even though individuals can also have a positive attitude towards change, most scholars agree that one of the biggest challenges faced by change initiative is the occurrence of resistance to change of the individuals expected to accept, understand, internalize, act upon and ultimately live with the respective change (Lewin, 1951, cited by Hussein, 2018). While processes, technology or organizational structure can be managed, individuals have a mind of their own and a multitude of factors influence their attitude towards change. Thus, the field of change management has emerged to address what Hiatt (2003) has defined as the people side of change. The factors affecting the resistance to change can emerge intrinsically or extrinsically, and only some can be influence to some degree by change initiators, respectively change agents, while others are not within their ability to change.

Various change management models, such as Lewin's from 1951 (cited by Hussain, 2018), Satir from 1985 (cited by Woods, 1984), Kotter's (1996) or Hiatt's (2006), have addressed resistance to change with the purpose of reducing it. A consensus across these models has been that the following aspects, when employed successfully, can increase affect individual's readiness for change positively: (a) communication about the change, (b) knowledge on how to be successful during the change, as well as in the future state, and (c) rewards when the desired behaviors are elicited. These models, however, suggest the same approaches, irrespective of the context and do not take the cultural aspect into consideration.

Rafferty (2012) introduces the concept that change resistance occurs at individual, group, respectively organizational level and on each of these levels there are a multitude of potential factors influencing an individual's attitude towards change. Culture stems from a personal level, but also from being part of a group or organization. As Harzing and Hofstede (1996) mention, "Resistance to change has a universal, a

cultural and a personal aspect” (p. 312). This paper will focus on the resistance that is observed at the level of the group or organization that is affected by the change.

2. LITERATURE REVIEW

Organizational culture is “the set of shared, taken-for granted implicit assumptions that a group holds and that determines how it perceives, thinks about and reacts to its various environments” (Schein, 1996, p. 236). According to Barrett (2008), culture is overarching, influencing the organization as a whole: “Culture permeates every aspect of our company. It is our essence, our DNA, our present, and our future” (p. 6). Similarly, in their study analyzing 121 cultural models, Taras et al. (2009), concluded that the vastly used definition of culture is a “group’s shared set of distinct basic assumptions, values, practices, and artifacts that are formed and retained over a long period of time” (p. 359). Hofstede (1980) states that it is harder to change culture short-term, because it has been created over a longer period of time.

The culture stems from the individual, i.e. their personal national background, group level, i.e. the cultural within the department, organizational level, i.e. the cultural of the organization at large and the national level, i.e. the culture of the country they are part of. It is hard to distinguish between the above, however they add up to the cultural context in which the change takes place. The most common means of assessing culture proposed by literature has been to conduct a survey within the group affected by the change, even though this approach has been criticized by Taras et al. (2009).

From a change management perspective, Erdogan et al. (2006) believe that a change management approach should take organizational culture into consideration to increase its chances of success. Carlström and Ekman (2012) reiterate that culture is formed through a combination of values, assumptions, beliefs and behaviors, and that they influence change, individuals and their performance. Abdulla et al. (2017) agree that these cultural dimensions dictate to some degree the attitude individuals have towards change. Schein (1990, p. 111) states that “culture is what a group learns over a period of time as that group solves its problems of survival in an external environment and its problems of internal integration”, which also includes changes, whether generated from the inside or by a force external to the organization.

Taras et al. (2009) gathered that it is hard to create a model that covers comprehensively all aspects of the complexity of culture. In the attempt to improve this, the number of the dimensions per cultural model has increased throughout the years, which, in turn, has made the models more difficult to employ: from the original four to the current six dimensions of Hofstede’s model (1980), to the seven of Trompenaar’s model (1993), to ten offered by Schartz (1994), to six tri-dimensional constructs by Maznevski and DiStefano (1995), to eighteen of the GLOBE model of culture (House et al., 2004). While Hofstede (1980) believes that the dimensions are universal and apply to every culture, Taras et al. consider that a tailored approach would be more suitable, suggesting that different dimensions are of significance from organization to organization.

3. RESEARCH METHOD

For the purpose of this paper, qualitative research methodology has been employed in the form of literature review through which multiple articles have been reviewed and critically analyzed. The discussions presented in this paper have their foundations in a thorough study of the academic literature that deals with change resistance and with culture. The pool of data used for research has been gathered through extensive searches over the Internet of web pages and articles published in the English language containing the following keywords: Change management, resistance to change, organizational culture, cultural dimensions, types of resistance. Thus, the findings of this article present a picture of the English-speaking landscape in which the concepts have originated and where they have attracted the most attention.

The information gathered from these various sources is pieced together to trace the cultural aspects impacting individuals and group’s resistance to change. The aspects have been separated into categories

that could potentially help change initiators assess the resistance prior to a change initiative based and identify measures that could be employed to reduce it. In the end, suggestions have been made for further research.

4. ANALYSIS

Hofstede (2011) identifies six dimensions to describe culture: power distance, uncertainty avoidance, individualism vs. collectivism, masculinity vs. femininity, long vs. short term orientation, and indulgence vs. restraint. The dimensions are defined below.

- (1) Power distance, small vs. large: The “degree of inequality” (p. 304) between managers and their employees.
- (2) Individualism vs. Collectivism: The “degree to which people in a country prefer to act as individuals rather than as members of groups” (p. 304).
- (3) Masculinity vs. Femininity: The degree to which people value “assertiveness, performance, success, and competition” (associated with the masculine) versus “quality of life, maintaining warm relationships, service, care for the weak, and solidarity” (associated with the feminine) (p. 304).
- (4) Uncertainty avoidance: The degree to which people prefer structure and rules to guide their reactions and behavior in given situations.
- (5) Long-term versus short-term normative orientation: The degree to which people welcome change and plan for the future.
- (6) Indulgence vs. restraint: The degree to which having fun and enjoying life is perceived as acceptable.

Hofstede’s dimensions a widely used to describe national, as well as organizational cultures. Taras et. al (2009) performed a comprehensive literature review of all the cultural models emerging between 1952 and 2009. They concluded that the majority of models (97.5%) contain at least some measures that are covered by Hofstede’s model, even though labeled different. For example, in the other models, individualism vs. collectivism is alternatively labeled as “self vs. group interest”, “teamwork and cooperation” or “social responsibility”, masculinity vs. femininity is labeled as “assertiveness” or “gender equality”, etc. A few dimensions, such as “relationship to environment” or “determinism vs. fate” are unique measures and are not covered by Hofstede’s model. Taras et. al believe that these measure can be useful in specific situations and that the dimensions should be adapted to the respective contexts.

Since the analysis of Taras et. al (2009), a newer model had emerged. Meyer (2014) identified 8 scales that define a culture, specifically in the professional environment: communicating, evaluating, persuading, leading, deciding, trusting, disagreeing, scheduling. The scales are defined below.

- (1) Communicating: Ranges from low-context, i.e. “precise, simple and clear”, to high-context, i.e. “sophisticated, nuanced, and layered”, where messages are “read between the lines” (p. 39).
- (2) Evaluating: Ranges from direct negative feedback, i.e. provided “frankly, bluntly, honestly”, without “softened by positive” messages, to indirect negative feedback, i.e. provided “softly, subtly, diplomatically”, with positive messages wrapped around negative ones (p.69).
- (3) Persuading: Ranges from principles-first, i.e. with primary emphasis on theoretical framework, to application-first, i.e. with primary emphasis on the practical and concrete application.
- (4) Leading: Ranges from egalitarian, i.e. low distance between manager and employees and flat organizational structures, to hierarchical, i.e. high distance between manager and employees and high importance of status.

- (5) Deciding: Ranges from consensual, i.e. decision made through unanimous agreement, to top-down, i.e. decision are made by the manager.
- (6) Trusting: Ranges from task-based, i.e. “trust is built through business-related activities” and relationships change “based on the practicality of the situation”, to relationship-based, i.e. trust is built through sharing meals, evening drinks, and visits at the coffee machine, while “relationships build up slowly over the long term” (p. 171)
- (7) Disagreeing: Ranges from confrontational, i.e. disagreements, debates and open confrontation are seem as constructive, to avoiding confrontation, where the above are perceived as inappropriate, having a negative for the team or organization.
- (8) Scheduling: Ranges from linear-time, i.e. project steps are completed in a linear sequence, without interruption with focus on the deadline, to flexible-time, i.e. project steps are completed in a fluid manner, adapting and changing as external factors arise, while interruption as accepted.

These aspects affect how individuals lead, think and behave in their professional lives in different countries and emphasizes that, in order to be successful and get things done in a certain culture, it is important to play by that culture’s rules.

A resemblance can be observed between Hofstede’s dimensions and Meyer’s scales, however, each model contains aspects that are not covered by the other. The table below highlights the similarities and differences. Please note that this is an approximation, rather than a straight forward parallel.

Figure 1: Similarities and differences between Hofstede’s (2011) and Meyer’s (2014) models.

Geert Hofstede's Cultural Dimensions	Erin Meyer's Eight Scale Culture Model
Power Distance (small vs. large)	Leading (egalitarian vs. hierarchical)
	Disagreeing (allowing vs. avoiding confrontation)
	Deciding (consensual vs. top-down)
Individualism vs. Collectivism	Trusting (task-based vs. relationship-based)
Masculinity vs. Femininity	Evaluating (direct vs. indirect negative feedback)
	Disagreeing (allowing vs. avoiding confrontation)
Uncertainty Avoidance	-
Long vs. Short Term Orientation	Scheduling (linear vs. flexible time)
Indulgence vs. Restraint	-
-	Persuading (principles vs. application first)
-	Communicating (high vs. low context)

Source: Author’s own analysis.

As previously mentioned, a variety of factors affect individuals’ attitude towards change, among them culture. While culture is harder to change short-term, because it has been created and has evolved over a longer period of time, it is valuable to understand it, in order increase the chances of success of a change initiative. Furthermore, understanding culture will provide insight into a change management plan that best suites the existing culture.

Scholars observed different reactions individuals have in face of change. Coghlan (1993) recognized seven different degrees of acceptance of change: (1) enthusiastic acceptance, (2) cooperation, (3) passive resignation, (4) indifference, (5) apathy (6) passive resistance or (7) active and open opposition. Bennis, as quoted by (Coghlan, 1993), identifies six types of responses the individuals may have to change: (1) oppose, (2) resist, (3) tolerate, (4) accept, (5) support or (6) embrace. These reactions are influenced by culture, meaning that culture can have a mediating role in reducing change resistance, thus opening an individual towards change (Abdulla et al., 2017). Although it is hard to anticipate the exact reaction people will elicit in response to a change initiative, Harzing and Hofstede (1996) were

able to suggest, based on an empirical study, how the cultural dimensions could predict individuals' expected resistance to change.

5. DISCUSSION

From the existing dimensions, the authors concluded that power distance, individualism, uncertainty avoidance and time orientation affect individuals' attitude towards change, as follows:

- The higher the power distance, where the leader is perceived as owning the truth, the lower the resistance to change from the employees will be.
- The higher the individualism, meaning the individual's independence from the group, the lower the resistance, while the collectivistic cultures tend to hold onto tradition and their ways.
- The higher the uncertainty avoidance within a culture, the higher the change resistance.
- The higher the long-term orientation, the lower the change resistance.

Through the parallel created between the two models presented in the table, it could be roughly assumed that following scales affect resistance negatively, meaning the more tendency towards following ends of the spectrum are expected to lead to lower levels of resistance:

- Hierarchical culture.
- Top-down deciding.
- Task-based trusting.
- Confrontation avoidance.

For the rest of Meyer's scales, it is inconclusive if and how they affect individuals' attitude towards change at this point and more research is needed for conclusions to be drawn with regards to this.

A combination between Meyer's Eight Scale Model and Hofstede's Dimensions could be a helpful in designing the successful change management plan. As aforementioned, most change management models deem as important following aspects: communication about the change, knowledge on how to be successful during the change, as well as in the future state, and rewards when the desired behaviors are elicited.

As Meyer states, the scale that potentially influences change management initiatives the most is Persuading. Knowing which to bring forward first, the principles or the applications, is important in convincing employees for the needs for change. Meyer suggest alternating between the two. Furthermore, the change initiators can anticipate the level of confrontation when Disagreeing, thus preparing with arguments and rationales to bring the employees on board with the change.

Although Meyer recommends a low context Communicating in most of the cases, in order for the change initiative to be understood clearly, it might be that in some organizations, based on the culture, the nuances and sophistications of the Communicating style need to also be taken into consideration.

In high Power Distance cultures or hierarchical Leading style, when potentially the Deciding is top-down, it could be assumed that the change agents need to be the higher ranked managers. Even though Hiatt (2006) suggests that change agents can be selected based on their informal role in the organization or with in their teams, the above-mentioned cultures will probably not respond as desired if this strategy is used. Furthermore, if their position and influence is important, the change initiators could put more emphasis on preparation and training, to provide the individuals affected by change with the required skills and knowledge to be successful in the future state.

Being aware of whether relationships or traditions, or both, i.e. the Individualism dimension and the Trusting scale, are important to the individuals affected by change, helps in creating a change management plan that takes this into account. The plan will need to maintain or sustain these two components of people's lives, find ways to compensate for them or provide support, as well as acknowledge it openly as a consequence of the change.

An important impact on individuals' attitude towards change is the uncertainty avoidance from Hofstede's model. A high uncertainty avoidance requires a thorough analysis of what individuals are

challenged by the most and provide them with the needed reassurance, tools and ongoing support for them to become more comfortable with and more open towards the change.

From a time perspective, change initiators should account for modifications, adjustments and need for tolerance for the change that might occur to the change management plan in a flexible-time or short-term oriented culture. They could either find counter-measures or simply expect those modifications and respond as they occur.

Lastly, in order to reinforce desired behavior, change management scholars suggest rewards and celebration of successes. For this, Evaluating is important. Meyer recommends indirect negative feedback, especially because change can be challenging for individuals, however, in some cultures, in order for the message to be received, it could be more effective to be more direct in giving feedback.

6. CONCLUSION

For a project or change initiative to be successful, a change management plan needs to be in place. Several change management models have been created throughout time. Their common denominators are creating an effective communication plan, provide employees with the necessary knowledge and skills to be confident and successful in future state, and have a rewards system in place to encourage individuals when they elicit the desired behavior.

The models, however, suggest the same approach, without specifically taking culture into account. Failing to account for the characteristic of the respective organizational culture, might affect negatively the success of the change initiative. Several models have been created with the purpose of assessing culture. Potentially the most popular and widely used model is the Hofstede Six Dimensions Model. The reasons are that (1) the Hofstede model was one of the first cultural models, (2) the dimensions cover largely the dimensions of the other models, and (3) the models with more dimensions become too complex to employ in practical situations.

More recently, Meyer developed a cultural model, consisting of eight scales that are mostly applicable to the professional environment. A combination between the two models helps change initiators to (a) assess the existing culture, and so the expected attitude towards change, as well as (b) create a change management plan that accounts for the respective context, thus identify the right strategies and tools that are appropriate for it.

Further research is needed in order to validate empirically the influence of Meyer's scales on individual's attitude towards change, as well as to come up with concrete suggestions of change management strategies and tools that would be appropriate for the different cultural context.

Abstract: The outbreak of the novel coronavirus caused deaths, economic disruptions, and serious consequence on livelihood in over 216 countries with 132,573, 627 confirmed cases and a death toll of 2,876,412 as of April 06, 2021. South Africa (1,552,416) has the highest recorded cases in Africa. This study investigates the impact of the COVID-19 pandemic on teaching and learning, its transformation of traditional method of education in Africa into digital and technological learning management information systems. The study was based on secondary information sourced from published articles, international organizations' reports (WHO, UNESCO, WORLD BANK, etc.), journals and web portals. It was revealed that the impact of the pandemic on education was both positive and negative. Negatively, most educational institutions across Africa had to close irrespective of the extent of work done in the term. With no prior efficient training in teaching through digitization some institutions resorted to online teaching to prevent the virus from spreading. Positively, it is improving the digital infrastructure since schools resolved to teaching and learning on digital platforms while government assisted primary and secondary schools adopted televised and radio broadcast. Furthermore, teachers and students who were not prepared to apply ICT suddenly could learn several software.

Key Words: COVID-19, Teaching, Learning, Africa, Technology

1. INTRODUCTION

The impact of the novel coronavirus code named COVID-19 was felt in all facets of life particularly the socio-economic. The educational sector was one of the hardest hits by this pandemic due to social distancing. As of mid-April 2020, as a measure to prevent the spread of the coronavirus, 195 countries had closed their school system including institutions of higher learning which affected approximately 1.3 billion students across the globe (UNESCO Monitoring Report, 2020).

COVID-19 was first discovered in late December 2019 as a virus in a market in China, Wuhan, Hubei Province and was declared a pandemic by the World Health Organization (WHO) on March 11, 2020. The novel coronavirus called "COVID-19" is a different virus linked to the same family of viruses as severe acute respiratory syndrome (SARS) and certain kinds of common cold (Bender, 2020). It is spread through direct contact with respirational drops of an infected person (either by coughing or sneezing). One could also be contaminated by touching virus-infected surfaces and in turn touching their face (e.g., eyes, nose, mouth) (Bender, 2020).

As of April 06, 2021, the coronavirus has spread to 216 countries and territories with 132,573, 627 confirmed cases and a death toll of 2,876,412. The trend of the first three countries with highest confirmed cases in the world and in Africa: The United States has the highest confirmed cases in the world (31,499,322), followed by Brazil (13,023,189), India (12,695,493) by way of listing. South Africa (1,552,416) has the highest recorded cases in Africa followed by Morocco (499,025) and Tunisia (263,043) (Worldometers, 2021).

Educational institutions ranging right from nursery/kindergarten to tertiary education had their teaching and learning disrupted. Governments had to shut down schools that are one aspect of public gatherings to contain the spread of the virus and to protect the lives of future generations. South Africa declared its national state of disaster on March 15, 2020 Mhlanga and Moloji (2020), closing kindergarten, primary, secondary and institutions of higher learning other sectors of the economy. Ghana closed its schools and imposed lockdown to two of its regions, namely Accra and Kumasi on March 30 and later extended it to the rest of the country (GardaWorld. com, 2020). Kenya, Nigeria, Benin, Uganda, Cote d'Ivoire, Rwanda and other African countries did the same between March and April 2020. In addition to the

closure of schools, African governments designed and implemented extraordinary policies like the restriction of public gatherings, wearing of face mask, social distancing and good hygiene practices as advised by WHO to decelerate the growth rate of infections (Hsiang et al., 2020; Rutayisire et al. and Atuguba, 2020). So far, Africa accounts for a total of 4, 324,953 confirmed COVID-19 cases, approximately 3.3% of the world confirmed cases as April 06, 2021(Galal, 2021).

According to (UNESCO, 2020), about 40 million teachers, 1.3 billion students and youth worldwide were affected by the closure of schools due to COVID-19 pandemic. Teachers are learning effective and innovative online teaching mechanisms and strategies, while students also adjust to having online classes, interactions, instructions and examinations. The aim of this study is to investigate the impact of the COVID-19 pandemic on teaching and learning, how it has transformed the traditional method of education in the world particularly, Africa into digital and technological learning management information systems.

This paper is prearranged in the following format. Next is the description of the research method used for this work, followed by discussion and findings. Lastly, conclusions and recommendations for tackling the impact of COVID-19 are offered.

2. MATERIALS AND METHODS

The study was based on secondary information sourced from published articles and international organizations' reports (WHO, UNESCO, UNICEF AND WORLD BANK etc.), online journals and web portals. Journal searches were conducted through Google Scholar. An analysis of the literature review involved collection, sorting out relevant data, the discussion of results and conclusion.

According to (Windle, 2010), secondary data analysis is cost effective, efficient, convenient and time saving compared to primary data collection. Moreover, existing data contain the substance of significance to the researcher and other interested parties than responding to new research questions. Hence, secondary analysis was desirable (particularly when there is a time constraint).

3. RESULTS AND DISCUSSIONS

Studies showed that teaching and learning were severely affected by the pandemic taking into account challenges, limitations, complexities faced by governments, educational institutions and their stakeholders across the world (Atuguba, 2020; Assunção Flores and Gago, 2020; Zhang et al. 2020; Judd et al. 2020). Again, reviewing literature on this issue revealed several initiatives taken by African governments to ensure continuity in teaching and learning. These were decisions taken based on stakeholder engagements to alleviate the impact of COVID-19 on education not only in some parts of Africa but the entire globe (Assunção Flores and Gago, 2020). Policies adapted (examples: washing of hands, checking of temperature and wearing of face masks) unearthed certain challenges in teaching and learning as well as opportunities for improvement. These policies gave an indication that, teaching and learning are skewed majorly toward one direction: face-to-face contact with less investment in ICT infrastructure.

3.1 Challenges on Teaching and Learning in Africa

African countries are facing numerous challenges whenever it comes to teaching and learning before the inception of COVID-19. Some of these problems are scarcity of relevant textbooks, instructional materials, asymmetrical in-service training, blend of ICT into teaching methods, and quality-teaching environment to mention but a few.

To prevent the continued spread of the novel coronavirus through the educational institutions, and to protect children as well as the youth from contracting the virus, governments ordered the closure of all schools. 53 out of the 54 African countries either completely or partially closed their schools. Kenya, Uganda and Nigeria closed all public schools till early 2021. However, other African countries like Ghana and Liberia educational system partially. Institutions at the tertiary level-adopted teaching and learning

online. Some private primary and secondary schools also did the same to complete the term. Other government institutions scheduled re-opening of schools based on the class level to complete the term.

3.1.1 Online Teaching and Learning

Teachers and students used technological tools such as smartphones, tablets, laptops and desktops to access online platforms (Google classroom, Zoom, Microsoft Teams, YouTube, WhatsApp and Skype). The University of Ghana for instance is using Sakai Learning Management Systems for teaching and examining students' performance. Accra Technical University, on the other hand, created a virtual classroom with registered courses and lecturers uploaded learning materials for students. In addition to that, lecturers taught on the Zoom platform. In the University of Development Studies (Ghana), on one of their campuses, (Wa campus) they used WhatsApp for lectures (The universities website, July 2020). In South Africa, during the early stages of the pandemic, some institutions of higher learning like University of Johannesburg, Fort Hare, Wits and Cape Town ceased having direct physical classes and others like Stellenbosch, Rhodes, and Witwatersrand postponed impending graduation ceremonies (Crawford et. al., 2020). Furthermore, the Ministry of Education banned teachers and students from travelling unless it was necessary. Symposia and conferences were constricted and those held used different arrangements to avoid close contact. Whilst the government urged universities in the country to develop diminution plans, measures were taken to evacuate South African students studying abroad (Crawford et al., 2020). South African National Skills Fund supported the South African Broadband Education Networks (SABEN) to provide connectivity to Technical and Vocational Education and Training (TVET) through its Campus Connectivity program (Nyoh, 2020).

According to World Bank Report (2020), Côte D'Ivoire introduced distance learning programs on its online tutoring platform, which accommodated educational resources for nursery, elementary, middle and high school students, arranged by category. It also made provision for technical education and professional training level, all accessible by short message service (SMS). The program was a collaboration between the government and UNICEF with funding from Global Partnership for Education grant of US\$70,000. Ethiopia developed a COVID-19 Education Sector Emergency Response Plan, offering education services via radio broadcasts for primary and digital technology for secondary and tertiary education. Radio courses for primary schools in different regions and TV programs for secondary schools (World Bank Report, 2020). Most African countries took similar initiatives to ensure continuity in teaching and learning.

Other African countries such as Liberia, Ghana, Uganda, Madagascar, and Mauritius also organized lessons of all courses offered at primary, junior and senior high school levels on dedicated radio and television channels for students (World Bank Report, 2020). A tech entrepreneur, Twahir Hussein Kassim sponsored primary schools' teachers in a county in Kenya to acquire digital skills for online teaching (Nyoh, 2020).

However, online teaching and learning brought its own wave of challenges. As Parmar (2017) posited "the integration of mobile technology in classrooms is no longer just a nice-to-have option in teaching and learning. Indeed, it has now become part of the educational process for the 21st century generation." Teachers who were used to the traditional face-to-face teaching have now been asked to teach, deliver course materials, and interact with students online. Educational institutions hold Webinar sessions across the globe (including Africa) to equip teachers with soft skills.

The major hurdles were firstly, how teachers could quickly adjust to incorporating technology into their teaching practices and learning objectives, as well as how students could integrate technology into their learning experience. The cost of bandwidth or internet connectivity was very expensive for an average to poor African and internet coverage in Africa was not comprehensive with poor connectivity challenges. Most towns and communities were not having the telecommunications networks, let alone connect to the internet. Students in such communities found it difficult or could not access online education and may be excluded from the learning process.

Furthermore, there were problems with online assessments. For instance, during assessment, it was difficult to transition from one question to the other and sometimes, the system automatically restarts

by itself, meaning that the student had to start answering the multiple-choice questions all over again. There were ethical concerns too. Without adequate monitoring, students might easily cheat during exams because they have access to their reading materials, lecture notes and older siblings who may be knowledgeable to solve some questions for the student who completes the task by only copying and submission of answers.

Another challenge peculiar to Africa is the erratic supply of electricity. This inadvertently has a direct impact on online teaching and learning since the Internet depends on a constant and reliable supply of power to function effectively.

Some teachers and students were not computer literate, they were trained on how to use digital platforms for instructional purposes. Again, some apps or digital communication channels had no built-in security systems and in a worst-case scenario, intruders usurped the system. Some of the online tools were not user friendly (example, wiki technology) considering the computer literacy level of the user. Meanwhile, some laptops used by students during online studies either had no cameras or the students inadvertently turned off their cameras, making interaction with teachers or professors difficult. Some entrenched old professors complained of not feeling fulfilled after class sessions due to lack of physical contact, which has been the norm for them. Finally, courses like Physical Education, Computer Software and Home Economics are difficult to teach online.

Last but not least, not all students could afford laptops, smartphones, tablets or even buy data to connect to the Internet. These students may be excluded of digital education altogether if positive steps are not taken to ensure they are included.

3.2 The Positive side of the Pandemic

Parents had close long contact with children to understand the hectic nature of classwork and could monitor the activities of the latter.

The COVID-19 pandemic has led to the surge in the usage of information and communication technologies (ICT), which are the drivers of the fourth industrial revolution. Worldwide, teaching and learning have experienced significant change from the conventional classroom style to the present online and melded delivery to prevent the further spread of the virus in educational institutions. Advancements in ICT is a major contributor to this revolution (Isaacs, 2020). He further stated that open and distance learning (ODL), is offering access to education across Africa and even the world at large.

In taking measures to boost access to education, enhance the quality of teacher – student relationship, commitment and learning, educational establishments are progressing from the use of penned, verbal communication, stationary, televised media to collaborative, networked media and technologies (Bates, 2016).

Goh and Sandars (2020), in their study of technology in the field of medicine after the pandemic, emphasized the relevance of the usage of emerging technology to expand teaching and learning across the range of medical education. They argued that technology presents new possibilities for certain categories of students like increasing access, involvement in part-time students and offering shortened courses for brilliant students. According to the World Economic Forum (2020), education technology has highly been accepted and adopted globally with global EdTech (educational initiative) investments reaching US\$18.66 billion in 2019 and the overall market for online education projected to reach \$350 billion by 2025, even before the inception of the coronavirus. However, the utilization of educational technological tools like e-learning, Microsoft Teams, Moodle, Zoom, WhatsApp etc. have increased during this pandemic as mentioned. In addition, several webinar series were held across Africa to share laudable ideas and strategies in effective teaching and learning tools.

In Egypt, some private institutions of higher learning; The British and American Universities in Cairo are using Moodle, Microsoft Class Notes, and Microsoft Teams software, Blackboard, email, and Zoom (Crawford et al., 2020). In Botswana, Botho University offers blended and distance learning programs. This same University offered online methodologies to 25 thousand to government teachers (Botho University website, October 10, 2020). In Ghana, the University of Ghana and other universities had

liaised with telecommunication companies to offer cheap service to their students and lecturers. This allowed both teachers and students easy and affordable access to internet services.

4. Conclusion and Recommendation

As COVID-19 pandemic persists, educational institutions across the world and especially in Africa are required to integrate digital teaching approach, technology and learning management information systems into their educational curricula, which now form important characteristics of the 21st Century educational system. Governments throughout Africa should focus on digital teaching and learning programs to increase the technological literacy level of both teachers and learners. Moreover, like the Chinese educational system, Africa should adopt and use a framework or guideline for open educational resources (OER) and open educational practices (OEP), suitable for the African context to boost teaching and learning experience during and after COVID-19 pandemic (Huang et al., 2020). This, in turn, would help sustain or improve the number of future graduates and teachers who would be technologically sophisticated enough to keep pace with the existing changes and bring Africa in the limelight of the advanced economy.

UNICEF Ghana, for instance, funded Ghana's educational ministry to create a 'COVID-19 Education Sector Response Plan, which is a component of the USD15 million 'Global Partnership for Education (GPE) Accelerated Funds', overseen by the World Bank in aid of the education segment. UNICEF is also helping the educational sector to develop instructional materials to expand teacher capability for curriculum distribution through a radio broadcast, particularly for primary schools (UNICEF, 2020). This could be replicated in most African countries.

²Agricultural University of Tirana, ahoxha@ubt.edu.al

Abstract: The Albanian banking system has undergone an extraordinary transformation after the political and economic changes that took place in the early 1990s. The development and reform of the banking system, especially in transition economies, plays a crucial role in economic development. In addition, existing research has shown that the effectiveness of financial intermediation can significantly impact economic growth Levine (1996).

In recent years, the Albanian banking sector has experienced a remarkable expansion mainly due to the entry of a large number of foreign banks. The banking system is the most important part of the Albanian financial sector, because its assets account for almost 97 percent of the financial sector assets. In Albania, banks act as the main actors in channelling funds from lenders to borrowers, and therefore it is important that their intermediary role is performed at the lowest possible cost in order to achieve higher social welfare. The evolution and control of the banking system thus becomes a problem of interest, especially for a country that is constantly undergoing transformations.

The purpose of this study is to investigate the current situation of the banking system in Albania and in particular to examine the determinants of profitability of commercial banks during the period 2010 - 2020 using the regression analysis panel.

The existing literature divides the determinants of bank profitability into two groups, internal or specific banking factors and external or macroeconomic factors. In addition, the literature uses as a measure of profitability two main indicators, which are return on assets (ROA) and return on equity (ROE).

Furthermore, this study will provide more detailed information about the determinants of Banking profit in Albania, and what will be interesting to investigate is whether the results are differentiated, when the analysis is based only on data from one country, and when it is based on a number of countries with similar economic and political characteristics. The analysis will provide important information for the Albanian banking sector and the relevant policy implications that will follow from the results of the study.

Specific objectives and goals of the study.

This study aims to:

1. Create a historical summary regarding the performance of the banking sector in Albania over the years.
2. Analyse all performance indicators of the Albanian banking system.
3. Investigate and presentation of profitability determinants of the Albanian banking sector.
4. Demonstrate the close link between banking sector efficiency, monetary policy and macroeconomic elements that assist commercial banks in defining strategies for achieving their final objectives.

Research questions.

1. What are the main determinants of bank profitability?
2. To what extent do these determinants affect bank profitability?
3. How is the efficiency situation of the Albanian banking sector?
4. What are the implications for banking management?
5. What are the further improvements that should be suggested for the banking sector based on the discussions on the study findings?

Keywords: Albanian economy, Albanian financial sector, Profitability

Introduction

The Albanian banking system has undergone an extraordinary transformation after the political and economic changes that took place in the early 1990s. The development and reform of the banking

system, especially in transition economies, plays a crucial role in economic development. In addition, existing research has shown that the effectiveness of financial intermediation can significantly impact economic growth Levine (1996).

In recent years, the economy is recovering and the banking sector has experienced a remarkable expansion mainly due to the entry of a large number of foreign banks. The banking system is the most important part of the Albanian financial sector, because its assets account for almost 97 percent of the financial sector assets. In Albania, banks act as key actors in channelling funds from lenders to borrowers, and it is therefore important that their intermediary role be performed at the lowest possible cost in order to achieve higher social welfare. The evolution and control of the banking system thus becomes a problem of interest, especially for a country that is constantly undergoing transformations.

The purpose of this study is to investigate the current situation of the banking system in Albania and in particular to examine the determinants of profitability of commercial banks during the period 2010 - 2020 using the regression analysis panel.

The banking industry is the most important segment of the Albanian financial system and as such, requires greater attention when it comes to its financial analysis. This dissertation deals theoretically and analytically, indicators of return, efficiency and profitability, and for the first time, presents the methodology of calculating a correlation to help determine the efficiency and profitability of the Albanian banking system. The purpose of this paper is not simply to analyse financial or performance reports, but above all suggest some indicators and an index, which can be used by managers and banking supervisors during their work.

Multiple regression in the constructed model has been further used to examine the relationships between variables in terms of the relative importance of the independent variables and the predicted values of the dependent variables (Saunders et al, 2003). For the initial construction of the model a research study was conducted through browsing the available literature to identify potentially accurate components to be placed in the model. Summarizing previous studies, and analysing in detail the Albanian banking system, it was decided to include as explanatory variables in the model, Bank size (logTA), Capital (EA): capital to assets ratio, Credit risk (CR), Liquidity Ratio (LR): Assets Lending Ratio, Inflation Rate (INF), Long-Term Interest Rates (INT).

1. Literature review.

The study is based on secondary quantitative data, which are taken from banks' financial statements and public data of the Banking Association and the Central Bank. Various researchers state that the advantage of using secondary data includes: a) higher quality data compared to primary data collected by the researchers themselves (Stewart and Kamins, 1993); b) a data source that is permanent, more open to public scrutiny, and available in a form that can be relatively easily controlled by others. This increases the reliability of the data used (Denscombe, 1998)

The existing literature presented is categorized according to the places where the studies were conducted. The conclusions of previous research regarding the factors that affect banking profitability are of high importance only for comparison purposes, given that no such studies have been conducted on the Albanian economy and the Albanian banking system in particular. Reflecting the importance of the banking sector in the financial sector and in the economy in general, a voluminous literature has emerged over the last decades in the field of finding determinants of banking profitability. In general, these factors can be divided into two categories: internal and external (Athanasoglou et al, 2006.). Internal factors include the specific factors of each bank, such as the elements that are reported in the financial statements of a bank, as well as factors related to the quality of the bank's management. In contrast, external factors refer to industry-specific indicators, as well as macroeconomic and legal factors of the environment in which the bank operates. The number of explanatory variables varies based on the goals of each study.

However, the most commonly used internal variables are,

- 1) liquidity measure.
- 2) credit risk.
- 3) bank size.
- 4) capital adequacy, etc.,

While external factors include:

- 1) Long-term interest rates.
- 2) Inflation rate.
- 3) Value of gross domestic product (GDP)

As well as industry specific variables such as:

- 1) Ownership structure.
- 2) Measures of concentration within the industry and within the market.
- 3) Size of industry.

Moreover, among the most typical indicators used to express banking profitability are:

- 1) Return on Assets (ROA).
- 2) Return on equity (ROE).

2. Data analysis and research methodology on the determinants of profitability of the Albanian banking sector.

This study will assess the determinants of profitability of the banking sector in Albania for the period 2010-2020. Annual data for this purpose are obtained from the Bank of Albania, the Albanian Banking Association and from the websites of individual banks. The financial statements will be withdrawn from the financial statements of commercial banks during the aforementioned period. Data related to macroeconomic variables are obtained from the Bank of Albania. This study will employ 6 variables.

These include dependent variables:

1. Return on assets (ROA),
2. Return on equity (ROE),

Independent variables:

1. Logarithm of total assets (log AT),
2. Capital ratio on assets (EA),
3. Credit ratio on assets (LR),
4. Provision ratio to total loans (CR).

The hypotheses raised for this study are;

H01 -Total assets will have a positive impact on profitability.

H02 -The growing capital of shareholders has a positive impact on profitability.

H03 -High credit risk will have a negative impact on the profitability of commercial banks.

H04 -High bank liquidity has a positive impact on profitability.

H05 -There is a positive correlation between inflation and bank profitability.

H06 - Long-term interest rates which include inflation expectations have a positive impact on profitability.

2.1 Dependent variables

The two most widely used determinants of a bank's profitability are the ratio: return on assets (ROA) and return on equity (ROE).

ROA shows how effective the bank is in managing its assets.

ROA is calculated as the ratio of pre-tax income to total assets. A disadvantage in using (ROA) as a measure of profitability is that it does not take into account off-balance sheet data thus causing a positive bias towards the bank's valuation.

Return on equity (ROE) indicates the return to shareholders for each unit of monetary capital they have invested. ROE is calculated as the ratio of pre-tax income to total capital. The main disadvantage of ROE is that this ratio will be higher for banks with lower capital levels. These banks will be associated with a higher level of risk due to the high level of leverage. In addition, in many countries the degree of capitalization is established by the monetary authorities. For these reasons the literature refers to ROA as the most appropriate measure of benefit (Golin 2001; Athanasoglou et al 2008).

2.2 Explanatory variables and their expectations.

Explanatory variables that have been used can be divided into two categories:

1. Specific for each Bank (internal), factors related to the characteristics of each bank, such as bank size, capital ratio, liquidity and credit risk ratio and,
2. External factors related to the macroeconomic environment in which banks operate, such as long-term interest rates and inflation.

More specifically, the explanatory variables and their expected effect according to the existing theory and literature are analysed as follows:

1. Bank Size (logTA) (logarithm of total assets): The total assets consisting of the current assets and long-term assets of an entity. For banks, the most important assets are loans because through loans banks generate the highest percentage of their income. In the analysed literature the value of total assets determines the size of a bank. For analytical purposes we use the logarithm of total assets since all other variables are in ratios. It is expected that total assets will have a positive impact on profitability. Studies such as Bourke (1989) and Goddard et al, (2004) show that the effect of size on profitability is positive. However, other researchers suggest that if the size of the bank increases too much, the size effect will be negative since very little expense can be reduced by increasing the size of a bank beyond a certain point (Berger et al 1987. Athanasoglou et al, 2006).
2. Capital (EA): capital to assets ratio (EA) is used as a variable of capital. We expect a positive impact of capital on profitability. The positive impact may be due to the fact that capital refers to the amount of its own funds that the bank could use to support its activities, and therefore capital provides collateral in the event of adverse conditions (Athanasoglou et al., 2006).
3. Credit risk (CR): According to Athanasoglou et al. (2006) the provision ratio to total loans will serve as an indicator of credit risk. According to the theory, high credit risk will have a negative impact on the bank's profitability. This can be further explained by the fact that high accumulation of outstanding loans will bring low income for a bank. Banks, therefore, can improve profitability by using improved credit risk review and monitoring methods.
4. Liquidity ratio (LR): Assets Loans ratio measures the liquidity of bank assets related to bank loans. The higher this ratio the lower the liquidity for a bank. Since interest on loans are the main source of income for a bank we expect a positive ratio in the liquidity variable as more loans show more income.
5. Inflation rate (INF): is one of the variables widely used to capture the effects of the macroeconomic environment. Most studies have found a positive correlation between inflation and bank profitability (Bourke, 1989; Molyneux and Thornton, 1992). However, as Revell (1979) explains, the outcome will depend on whether inflation is projected or unpredictable or whether banks' wages and other operating

expenses grow at a faster rate than inflation or not. Projected inflation means that the bank will have adjusted interest rates in order to increase their income faster than their costs and thus earn higher profits. The opposite results will come if inflation comes suddenly.

6. Long-term interest rates (INT): which include inflation-related expectations are expected to have the same impact as inflation. Both macroeconomic factors will be highly dependent on the maturity of the economy being analysed, so that inflation (and as a result, future interest rates) can be accurately predicted

3. Empirical analysis.

To test the relationship between banking profitability and specific banking variables and those of the macroeconomic environment we have modelled the following form of the linear regression model:

$$\Pi_{it} = c + \sum_{k=1}^K \beta_k X_{itk} + \epsilon_{it}$$

Where Π_{it} is the profitability of the bank i at time t , with $i = 1 \dots N$; $t = 1 \dots T$, c is a constant term and X are the explanatory variables mentioned above.

The general model when we divide the variables into two groups is:

$$\Pi_{it} = c + \sum_{j=1}^J \beta_j X_{itj} + \sum_{l=1}^L \beta_l X_{itl} + \epsilon_{it}$$

Where Π_{it} is the profitability of the bank i at time t , with $i = 1 \dots N$; $t = 1 \dots T$, c is a constant term and X are the explanatory variables grouped into the Bank's specific internal variables (denoted by J) and the specific macroeconomic environment variables (denoted by L).

This analysis will use panel data as it combines time series with cross-sectoral data. The Regress-Panel method is the most widely used method in the literature. In addition, panel analysis provides a very good method for analysing dynamic changes in small time series data samples (Coakley et al. 2008). As a result, a regression panel was considered more appropriate for this study given the small data sample (2010 - 2020).

4. Results of empirical analysis.

This section presents the results achieved by regression analysis. Using the equation and variables we explained earlier, and the models we will examine are as follows:

Model 1: ROA

$$ROA_{jt} = \beta_1 * \log(AT)_{jt} + \beta_2 * EA_{jt} + \beta_3 * CR_{jt} + \beta_4 * LR_{jt} + \beta_5 * INT_t + \beta_6 * INF_t + \epsilon_t$$

Model 2: ROE

$$ROE_{jt} = \beta_1 * \log(AT)_{jt} + \beta_2 * EA_{jt} + \beta_3 * CR_{jt} + \beta_4 * LR_{jt} + \beta_5 * INT_t + \beta_6 * INF_t + \epsilon_t$$

where $ROA(jt)$ is the return on assets for bank j at time t ,

$ROE(jt)$ is the return on equity for bank j at time t ,

$\log(at)_{jt}$, is the size of the bank j at time t ,

$EA(jt)$ is the capital ratio of bank j at time t ,

$CR(jt)$ is the credit risk for bank j at time t ,

$LR(jt)$ is the liquidity ratio of bank j at time t ,

INT_t is the interest rate at time t and

INF_t is the inflation rate at time t,

β_i represent the coefficients of each equation and e_t is the error term.

Table 1: Determinants of bank profitability

Eq.	Prof. Measure	Log(TA)	EA	CR	LR	INT	INF	R2	F
1	ROA	0.020660* (3.804068)	0.083632* (2.288266)	-0.163254 (-3.57523)	0.001800* (1.996453)	-0.007043 (-1.374232)	-0.001800 (-1.996453)	0.780291	3.505048*

Author calculations Note: The numbers in parentheses represent t-statistics *, ** Represent statistical significance at 5% and 10% respectively

As can be seen the estimated coefficients seem to fit the panel very well based on the R2 criterion. In addition, all coefficients are considered to be quite stable between the two alternative models.

In general, the obtained results are in line with our expectations based on economic theory and previous studies.

5. Research findings and interpretations.

Based on the results presented above the coefficient of the size variable is positive and statistically significant in 5 of the evaluated equations (equations 1, 2, 3, 5 and 6) implying that bank size and profitability have positive relationships. In addition, the coefficients for the variable "size" do not change significantly when the benefit measure is ROA (equations 1, 3 and 5) and when this measure is represented by ROE (equations 2 and 6). This result is a testament to economies of scale. This result is expected to weaken further in the future because over time banks will not have the same opportunities to exploit economies of scale.

The coefficient of the variable "capital" (EA) is positive and statistically significant in equations 1, 2 and 5 (in equation 5 at the 10% significance level). The coefficients do not differ significantly between the two alternative profitability measures. This finding is consistent with previous literature findings in SEE countries. (Athanasoglou et al, 2006; Kosak and Cok 2008). This means that the higher the capitalization the greater the benefit and the lower the risk of bankruptcy for a bank. Referring to the Albanian banking system, the larger the bank and the higher the capital adequacy, the greater the effects on the banking profit, as people expect banks to maintain high levels of capital, especially after the crisis of schemes. pyramid in 1997 and that of deposits in 2002. By maintaining the high level of capital of banks in Albania aims to increase public confidence, to reduce the cost of financial inconvenience and stress.

The credit risk variable (CR) coefficient is significantly negative in the five equations (equations 1,2,3,4 and 6). The size of the coefficient does not change significantly when the benefit variables differ from ROA to ROE except in equation 6, where the benefit measure is ROE and the credit risk coefficient is above one. These results are consistent with the findings of Athanasoglou et al. (2006) in a number of SEE countries. As mentioned in this study, banks in Albania and in the region in general need to pay more attention to credit risk management using advanced risk monitoring and forecasting techniques.

The liquidity ratio (LR) coefficient appears to be positive and statistically significant in the four estimated equations (equations 1,2, 3 and 4). In addition, the sizes of the coefficients do not appear to differ significantly between the two models. Thus we can conclude that the liquidity ratio is positively related to profitability. The results are consistent with the findings of Athanasoglou et al. (2006) regarding the coefficient sign however, contrary to our results of this study report statistically insignificant coefficients. As stated earlier, the higher the level of credit the higher the income a bank can generate and thus the higher the profits.

Furthermore, empirical analysis shows that inflation is negatively related to bank profitability. More specifically, the coefficient on inflation is negative and statistically significant in equations 1,2,3 and 4. Again, the magnitudes of the coefficients do not differ significantly between different profit measures. This contradicts the results of previous studies like Athanasoglou et al. (2006) which report very significant positive inflation coefficient. As explained above, this can be seen as a failure of the Albanian banking system to make an accurate inflation forecast.

Finally, as expected, the analysis reports a negative interest rate coefficient. However, the interest rate coefficient seems to be significant only in equation 3.

Socio-Psychological Dimensions of Obedience and Subordination in Organizations

Emil Kotsev¹

¹University of Ruse, ekotsev@uni-ruse.bg, ORCID: 0000-0001-6848-3051

Abstract: The paper studies obedience and subordination in the organization as independent socio-psychological categories. The aim is to distinguish them from compliance and conformity, to discuss different approaches to their interpretation, and to suggest clear guidance for future research. Using the content analysis method, two forms of obedience are defined and explored – formal and informal. Basic characteristics of formal obedience are identified: sociality, hierarchy, determinism, and targetability. Each of them is analyzed in terms of individual and organizational context. Informal obedience peculiarities are also discussed and the term "obedience threshold" is defined. In informal obedience, it is determined by social attitudes and readiness of both parties in the leader-follower relationship (specific for each situation), while in formal obedience the threshold depends mainly on the resources (financial, human, material and information) available to each of the sides. Subordination as a separate category is defined as a dynamic process of interaction in which a member or members of the organization change their behavior in an organizational context as a result of formal authority exercised by a superior in the hierarchy. On this basis, the peculiarities of organizational subordination are discussed. It is concluded that subordination is a special kind of obedience in which informal elements are missing. Subordination is always formal, unlike obedience, which can also be informal.

Keywords: Obedience, subordination, formal and informal authority.

1. INTRODUCTION

The attention that social psychology has paid to issues of power in recent decades naturally leads researchers' interest to the problems of obedience and subordination. Their relative neglect at the expense of power and leadership does not call into question their significance. Specialists have long perceived power and subordination as interdependent elements of a whole. As early as the end of the 19th century, Simmel (1896) considered superiority and subordination as a subject of sociology, and a hundred years later the interest in the relationship between the varieties of these categories (authority, leadership, supremacy, obedience, followership, etc.) did not decrease (Zimbardo, 1974; Baird & Kram, 1983; Hamilton & Biggart, 1985; Elangovan & Xie, 1999). Theories that try to explain the mutual influence between the subjects of power and subordination naturally appear. One of the concepts that summarizes the views of experts in the beginning is the vertical dyad linkage theory (Dansereau et al., 1975). Later, the ideas embedded in it evolved and became the basis of the leader-member exchange theory (Dienesch. & Liden, 1986), which subsequently gained widespread popularity (Graen & Uhl-Bien, 1995; Liden et al., 1997).

The presence of a connection between leadership and subordination is unconditional. But in order to reveal the specifics of each category, it is necessary to consider it independently. With greater or lesser success, attempts to study obedience and subordination have been made (Milgram, 1963; Milgram 1974; Meeus & Raaijmakers, 1995), but most of them have received critical comments from other researchers (Baumrind, 1964; Miller et al., 1995). Over the last decade, experts' interest in obedience and subordination seems to be reviving. Some of them consider the mutual exchange between the subjects of power and subordination within the organization (Schyns & Day, 2010; Jiang, 2019; Wang & Ye, 2014). Others focus on changes in subordinate behavior (Arbaiza & Guillen, 2016; Albrecht & Andreetta, 2011; Yelamanchili, 2018) and their impact on organizational performance (Idowu et al., 2017; Schaubroeck et al., 2017). All of them have their indisputable contribution to a better understanding of the human factor influence on organizational results. But a common weakness in most studies is the insufficient correctness of terminology. There is often no clear semantic distinction between obedience and subordination in an organizational context, and terms such as employee, subordinate, follower, and worker are used to describe identical subjects. This complicates their objective study and calls into question the conclusions reached by researchers.

The aim of this paper is to present an alternative understanding of obedience and subordination in organizations and thus to distinguish them from other similar categories, to discuss different approaches to their interpretation, and to suggest clear guidance for future research.

2. APPROACHES TO INTERPRETING OBEDIENCE

At first glance, the study of obedience should not be a particular problem – it is all around us and in each of us. From the earliest years, people get used to obeying. As Zimbardo (1974, p.66) correctly points out, the main lesson taught in education systems is the need to obey trivial, inappropriate rules and to follow protocol, while respecting authority because of its existence. Other authors are even more extreme in their analysis, defending the thesis that obedience becomes an unconditional operational norm in countless organizations and institutions, many of which are endowed with extremely high cultural status – such as the army, hospitals, etc. (Miller et al., 1995, p.11). Thus, the conclusion is that the discovery of an object of study should not be a problem in a world that has perceived obedience as a norm of behavior.

However, two additional factors make the study of obedience as a separate category a difficult task. First, it is hampered by the close association of obedience as a social process with compliance and conformity – sometimes distinguishing the three forms of social influence in practice is almost impossible. Generally, compliance involves an adaptation of one's actions to another's wishes or rules, while conformity describes a change in attitudes and behavior due to unshared but implied intentions of people we care about (no need to agree with them, only to trust them).

Second, the question arises as to whether it is ethical to conduct studies of obedience if they require the issuance of orders that are unacceptable to participants in the experiment. A question that does not have an unambiguous answer, as evidenced by the many scientific debates on this topic. The discussion between Milgram and Baumrind, which erupted in the mid-1960s from the pages of some scientific journals, seems to be a textbook example in this regard (Milgram, 1963; Baumrind, 1964; Milgram, 1964).

In general, obedience can be observed when the individual changes his or her behavior in order to carry out the direct orders of legitimate authority. In other words, the will and desire of one are transformed into the actions of another (in contrast to conformity, where the object adopts the will and desire of the subject). Obedience is the act of following orders without question (in contrast to compliance, where rational persuasion or inspiration is involved). A balance between obedience and noncompliance is often needed (Martin, 2013, p.106)

From this point of view, at least two approaches to interpreting obedience can be distinguished.

By the first, obedience is seen as *a characteristic of the implementation role*. In this sense, it derives from the place occupied by the individual in the organizational structure. Each position in the management hierarchy has certain tasks to perform. Usually, a higher position is associated with the ability to perform activities that are characterized by more versatility, creativity, and diversity. The lower in the hierarchy the respective position is, the more specialized, routine, and homogeneous the activity of the doer becomes. Irrespective of whether the peculiarities of the assigned task correspond to the personal preferences of the individual, the superior can make it happen by exercising her formal power to demand from the subordinate the execution of the order. The change in the behavior of the object of influence as a result of the use of formal power could be defined as *formal obedience*. It could be characterized by the following characteristics:

- Sociality;

Formal obedience is a particular form of social connectivity in which some organizational members are in dominant-submissive positions with each other. Generally, it has relative stability and involves organizational members from different, yet adjacent management levels. Structurally, it can be considered as a relationship between two subjects (individual or collective), one of which is the contracting authority and the other – the executor of a particular task. The communication between the

two parties does not have to be one-way, but for information exchange mainly preliminary regulated communication channels are used.

- Hierarchy;

Formal obedience is a hierarchical relationship based on the subordination of the subjects involved. The different positions in the organizational structure are vertically connected in stages, which predetermines the different obedience degrees of the object of influence.

- Determinism;

Formal obedience is determined by the organizational structure. This means that it is not determined by the personalities of the leader and the subordinate, but by the positions they hold. In this aspect, it is not influenced by the dynamics of career growth – in exceptional circumstances or for a sufficiently long period of time, the roles can change and the former subordinate can become superior to his former mentor. But the subordination of one structural-organizational post to another will be preserved, together with the obedience of those occupying it at a given moment. In this sense, the superior-subordinate relations are clearly and precisely constructed.

- Targetability;

As a result of the formal obedience in the organization, targeted actions are performed to maintain or expand its economic activity. The tasks that the members of the organization perform derive from the goals and targets set in the strategic, tactical, and operational organizational plans.

The work of each subordinate is evaluated depending on the extent of goal achievement. This assessment can be highly motivating or demotivating, unlike the individual's self-esteem. According to Vichev (1996, p.97), self-esteem could be defined as "the tendency of the ego to be enriched with a certain value and to seek recognition of that value". In formal obedience relations, self-esteem doesn't count. Organizational members obey mostly to receive a higher grade from the bearer/subject of power, and not to enrich themselves with a specific value.

According to the second approach, obedience is perceived as *a characteristic of the personality*. It is a relatively voluntary form of behavior chosen by the individual, which does not depend on the position held in the organizational structure. It is determined by personal qualities and the desire to follow the instructions of the chosen leader. The voluntary nature of the "leader-follower" relationship is determined by its informal nature. The change (as well as the readiness for change) in the behavior of the individual as a result of the use of informal authority could be called *informal obedience*.

Informal obedience can be seen as a relation of voluntary dependence. Accepting the superiority of another individual, the subject of obedience puts himself/herself in a one-sided dependent position with the leader. This action can be explained by the personality's need for affiliation, which some authors consider to be fundamental, along with the needs for achievement and power (McClelland, 1961). It encourages the individual to seek recognition of his own worth through the successful execution of other people's orders. The leader's assessment is important, but when obedience is seen as a personality characteristic, the follower's self-esteem is decisive. For example, if the leader's behavior reflects some doubt about the value of the follower (which is not shared by the follower herself), a refusal to carry out orders is possible. In case of frequent discrepancies in the leader's and follower's appraisals, the subject of informal obedience may decide to break the relationship of dependence. This stems from people's tendency to value their self-esteem and is "something like an innate sense of justice" (Vichev, 1996, p.97). It contradicts the need for affiliation and is the cause of the internal dichotomy in the individual. An innate sense of justice can lead to a reassessment of an existing relationship and redirect the individual to another object of interaction.

Followers can make a similar decision if their subjective perception of the scope of the leader's power does not correspond to her perception of the limits of influence on them. Such circumstances lead to the conclusion that there is a threshold of obedience, after which the individual ceases to obey.

Milgram's research on the limits of human obedience is remarkable for its depth (Milgram, 1963). Although some aspects of his methodology have been criticized (Baumrind, 1964), his research is seen

by many authors as a "classic contribution to social psychology" (Moscovici, 1998). Analyzing the conditions under which people obey authority, he considers two mental states – autonomy and agent. In a state of autonomy, the subject feels responsible for her actions and her own value system guides her behavior. When a person perceives himself as an agent, she loses her individuality and feels part of a hierarchical structure in which another person (the authority) is responsible for her actions and directs her activity. Milgram's contribution is not only that he identifies the factors that help an individual move from one mental state to another. Much more serious is the conclusion he draws about the relative influence of external and internal factors on obedience. According to him, people tend to underestimate the role of external (social pressure, distance in space) and overestimate the importance of internal factors (personality, value system). Thus, the conclusion is formed that the obedience threshold of one and the same individual is not a constant, but a variable that varies depending on the operation of certain situational factors.

The obedience threshold is a characteristic of both informal and formal obedience. In informal obedience, it is determined by the social attitude of both parties in the leader-follower relationship for each specific situation. Andreeva (1983) defines the attitude as an overall dynamic state of the subject, a state of readiness for a certain activity, a state that is determined by two factors: the need of the subject and the corresponding objective situation. Frequent changes in attitudes increase the likelihood that a follower's behavior will not correspond to the leader's expectations. In such cases, the obedience threshold becomes unstable and the relationship between both parties is uncertain.

In formal obedience situations, the obedience threshold mainly depends on the resources (financial, human, material, and information) available to superiors and subordinates. With insignificant differences in resources, the possibilities for the bearer/subject of authority to influence the subordinate are very limited. The executor has relatively greater freedom to deny the authority, respectively the order. In such cases, a low obedience threshold is observed. Where differences in the quantity and quality of available resources are significant, having the power to allocate them, the superior may raise the obedience threshold by extending the scope of tasks assigned to the subordinate.

3. ORGANIZATIONAL FOUNDATIONS OF SUBORDINATION

There is no sign of equality between the categories of *obedience* and *subordination*. However, careful analysis requires their differentiation. A brief review of the research on the problem shows that there is still much to be desired to refine the meaning given by specialists of the term *subordination*. It derives from the Latin words *sub* (under) and *ordinatio* (arrangement) and is most often associated with "the placement in a lower class, rank, or position: the act or process of subordinating someone or something or the state of being subordinated" (Merriam-Webster Dictionary). Obviously, this definition brings subordination and formal obedience closer together, but it is too crude and general for any serious analyst.

Without contradicting the above, in this paper the following definition is suggested:

Subordination in the organization is a dynamic process of interaction in which a member or members of the organization change their behavior in an organizational context as a result of formal authority exercised by their immediate supervisor.

Several points need a close look in this definition:

- Subordination is a *dynamic process* that is influenced by the nature of the task to be performed, the characteristics of the organization or group, and the individual features of its members. Or, like in the situational leadership theory where there is no single best style, there is no best way to be a subordinate, either. Each employee must be able to choose and apply such behavior that contributes to the highest degree of organizational efficiency.
- Subordination is a process of *interaction*, as it involves a bilateral exchange of information and joint achievement of common (group or organizational) goals. In this sense, it is not a process of unilateral influence, as is commonly perceived.

- In subordination, the change in the individual behavior in *an organizational context* is important. In other words, any interaction between members of the organization on matters not related to its activities should be considered as a personal choice and not as a form of organizational (formal or informal) obedience.
- The change of behavior in subordination is due to the *exercise of formal authority*. In a formal group, such as a production department, it is normal for the goals and specific tasks to be set by the head of the department. Subordination requires subordinates to follow instructions, and thus the organizational management is settled. Unlike formal obedience, in which all orders of the formal authority are followed, subordination concerns only issues directly related to organizational activities.
- The role of formal authority in subordination is always exercised by the *immediate supervisor*. This is the other difference from formal obedience – in it, the number of hierarchical levels between the interacting parties does not matter. For example, the CEO of a company may require formal obedience from all staff, while subordination reflects only the interaction with her immediate/direct subordinates.

Based on the above, it can be assumed that subordination is *a specific kind of obedience in which there are no informal elements*. Subordination is always formal, unlike obedience, which can also be informal.

Historically, there have always been contradictions and tensions between superiors and subordinates. Robert Sieger, an employment expert and professor of history at the University of Florida, explains this antagonism by saying that these are relationships based solely on strength (Weinstein, 1998). He traces their development over the last hundred years and concludes that the barrier separating superiors and subordinates, the barrier that keeps them on a constant fight, has not been removed and will never be removed.

The development of the theory and practice of organizational behavior and human resource management in recent decades does not confirm this categorical (at first glance) opinion. Efforts are aimed at improving the quality of working life of employees at all levels and their inclusion in the decision-making process. The leading companies purposefully follow principles for diversification of work, for building and maintaining mutual trust, for equal treatment and empathy. The teamwork principle is already recognized in societies with a pronounced tendency towards individualism (such as the Bulgarian one).

When analyzing the subordination in modern organizations, it is useful to consider several conceptual categories – delegation, chain of command, and span of control.

As is well known, *delegation* is the process of assigning authority and distributing work from superiors to subordinates who take responsibility to carry out specific activities. This is done to increase the total volume of work done. The superior assigns to subordinates the responsibility for performing a certain job, transferring to them the necessary authority. In turn, the subordinate is responsible to the superior for the successful completion of the task.

Some authors consider delegation as a form of higher trust and recognition of the qualities and capabilities of subordinates, which creates strong moral incentives for higher proactivity and creativity in work (Kanchev, 1986, p.98). However, this statement is quite debatable, as not all subordinates willingly accept delegated authority and corresponding responsibilities. Many of them show indifference, lack of motivation, and (most of all) fear of accepting additional power. Some of the reasons for the subordinates' concerns are related to the changes in the dyad decision-making process. According to Liden and Graen (1980, p.453), dyadic decision-making involves a manager and subordinate working together to reach a decision. In the general case, the decision is made by a democratic process in which alternatives are discussed, accepted, or rejected. The discussion process shares the power between the two parties in a certain ratio. Delegation changes this relationship. Although through it the subordinate acquires a certain autonomy, power is no longer shared. Benjamin Schneider (1986 as cited in Pringle et al., 1988, p.214) notes that the manager, alone, determines what decisions the manager will make and which ones will be delegated to the subordinate. Previously

existed social relationship between manager and subordinate is altered. The effect of delegation in the new situation is that subordinates can no longer be "just one of the group" (Leana, 1986, p.760). The feeling of satisfaction from being part of a group disappears.

Another concept directly related to delegation is *chain of command*. As a formal channel predetermining the authority, responsibility, and communication in the organization, it can be considered as an "infrastructure" of subordination. Under normal circumstances, each organizational member must comply with the defined chain of command, accepting and executing orders of no more than one superior (principle of unity of command).

In practice, however, strict adherence to this principle is impossible. In most organizations, there is a certain flexibility of the chain of command, which can be explained by the influence of certain forces on organizational performance. For example, the requirements for accuracy and speed of communication support a more "plastic" chain of command. A similar situation is observed when a need to bypass the chain in exceptional circumstances occurs. Sometimes in such cases, it is useful for subordinates to be able to make direct contact with different superiors without using official channels (of course, with circumstances approved in advance by the immediate superiors allowing such "crossings").

Among the main issues affecting subordination is the problem of the *span of control*. Some experts call it "norm of controllability" (Mishin, 2006). The number of direct subordinates of a leader has been the subject of scientific debates for most of the past century. Among the proposed concepts, the Graicunas' formula is particularly original (but also highly criticized), according to which managerial activity increases in a geometric progression, and the number of immediate subordinates in an arithmetic one. So far, however, there is no objectively proven formula for finding the optimal span of control for each management level. Only adherence to some basic principles can help managers in practice to some extent:

- The more routine the tasks to be performed in a particular unit (department), the wider the scope of control can be.
- The closer the individual operations and activities are performed in space, the wider the span of control can be.
- The fewer non-managerial responsibilities assigned to the manager, the wider her span of control can be.
- The more similar the positions that are subject to management, the wider the span of control can be.
- The more competent the manager and her subordinates, the wider the span of control can be.

In addition to competence, there are other factors related to subordinates that affect the span of control in each case. For example, the more of the so-called "difficult" subordinates there are in a team, the more clear will be the need to reduce the number of team members. Depending on the nature of the problems, difficult employees in organizations can be categorized as follows:

Category 1. Employees whose work is unsatisfactory in terms of quality and quantity due to insufficient training, skills, or motivation.

Category 2. Employees who leave personal problems to affect their performance. These problems include alcoholism, drug addiction, family relationships.

Category 3. Employees who violate the law by their behavior in the organization. Examples of culpable conduct include misappropriation of property (organizational or other members'), abuse of colleagues, etc.

Category 4. Employees who systematically violate company rules and do not adequately respond to the reactions of superiors.

For each of these categories, specialists offer specific management methods, but they are not the subject of this study. It is more important to note that the ideas presented in this paper refer to

subordinates who do not fall into the above categorization. They are intended and can be useful only to employees who, firstly, accept Drucker's thesis (1985, p.166) that the executive owes effectiveness to the organization in which he works and secondly, have the ability and sincerely want to increase their own efficiency in following and achieving organizational goals.

4. CONCLUSION

As a result of the above considerations, several conclusions can be drawn:

First, at least two approaches can be used to objectively interpret subordination – as a characteristic of the executive role and as a characteristic of the personality. Depending on the approach used, we can distinguish formal from informal subordination. There is an obedience threshold that limits the influence of the superior. It is concluded that the obedience threshold of one and the same individual is not a constant, but a variable that varies depending on the action of certain situational factors.

Second, subordination in organizations is a specific type of obedience, which can be defined as a dynamic process of interaction in which a member or members of the organization change their behavior in an organizational context as a result of formal authority exercised by their immediate supervisor. The successful flow of this process needs to take into account the influence of basic organizational mechanisms such as delegation, chain of command, and the span of control

Third, the above considerations point to the main conclusion in this report, namely that to achieve organizational goals, subordinates must realize their key role in the dyad linkage with the superior. As a direction for future research, the internal and external sources of subordinates' influence on the immediate supervisor would be of interest, as well as the specific situational factors on which the style of subordinates depends. Considering them not only as objects but also as subjects of influence in the organization could highlight some not quite clear aspects of employees' work. A particularly favorable object for research could be the middle manager, whose position in the organizational hierarchy presupposes the presence of an immediate superior and direct subordinates. Studying the different combinations of leadership and subordination styles in these three levels can reveal additional opportunities to improve organizational effectiveness.

Tourists Perceptions Towards Destination Attractions Case Study Korca Region

Assoc.Prof.Dr Esmeralda Shkira¹

Msc.Gerda Kreshova²

¹shkiraesmeralda@yahoo.com

²gfundo2004@yahoo.com

Abstract: The tourism industry is one of the fastest growing industries in the world, as a result many new destinations are being created not only in developed countries but also in developing countries. The increase of the number of tourist destinations all over the world, development of information of technology and the spread of internet worldwide has created a strong global competition between tourist destinations. To face this competition, tourist destinations are creating competitive advantages focused on the diversification of tourist attractions, the creation of unique attractions and a positive image. The image of a tourist destination is an important element in choosing a travel destination, which is created not only by the quality of the products, services and attractions but also by tourists' perceptions. This study develops a research framework based on measuring tourists' perceptions about the attractions of a destination. The methodology of this study is focused on empirical data, data collected through surveillance and observation of touristic areas in the Korça region, and also there is conducted a comparative analysis between the areas to compare the image level with the attractiveness level.

Key words: tourism industry, tourist destinations, attractions, tourists' perceptions

1. INTRODUCTION

Tourism before the '90s was vital for many countries that offered natural and cultural attractions but today it is becoming an important factor in supporting the economy of many countries which although do not offer powerful attractions created by nature have created attractions and are developing alternative forms of tourism to attract tourist flows. The growing role of tourism in the economy of different countries was confirmed once again today where the economy of all countries were hit hard by the pandemic (Covid '19) and are easing the restrictive rules for the movement of people to give a breath to tourism and put in motion the gears of economy. Competition to attract the attention of tourists has pitted destinations around the world, orienting them towards product diversification, quality improvement and the creation of multiple forms of communication, the essence of which is the projection of an identity through image. Also in a strong competition are tourism businesses which are relying on creating better relationships with customers, creating customer satisfaction to increase positive perceptions. In a competitive tourism business, customer satisfaction is seen as the main differentiator and increasingly becomes the key element of business strategy (Kotler et al., 2010). According to Lamb et al. (2014), perception is the processes by which people select, organize, and interpret stimuli into a meaningful and coherent picture. So all the destinations are focused in researches for finding the best ways to which customers will create good perceptions, get satisfied and spread a good image. It is very important to understand how tourists process and destination image perceptions are created because these images and perceptions play a key role in tourists' destination-decision-making processes. As we know tourism products can not be tasted and the destination can not be experienced before, so decision making is largely based on information through internet and the feelings and emotions tourists associate with each destination (Dias, F.; Cardoso, L. (2017), Tavares, J.M.; Tran, X.; Pennington-Grey, L. (2020). Also there are other variables that affect within the process—e.g., costs, distance of regions, attitudes, knowledge, technology, and trust—are equivalent among the available alternatives Stern, P. (2000), Paunović, I.; Jovanović, V. 2019. Nowadays when destinations offer the same standard of these variables the success of a destination lies in the ability to offer experiences that exceed tourists' expectations Jetter, L.G.; Chen, R.J. 2011. It is very important to understand tourists' perceptions in the current digital-oriented world, and where reservations are almost online (Fernández-Gómez, M.A.; Bendodo-Benasayag, B.; Sánchez-Serrano, J.R.; Pestana, M.H, 2020). Lin and Huang 2009, said that tourists describe destinations where they had positive experiences with attributes related to sensorial experiences. According to Huang & Sarigöllü (2008) the core and secondary factors of the destination affect the tourists' satisfaction. The core factors are the fun & sun, ecotourism, outdoor adventure, sea sport and entertainment. The destination attributes affect the

perceived quality of tourist offerings and those factors are positively related to the tourists satisfaction and their behavioral intentions also confirmed that there is a positive relationship between the tourists' satisfaction and the behavioral intentions (Zabkar et al., 2010).Thompson & Schofield (2007) identify factors related to the public transport system of the destination i.e. ease of use, efficiency and safety, and good parking affect for the tourists satisfaction.

2.TOURISM AND ATTRACTIONS OF KORÇA REGION

Tourism in this region is focused in some important villages and often frequented by tourists. Korça region offers three natural parks and lakes. In addition to the mountain climate, dense pine and fir forests, and the presence of an impressive landscape, tourists can find parts of the history and heritage of the Albanian people starting from the period of Byzantine rule. Korça offers many cultural activities, festivals and fairs that would make your stay in this city even more enjoyable.Events like Easter, Christmas, Carnivals or The Beer Festival are also very interesting, marking the largest number of visitors in the city. National Museum of Medieval Art, Archaeological Museum, John Mili Museum of Photography, National Museum of Education, Bratko Museum, Old Bazaar, Cathedral of the Resurrection of Christ. One of the villages, Voskopoja has a considerable number of Orthodox churches and monasteries belonging to this period. During the winter offer ski slopes for the visitors. Another attractive place is Selca, there are five ancient monumental tombs dating from the IV century, which are part of the ancient colony of Pelion where the Illyrian king Klit, lived. Objects dating back to the Bronze Age around the middle of the 6th century, including Ionic treasures, bronze and ceramic objects, weapons and gold items. Golik Bridge crosses the Shkumbin River and dates from the 17th century. This bridge has an old stone structure and is part of the Egnatia road near the village of Golik.

Kolonjais another interesting place,it has many natural resources such as the coal resources of Bezhan, the thermal springs with curative values of Vromoner, Sarandopor, the unstudied sulfur gases of Postenan. The town of Leskovik is mentioned in written documents from the 15th century. In the center of the city there is a great 300 year old tree.

Devolli, a country with precious natural and social resources. Offering rare and well-known historical values, such as the Tren cave and the Trojan castle, it is known as one of the earliest settlements of the Albanian ancestors, the Illyrians. Around this cultural monument, there are several other monuments such as Trajan Castle, Moku Wall, Ventrok Castle, Spile Cave, Gradishta e Shuecit and other mounds near it, which constitute an archeological site Pelioni.

Korça is famous for its traditional cooking and delicious dishes. The famous “byrek” or “lakror në saç” should be mentioned, also the cooking of Karp fish which is found in Lake Prespa,or the tasty ‘cironka’ as well as the cooking of red meat with a wonderful taste. The characteristic dishes of Korça are: ‘petanik’made with beans, ‘lakror’, ‘përvëlak’, ‘lakror’ made with milk and let’s not forget about ‘kërncka’, etc. Vithkuqi is famous for its nuts and green tea, for roasted meat and dairy. You can try and taste pears, snails, countryside mushrooms and ‘lakror’ with corn flour. Korça,is the country that offered the first beer in Albania.

3. RESULTS ABOUT TOURISTS' PERCEPTIONS OF THE KORÇA REGION

ATTRACTIONS

This study was conducted on the basis of a survey conducted with 72 domestic and foreign tourists. The survey was conducted through a questionnaire designed to find out how tourists feel about the attractions offered by the Korça region. The total number of correspondents in this study was 72, of which 42 are local (58.3%), 6 are American tourists (8.33%), 5 French tourists (6.94%), 5 Italian tourists (6.945%), 3 Chinese tourists (4.167%), 4 Dutch tourists (5.556%), 4 German tourists (5.556%) and (4.167%) 3 Turkish tourists. Reasons to visit 45% recreation, 12% visits to friends, education 21%, business 3%, other reasons 19%. We also note that the importance that tourists give to the attributes of the Korça Region is influenced by the nature of the purpose of an individual's trip. Asked about the

reason for their visit to Korça (Recreation, vacation, sports / business / education / visit to friends / others), almost a half of the tourists asked, gave as a reason for their visit to Korça "Recreation , holidays, sports "(45.84% n = 33); 12.5% of them (n = 9), had come to Korça for a "Visit to friends"; 20.83% n = 15 education while 18.06% of tourists (n = 13) gave different reasons such as climate and natural beauty that Korca offers, while only two tourists (2.778% n = 2) gave as reason "Business". Gender 37.5% n = 27 females and 62.5% = 45 males. Age 15-24 (5.56% n = 4), 25-34 (16.67%, n = 12); 35-44 (25% n = 18), 45-44 (27.8% n = 20), 55-64 (16.6% n = 12), over 64 years (8.34% n = 6). This study also explores what motivates tourists in choosing Korça as their holiday destination. 63.9% of survey respondents wanted to experience a culture different from their own and 36.1% of those who wanted emotions and experiences.

Nearly 26.4% of tourists talked after their experience on the way back. Tourists who come on vacation, value accommodation more, those who come for business value natural factors more (natural beauty, water, outdoor activities), tourists who follow health value medicine / health services; those who come for educational purposes consider the most important energy / water supply, sewerage, services (4.73%); those who come to visit friends value transportation and services as the most important, while others value natural beauties. The assessment given to natural factors is 41.7% very attractive; 36.1% extremely attractive and 1.4% quite attractive. Cultural factors 41.7% of tourists rated it as extremely attractive; 30.6% very attractive, 25% attractive and 2.8% quite attractive. Commercial and recreational facilities are rated 2.8% extremely attractive; 43.1% attractive; 30.6% quite attractive; 18.1% very attractive; 5.6% not attractive. Accessibility in the region is rated on average. Services are rated on average. In terms of cost and prices tourists have rated below average.

According to the perceptions of tourists, natural beauties occupy an extremely important place. Architectural and artistic characteristics occupy an important part being valued at 49.3%; extremely very important with 28%; very important with 15.3% and slightly important with 26.4%. Historical and ancient ruins are estimated as important with 29.2%; slightly significant by 22.2%; extremely very important with 26.4% and very important with 22.2% .. Carnivals and festivals as one of the activities that Korça is visited, is assessed as extremely very important with 23.6%; very important with 47.2%; important with 23.6% and slightly important with 5.6% .. Local distinctive features were assessed as extremely important with 29.2%; very important with 13.8%; significant by 20.8%; slightly important with 23.1% and not at all important with 13.1% .. Religion occupies a not at all important% with 45.8%; very important with 16.7%; important 6.9% and slightly important with 30.6% .Food attribute that is rated as extremely very important with 75%; very important with 18%; important with 2.8%; not at all important with 4.2% .Outdoor activities are extremely very good occupying 38.9%; 20.8% good and very good 40.3% .Objects that follow health extremely much significant with 43.1% very good 38.9%; good with 12.5% and a little good with 5.5%. Information centers, interpreting and language services are rated with 27.8%; 19.4% very good; 41.7% good and 11.1% a little good. Community attitudes towards tourists occupy 18.1% as extremely very important; 36.2% very important; 31.9% important; 6.9% little important and not at all important 6.9%. When asked how much they intend to visit Korça again in the future, 87.5% of the tourists who participated in our study expressed themselves positively. By studying in more detail the perception that tourists have of the attractions of the Korça Region and from the answers received we notice that they generally appreciate more natural and cultural factors (averages 4.13 and 4.11 respectively) and less recreational commercial facilities and infrastructure (m = 2.82 and m = 2.79 respectively.) However we note that tourists residing in different countries of origin differ significantly in their perceptions of the overall attraction of a tourist destination. Suffice it to refer to the second table and note that Albanian tourists value natural factors more (m = 4.21, std = 0.982); Italians value services more (m = 4.20, std = 0.847); the Chinese value cultural factors more (m = 4.89, std = 0.943); the French (m = 3.50, std = 0.871) and the Germans (m = 4.00, std = 0.856) value cultural factors more, while the Turks value natural factors (m = 4.71 std = 0.985). So we found that tourists value as more attributes important 'natural factors' and 'cultural characteristics', while less other elements such as superstructure (recreational and commercial facilities), infrastructure and reception, services, cost / price.

Another important factor that affects the perceived importance of the attributes of the Korça Region is the connections with the income of tourists. The majority of tourists participating in the study (34.72%,

n = 25) are with their annual family income below \$ 20,000; 31.94% of them (n = 23), with annual income of \$ 60,000 - \$ 80,000 (13.88%, n = 10); 19.44% of tourists (n = 14) with \$ 20,000- \$ 60,000. From the results of the questionnaire it was noticed that tourists with incomes below \$ 20,000, consider food as the most important (m = 4.92); those with incomes of \$ 20,001- \$ 40,000 energy / water supply and sewerage services (m = 4.78); tourists with income \$ 40 001 - \$ 60 000 energy supply / water sewerage services, medicine / health services, natural beauties (m = 4.58); and those with incomes of \$ 60001- \$ 8000 rate cultural attractions and services as the most important (m = 4.70).

In contest of proving how important is the relationship between tourist perceptions, image and origin of tourists some hypotheses have been put forward.

Hypotheses

Hypothesis 1: Tourists residing in different countries of origin differ significantly in their perceptions of the overall attraction of a tourist destination.

Hypothesis 2: There is a stronger perceived importance of destination attributes among foreign tourists in certain primary tourism products such as "Natural Factors", and Korca 'Cultural Characteristics', while western visitors will give more importance to secondary tourism products such as 'Recreation and Shopping Facilities,' 'Infrastructure,' 'Access,' 'Reception,' 'Services', and 'Cost / Price'.

Hypothesis 3: The highest perceived overall attractiveness of the destination will be positively related to the likelihood of reviewing the destination.

H 1: Tourists residing in different countries of origin differ significantly in their perceptions of the overall attraction of a tourist destination.(Table1,2)

Table 1:General Attraction * Citizenship Crosstabulation \

Count		Albani an	Italia n	Chine se	Fren ch	Americ an	Dut ch	Gjerm an	Turki sh	
Gener al Attracti on	Attracti ve enough	2	0	0	0	0	0	0	0	2
	Attracti ve	19	1	0	2	3	2	3	0	30
	Very attracti ve	18	3	2	3	2	2	1	2	33
	Extrem ely attracti ve	3	1	1	0	1	0	0	1	7
Total		42	5	3	5	6	4	4	3	72

Table 2:Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	13.376 ^a	21	.008
Likelihood Ratio	16.274	21	.754
Linear-by-Linear Association	.571	1	.450
N of Valid Cases	72		

a. 30 cells (93.8%) have expected count less than 5. The minimum expected count is .08.

While $\chi^2(21) = 13.376$, $p = .008$, we say that tourists coming from different countries have different opinions about the general attraction of Korça.

H 2: There is a stronger perceived importance of destination attributes among foreign tourists in certain tourism products, such as "Natural Factors", and 'Cultural Features' of Korca, while western visitors will give 'Objective' 'Access,' 'Reception,' 'Services', and' Cost / Price '(table 3,4)

Table 3:Perceptions of tourists on tourist attractions of Korca region/Crosstabulation

4.CONCLUSIONS

When you visit a destination you get a combination of experiences, some components may have more impact on tourist ratings than others. Based on this study we identified tourists' perceptions of destination attractiveness and the importance of destination attributes related to travel purpose, socio-demographic characteristics, such as age, gender, educational level, occupation, income, marital status and family size. The results of the study in these areas show that: (1) 80% of visitors seem to repeat their visit, (2) destination attributes are important, and (3) some demographic characteristics are important for market segmentation. As a result we can say that:

-Specific marketing strategies should be focused on reminding and informing. People who have visited the area before are presumed to have had a favorable holiday experience and are therefore likely to return.

- Korça can generate income from tourism by attracting visitors that tend to return.

-Creating advantages of this key tourism segment, pushes businesses to create communication tools that remind individuals of their experiences in Korca.

'Cultural features', 'reservation', 'cost / price' or value for money and 'natural factors' seem to be some of the main attractive features for Korça visitors. Thus, from a marketing perspective, these attractions should be emphasized in promotional campaigns.

-In terms of socio-demographic characteristics, campaigns should target visitors in higher revenue categories.

Korça region has a lot of cultural and natural attractions, it is important to improve the access in these attractions, to improve services and develop alternative types of tourism to attract different types of tourists and to spread them all over the area for providing sustainability, good perceptions and good image.

Abstract: Business Models (BM) and their recent evolution have shaped the way in Business Strategy. It is widely accepted that the formulation and implementation of business strategies, and the need for the development of competitive advantages, is directly related to BM. Within this context, a variety of theories, approaches, and tools has emerged with significant impact on both academia and the business world. Despite the plethora of important theories and approaches, the important questions that have arisen after many years of research and business activity have not yet been answered. The main issue has proven to be the dispute on the general view of what success means and how can be measured. The profit models/formulas that are incorporated in every Business model and have been used extensively to measure BM success, as well as the overall business success, raise ambiguity over the results of such measurements. Moreover the profits, and profit based valuations, are criticized, on the basis that they fail to capture the long term dynamics, and the long-run success perspectives of every Business model, and thus incite the overall success of the Business Strategy employed. New approaches are more concentrated on the mechanics and the dynamics of the processes utilized to create and capture value and not in the ways that this value is turned to profits.

The need for a new approach, based on the processes of creating and capturing value, is more evident for Greek Companies. The special characteristics of the Greek economy, and its developments in the last 12 years, along with the inherited inability of Greek companies, to create and implement appropriate BM, and overall Business Strategies, constitutes the perfect environment for research in an effort to address the issue of processes based vs. profit based, BM. In this economic and business environment, that had a significant impact on the characteristics of Greek companies, the mechanics and dynamics of creating and capturing value can be seen as key-features in the construction and implementation of BM. In such a case, processes can be defined as a key measurement of business success, while the profits pursue turns to be misleading and biased, constituting a totally wrong approach in formulating and implementing an overall business strategy.

The analysis is based on an extensive literature review putting into perspective the concept of BM and its evolution, as well as an extensive overview of the models used by Greek companies, resulting on conclusions about whether they need to construct and implement processes-based BM, highlighting the process of creating and capturing value, instead of concentrating on the fallacy of profit-based BM. Finally, the study suggests directions of further research.

Key words: Business models, business model success, creating and capturing value, business strategy, Greek companies

1. INTRODUCTION

The concept of Business Models (BM), and its extension of Business Model Innovation (BMI), have being among the most popular concepts in management over the last 30 years, an appear today among the most important topics in the academic literature, with a very large part of the research conducted in the field of management every year, is spent on the development and analysis of such models (Applegate 2000; Weil and Vitale 2001). As a result a great number of BMs and BMIs have been described and used as the basis of analysis both for academic purposes and in the real world of business (Shafer et al. 2005; Zott et al.2011), and a variety of theories, approaches, and tools have emerged highlighting different aspects of BMs and BMIs. Among the most important aspects of BMs is their relationship to the concept of Business Strategy.

Despite the significant research, the plethora of important theories, approaches, and tools that have been developed, and the extensive use of BMs and BMIs, important issues have not been investigated in depth, and thus important questions remain, especially in relation to the factors that determine the success of these models. The reasons for the inability to form a common view on the determinants of the success of business models should be sought in the broad scope of business models, the tendency to overestimate certain elements of BMs and BMIs, as well as the confusion that often occurs in the relationship between business models and business strategy. New theoretical approaches attempt to describe the effectiveness of BMs, and therefore the success of the overall Business Strategy, based on more general considerations of what success means and how it can be measured. These efforts differ greatly from the classical approaches based on the use of profit models, contained in each BM, as the basic method for measuring their effectiveness and success.

New perspectives approach the effectiveness of the models, highlighting as key factor the element of "processes" which is also contained in every BM. Processes are the mechanics by which the company creates and captures value, by optimally utilize, the use of its resources and means, to deliver its value proposition. The dynamics and the mechanics of how a company creates and captures value, is considered to be the essence of every business model. The importance of "processes" in every BM, is also highlighted by the fact that innovations which are the key factors in the transformation of BMs to BMIs, are mostly related to the processes employed by the company as part of its Business Model.

On the other hand the profit model, which is also incorporated as a significant element, has an enormous affect in all the different parts and elements of the BM, mostly because it set to determine BM's success, based on the measurements of profits and other financial characteristics. The urge mostly by managers and shareholders, to measure success on the basis of profits, imposes the profit formula, or the profit model part of the BM, as the key element that determines the ways in which the Business Model evolves. To that extent innovation, as part of the processes, is appreciated not by its potential dynamics or the ingenuity of its mechanics, but strictly by its net contribution to income and profits.

The dispute of the profit based versus the processes based approaches to measure BM success, has gained a lot of attention in recent years, mostly because of the enormous impact of innovation. Nevertheless research on the subject appears to be primary and thus important questions still need to be addressed in order for the dispute to be resolved.

This paper, by focusing on Greek companies, and the developments in the Greek economy the last ten years, examines whether specific forms of BMs or BMIs, were designed and implemented by Greek companies, identifies its special characteristics, and proposes a new approach in determining the success of these business models. This study is part of a research which currently is in its initial stage of the literature review, and aims to exploit BMs and BMIs employed by Greek companies during the period of the Greek economy crisis , identify key success factors of these business models, and produce a methodology for measuring business model success based on these factors. The main research question to be investigated is whether the element of "processes" can be the main factor in the success of business models, and whether Greek companies based on this factor can indeed create and capture value. The aim of the research is also to create a specific methodology for measuring the success and effectiveness of business models based on the "process shaping" approach. In this paper, by using data from surveys conducted in Greece in recent years, concerning the role of innovation, digital transformation, and the substantial increase in R&D, as the main strategy employed by Greek

companies to overcome the impact of the economic crisis, an attempt is made, to describe the profound impact of innovation in shifting form the profit model approach of BMs, to a processes based approach, by which processes and value propositions emerge as the dominant elements of the success of Business Models implemented by Greek companies.

It must be noted that the paper do not consider the effects and the consequences of the last 16 months of the corona virus pandemic and its implications for businesses and economies

2. AN OVERVIEW OF BUSNIESS MODELS (BM) AND BUSINESS MODEL INNOVATION (BMI)

Business models are among the most important topics in the academic literature with a very large part of the research in the field of management spent every year on the development and analysis of such models. (Applegate 2000, Weil and Vitale 2001). As a result BMs have been described, explained and approached in many different ways, and have been used extensively both as a research platform in the academic world, and as a great tool by managers in the business world (Shafer et al. 2005; Zott et al.2011).. The main functions of a BM include the formulation and implementation of the basic goals and initiatives of a company, taking into account the means at its disposal, as well as the internal and external environment in which the company operates. BMs provide an overview of the course of the business which includes the specialization of goals, the development of policies to achieve the goals and the allocation of resources for implementation of these policies. In this context, BMs are inextricably linked to the formulation and implementation of the Business Strategy, and thus BMs and Business Strategy are interrelated, despite the fact that they differ significantly in terms of their conceptual definition. BMs describe how a company should be organized and operate in order to create and captures value (Osterwalder and Y. Pigneur 2010), while the Strategy describes the formulation and implementation of a comprehensive plan for developing competitive advantages over competitors (M. Porter 1985).

A significant number of different definitions, for BMs have been introduced in the academic literature, (e.g. Timmers, 1998; Amit & Zott, 2001; Gordijn et al., 2000; Osterwalder & Pigneur, 2002; Magretta, 2002; Faber et al., 2003; Osterwalder, 2004; Haaker et al., 2006; Lambert, 2008; DaSilva & Trkman, 2014; Christensen, Bartman, and van Bever 2016). According to the definition introduced by Osterwalder and Pigneur a business model is “the rationale of how an organization creates, delivers and captures value it describes how a company creates value for itself, while delivering products or services to customers” (Osterwalder and Y. Pigneur 2010). In other words, a BM is the business logic of how a company creates, distributes, and captures value (Heikkilä et.al 2016). A BM could also be collectively described as: a description of the entire system of how the firm operates (C. Markides 2015), a company’s value proposition (M.Morris, and M. Schindehutte 2005), the organization of the value logic of a company (E. Fiel 2013), and the combination of firm’s business strategy, organization, and capabilities (E. Casprini, T. Pucci and L. Zanni 2014). According to Tees, the BM defines: a) how a business creates and delivers value to its customers, and b) how it converts revenue stream into profits (Teece, 2010). Thus a BM must create value, but also commit a part of the value it creates (Chesbrough, 2007, 2010). A good BM should provide an attractive "value proposition" to customers, create an efficient risk and expected return relationship, and allow value commitment (Osterwalder and Pigneur, 2010).

Value creation identifies different values and their interrelation (McGrath, 2010), while value capture determines how value is delivered and monetized (Teece, 2010).

The variety of definitions proves that the concept of BMs has been, and still is, a very popular subject among academics, and managers. It also proves that progress in the field of BMs has intensified significantly and has had a profound effect on the science of Management. In the context of this intensification, issues such as innovation and technology emerged as key factors in the formation of BMs

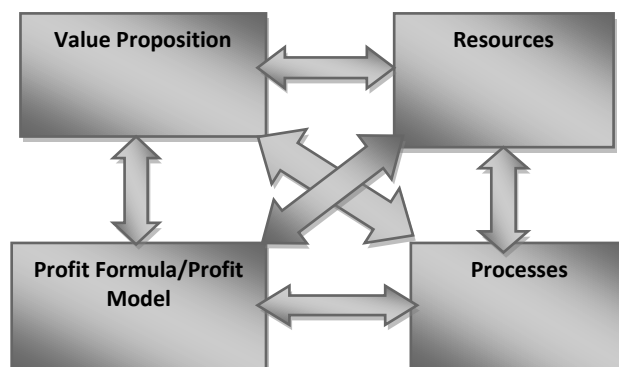

The extensive academic research on BMs, and especially the introduction of innovation and technology in the development of such models, have brought forward significant improvements of BMs, resulting to what is widely referred in the literature as the “Business Model Innovation BMIs” (Bonakdar, 2015; Bucherer et al., 2012; Hartmann et al., 2013; Lindgardt et al., 2009; Pohle and Chapman; 2006). The

introduction of the concept of innovation in the construction of business models, relates to the development of either innovative products or services, or the implementation of pioneering and innovative processes in the operation of the company. The development of an innovative business model can be an innovation in itself (Teece, 2010). These type of BMs have prevailed in recent years and thus "innovative business models BMIs" have dominate the academic and the business literature, and became the main business and strategic tools in terms of shaping competitive advantages by companies, mainly by exploiting the most efficient way of leveraging their resources (Chesbrough and Rosenbloom 2002). Even more, it is evident that without a good business model innovative companies will fail to take advantage of their innovation (Chesbrough, 2007). The development of BMIs can therefore be seen as the best possible way for a company to build and maintain a competitive advantage, and thus there is a strong relation with the formulation and implementation of Business Strategy (Magretta 2002; Teece 2010) , .

2.1 The basic elements of a Business Model

According to Christensen a BM is made up of four elements: (1) a value proposition for customers; (2) resources, such as people, money, and technology; (3) the processes that the organization uses to convert inputs to finished products or services; and (4) the profit formula that dictates the margins, asset velocity, and scale required to achieve an attractive return (Clay Christensen 2009, Clayton M. Christensen, Thomas Bartman, and Derek van Bever 2016). In the form proposed by Christensen the BM is viewed in a way that reveals the interdependences of its elements and highlights the framework by which the company exploits its capabilities. (figure 1)

Figure 1. Description of the elements of a Business Model

Source: Clayton M. Christensen, Thomas Bartman, and Derek van Bever (2016): Hard Truth Business Model Innovation September 13, 2016 MIT SLOAN MANAGEMENT REVIEW

This form of a BM introduced by C. Christensen and his colleagues, with the four basic blocks representing key features of how a company runs, although simple, compared to more complicated BMs, give a very good basis for exploiting the key elements of the model, its dynamics and mechanics, as well as the interrelation and interdependences, of these elements within the model. Collectively, the organization's resources and processes define its capabilities while its customer value proposition and profit formula characterize its priorities.

The Value Proposition: describes the products and services offered to the customers that create value for a specific customer segment by solving customer problems or by satisfying customer needs. This part of the model describes how the company communicates with, and reaches its customers to deliver the value proposition that creates. This encompasses all the ways the business interacts with the customers, including distribution channels, sales channels, marketing and other forms of communication

Resources: The resources can be viewed more as needs, than elements of the model, because they considered as the vital assets needed in order to support the business model. Resources can be either human, intellectual, financial or physical assets, and they are used to support, all the other elements of the BM. The key resources can either be owned by the company or leased or acquired through its strategic partners.

Processes: When the value proposition is described and the resources employed to deliver the value, processes emerge. Processes denote the way by which the company maximizes the utility of the resources in order to provide its value proposition to its customers in the best possible way. Processes comprise the activities a company has to perform to make its business model work. Such activities can be categorized into production related, problem-solving related or platform/network related activities and could include supply chain management, production management, marketing and sales management, and logistics, as well as any other activity by which the company creates and captures value.

The profit formula or the profit model is an integral part of any BM, for many companies is designed to be the key element of the BM and by default affects all the other elements of the model. The profit model dictates the margins, asset velocity, and scale required to achieve an attractive return, and in general describes how the company turns in to income, the value it creates and captures. It is also used extensively to measure BM's success.

The bidirectional arrows in figure 1 represent a crucial part of the model because they describe the interdependencies, which are very important for the integration required between each element of the model. A key concept of the interdependencies is the fact that they become stronger as the model evolves, more complex and less flexible. According to Christensen this is the main reason why BMs by their very nature are designed not to change, and they become more resistant to change as they develop over time. The strengthening of these interdependencies comes from the emergence of processes that arise as the natural, collective response to recurrent activities. The longer a business unit exists, the more often it will confront similar problems and the more ingrained its approaches to solving those problems will become (Clayton M. Christensen, Thomas Bartman, and Derek van Bever 2016).

The way the elements of the BM are interrelated and create interdependencies, and the fact that the profit formula in most of the models is designed to be the key element, that determines the way that the rest of the elements of the BM evolve, and in many cases dictates their development, constitutes a clear profit based approach in the way BMs are measured in terms of their success (Clayton M. Christensen, Thomas Bartman, and Derek van Bever 2016).

2.2 From Business Models (BMs) to Business Models Innovation (BMIs)

The introduction of innovations as part of the evolvement of BMs and the appearance of BMIs shifted the interest of many companies towards a rearrangement of the importance of the elements of the models. As innovations became the undisputable source of success they were inextricably associated with the value proposition and the processes parts of the BMs, and thus the dominance of the profit model was heavily disputed, both by academics and managers.

Research over the last 15 years regarding BMIs, link directly innovations with the processes or the value proposition aspects of the models, and also revealed the effects of innovations on the resources. Business model innovation BMI is described as an activity or process in which core elements of a firm and its business logic are deliberately altered (Bonakdar, 2015; Bucherer et al., 2012; Hartmann et al., 2013; Lindgardt et al., 2009; Pohle and Chapman; 2006). Numerous studies have shown that the basis of innovation is broad and can arise from many factors, such as trying to solve a problem, by the interactivity of relationships with the external environment, by systematically cultivating relationships that promote its process, by learning through the use, practice and exchange of knowledge and ideas (Georganta.Z 2003). In general, BMI is seen to be derived from the strategic activities of a company (Cortimiglia et al., 2016; DaSilva and Trkman, 2014), and managers are expected to maintain consistency between their strategic goals and the core components of the BMI (Demil and Lecocq, 2010).

Innovative business models BMIs have emerged as the main business and strategic tools in terms of shaping competitive advantages by companies, with a view to reducing costs, increasing revenue, using technological innovations, and the most efficient leveraging of the resources for each business (Chesbrough and Rosenbloom 2002). This means that innovation does not include small-scale changes that do not contribute to the substantial growth of a business, such as price change, a simple product upgrade, or seasonal changes (Frascati Manual), Baron & Tang, 2009). Recent studies have shown that

research has failed to identify methods and approaches that largely support the analysis of the viability and feasibility of innovative business models, and much more has failed to identify new ways of measuring success, of these models. In this context the value proposition and the processes, parts of BMIs became key elements, and are directly associated with the need to upgrade resources required. This created a sufficient requirement for a totally new way of constructing and utilizing the profit model, as innovations in order to improve products and processes, are often expensive, time consuming, and need substantial investment, with the return from all of these efforts being uncertain (Amit and Zott, 2012).

It is evident that the progression from BMs to BMIs created a dispute over the dominant part of every business model. Academics, researchers and practitioners, having appreciated the importance of innovations, in the way the business world is shaped the last 20 years, are shifting their interest in the construction of models that would be mostly concentrating in the development of BMIs with the scope to maximize the use of innovations, and new technologies. Even more they tend to question the ways by which BMs measured success based on profits, margins, asset velocity, and scale required to achieve an attractive return (Clayton M. Christensen, Thomas Bartman, and Derek van Bever 2016).

2.3 Measuring the success of BMs and BMIs. The Profit model/profit formula fallacy

Concepts such as profit and cost, and more generally the financial characteristics and measures and their corresponding indicators, are among the most prestigious issues, that dominate research mostly because they are considered as the main method, the basic metrics, of measuring the success of companies. The financial measures in general focus on revenue growth, cost management, asset utilization and market capitalization (Torbay et al. 2001). All this aspects that are in short indicated as the profit model of every company have dominated the way both academics and practitioners perceive success over the years. A great example of this approach comes from Afuah and Tucci (2003) that propose to evaluate the business model on three levels: profitability measures, profitability predictor measures and business model components attribute measures.

Such concepts under the emergence of BMIs began to lose their place as the only and insurmountable determinants of business model success. To that extent differences emerged in research, concerning the scope of profit models, caused a number of researchers and academics to differ from the prevailing view that the profit model, is the most important component of every BM. Many attempts were trying to approach the concept of success by highlighting other elements as important and critical, thus forming a wide field of dispute and the need for further research. This became more evident when innovation emerged as the single most important element in the transformation of BMs to BMIs. Many academics and researchers argue that the most important parameter in shaping a company's strategy and capturing the "competitive advantage" cannot be formed only by calculating and comparing the financial elements of a company. New approaches provide a huge basis for parameters such as innovation, market penetration dynamics, customer creation dynamics, customer expansion rate, ideal customer formation dynamics, and customer retention capacity that defy the obsession of profits (Johnson et al. 2008).

Professor Christensen contributed to the notion of the profit model fallacy in his remarks on what is ultimately good management "Good management has to do with the day-to-day effort to help people get better at doing their job better and therefore living their lives better" (Christensen, Clayton: Capturing the upside. 'Open Source Business Conference, IT Conversations (2004). Professor Markides also argues that profits are a by-product of business activity, as companies what they have to do and where they need to focus is to create excellent products that consumers will love and when that happens then businesses will also generate profits. (Markides. C 1997)

The profit models included in BMs are set to measure success by exploiting different aspects that include profitability, competitiveness, and performance, mainly by focusing on financial analysis. Profitability is basically measured in terms of earnings, cash flow, profit margins, revenues, market share and revenue growth. Competitiveness is measured by focusing on financial analysis which includes: (i) the absolute indicators such as net profit/loss per the period, turnover amount etc., (ii) ratio indicators

such as profitability, liquidity, indebtedness, productivity etc., and (iii) difference indicators such as profit increase/decrease, turnover increase/decrease etc. Performance comparison of business is used as a means of establishing achievable goals aimed at obtaining organizational superiority.

The fallacy with financial measures is that they present and analyze past events, and fail to critically assess the long-term capabilities of a company. These financial measures seem inadequate for guiding and evaluating the creation of future values through investment in customers, suppliers, employees, processes, technology, and innovation (R. S. Kaplan and D.P. Norton, 1996,). To that extent profit models that depend on their ability to measure success based on financial measures also fail to capture an properly evaluate the impact of future aspects of the BMs such as customers, suppliers, employees, processes, and mostly innovation and new technologies. Osterwalder and Pigneur claim that a firm's understanding of the customer segment is instrumental for its survival and success, and has defined it as a compartmentalized part in the BM of every company, and thus non-financial indicators need to be used (Osterwalder and Pigneur 2010). As the main goal of BMs and BMIs is the transformation of company visions and strategies into particular goals, indicators, tasks and measures a wide range of indicators from various areas of the company which are subject matter of both quantitative methods and qualitative methods, or a combination of both methods need to be exploited (Donnelly et. al., 2006; Hakes, 2007; Kaplan and Norton, 2005). These methods must be able to assess not only the current company competitiveness, as it results from the use of innovations and technology, but also evaluate interconnections with the company's Business Strategy. According to many authors the technological renewal and the differentiation of the products is the main lever of strengthening the competitiveness of the companies in the pursuit of success (S Karagiannis, M Feridun, 2009).

2.4 New approaches to evaluate Business Models Efficiency and success.

The emergence of innovative business models is currently the basis of research activity worldwide in both the development of business models and in the field of Business Strategy, and are considered among the most important issues in Management (Bonakdar, 2015; Bucherer et al., 2012; Hartmann et al., 2013; Lindgardt et al., 2009; Pohle and Chapman; 2006). In spite of the importance of innovation and new technologies, business model innovation BMI evaluation as a topic has not received much attention in the literature. Some researchers have described measurements and indicators that can be used for measuring the performance of the BMIs without the use of the profit model and its financial indicators. Since the evaluation of business models is inherently complex and to some extent dependent on other knowledge domains researchers have produced approaches for business model evaluation, that are not exclusively profit based, even before the emergence of innovations and the development of BMIs.

Hammel (2000) has proposed a business model evaluation framework with a focus on its wealth potential, which covers four factors: (i) the efficiency of business model in delivering benefits to customers; (ii) the uniqueness of the business model; (iii) the degree of fit of the business model's components; and (iv) the exploitation of profit boosters that can generate above average returns for the company. Profit boosters are: increasing returns, competitor lock-out, strategic economies and strategic flexibility.

Customer development processes were very popular in the evaluation of the company and its business model. Customer relationships can increase the number of customers through customer acquisition, customer retention, or customer transformation. The Customer relationship approach examines whether target customers will be interested in the value proposition.. A consensus between the customers and the company is necessary to make a business model into a feasible and successful one. The customer development process consists of four steps: (i) customer discovery, (ii) customer validation, (iii) customer creation and (iv) company building. Customer development is very useful as a learning and discovery process before executing the business model (Blank 2006).

Performance measurement frameworks such as Balanced Scorecard (Kaplan & Norton, 1992), designed to facilitate the development and deployment of appropriate performance measures through the operations of the company, is another example of a non-profit based approach The Balance Scorecard which is the most commonly used and well known framework achieves this by deploying strategic

objectives in the context of a business model, or strategy map (Kaplan & Norton, 1996, 2000). This approach focuses on the alignment of “operate and support” processes for achieving business objectives which is considered to be a short term driver of success but not on its own a source of long term sustained competitive advantage. The main goal of Balanced Scorecard is therefore transformation of company’s visions and strategies into particular goals, indicators, tasks and measures.

A similar method for evaluating business models proposed by Torbay et al. (2001) which was based on the balanced scorecard approach (Kaplan and Norton 1996). The factors that are examined by the balance scoreboard correspond precisely with the four business model components proposed by Torbay et al. (2001) and by Christensen et al. (2016). The first part of the balance scorecard assesses the originality of the value proposition, with a perspective to identify long-term growth and innovation. That includes creativity, employee capabilities, and motivation. The second part evaluates the relationships of the company with the customers that includes retention, acquisition, satisfaction, profitability, and the appreciation of the value proposition by the customers, in terms of functionality, quality, price, timelines, brand image, and availability. The third part identifies internal and external or outsourced activities of the value chain and processes. The fourth part is concerned with financial objectives.

These attempts along with many others that were employed to produce methods of evaluating the efficiency of BMs, and ultimately measure its success, defy the role of the profit model and its undisputable key position that served as common logic in the construction of most of the models, and promote new approaches in evaluating the overall performance of BMs. The emergence of innovations and the corresponding need for the maximum utilization of new technologies as the main components of the new BMs, brought forward all these attempts, in an effort to develop new and more constructive ways to evaluate the efficiency and measure the success of these new models.

3. GREEK COMPANIES AND THE USE OF BMs and BMIs

3.1 The economic environment during the crisis and its implications for the Greek companies

Developments in the economic environment of Greece over the last ten years can be characterized as catastrophic for both companies and society in general. The substantial bankruptcy of the country and the implementation of successive economic adjustment programs which were mainly imposed by the EU resulted in more than 25% of GDP and consequently the disposable income of Greeks disappearing. According to the annual National Accounts statistics released by the Hellenic Statistical Authority over the course of the recession of 2008-2013, GDP plummeted by 26.4%. (Hellenic Statistics Authority: National Accounts statistics 2015)

In this environment, Greek companies experienced an unprecedented situation where the economic environment essentially collapsed and the companies found themselves in front of the spectrum of mass bankruptcies. In the first years of the crisis, the environment in which Greek companies were called to survive in addition to lost consumer income, which translated directly into lost revenues, and a significant downgrade of all key financial indicators for companies in most sectors of the Greek economy, there was a significant reduction in funding, mainly due to the miserable situation of Greek banks. It is noteworthy that financing for businesses declined with a significant slowdown observed in the rate of credit expansion to all key sectors of activity, namely agriculture (-0.4%), industry (-0.7%), trade (-3.2%), construction (-0.2%) and non-shipping (10.6%), with the result that almost all sub-categories of loans went through negative rates of change (Bank of Greece 2011)

In this prolonged period of deep crisis whose main features were the continuous decline of economic activity, the significant recession of the economy, the decline in turnover, and the reversal in profitability, with a direct impact on the operation and performance in the whole range of commercial and industrial activities (Annual Report of Greek Trade 2011), Greek companies faced ultimate challenges. The crisis had also an enormous effect on the rates of employment for the whole country. Job losses by business employees in the private sector were significant (Nikova.D, Aspridis.G, Koffas. S. 2015). Especially in the first years of the crisis, the need for the right strategy became evident, and the usefulness of BMs began to emerge, mainly because many companies entered the crisis without a specific plan, or a specific strategy. As a natural reaction to the crisis, most companies focused on

reducing operating costs, by reducing staff and downsizing activities. Studies showed that the most likely way to respond to the crisis according to 93% of companies was to cut operating costs, followed by a reduction in profit margins. This clearly implies that most companies, focus on their profit model as a basic tool to overcome the crisis. What became clear as the crisis progressed was that in order for companies to withstand the crisis, they would have to move away from managing their profit model and maintain a high competitive advantage over their competitors, be flexible, adapt in a timely manner, to innovate and make use of technology and various modern means.

3.2 Factors that shaped Business Models in Greek companies during the economic crisis

The economic crisis showed that Greek companies did not have a strong competitive position in the international industry value chains and mainly it seemed that they used quite simplistic business models, or did not use business models at all. This conclusion reveal a specific attitude towards the use of BMs by Greek companies that was strongly supported by a significant survey conducted in 5 European countries (Poland, Greece, Italy, Slovenia, Czech Republic), entitled "Understanding and Creating a Business Model (ProBM)"- 2016-2018 and focused on exchanging good practices and the collection of information on business models, and their use by companies in each country, The analysis for Greece, conducted by the Institute of Entrepreneurship Development, presented some important conclusions regarding the use BMs by Greek companies. ("Understanding and Creating a Business Model (ProBM)" Institute of Entrepreneurship Development 2018) The key conclusion was that in Greece, BMs are not used by companies mainly because there is not enough information and training, in relation to the existence and importance of such models, or because companies simply avoid the use of BMs. Nevertheless in the conclusions it was observed that many companies, while not using a specific model, performed actions that are probably parts of one or more business models (Chesbrough 2007; Al-Debei and Avison 2010). At the same time the survey showed that most entrepreneurs were able to identify which of these parts were critical to the viability of their business. Important aspects that were highlighted in the survey also include that entrepreneurs are orientated towards sustainability, with a tendency for low-cost models that utilize direct sales. The emphasis on the importance of the cost structure of the companies which is derived from the survey shows a clear relationship between the absence of substantial, structured and integrated business models, and substitution from a more general approach of determining viability based on revenue, profits, and business cost structure. Even in cases where it was acknowledged by entrepreneurs that there are many weaknesses due to non-use of business models, these weaknesses were mainly identified in terms of ineffective sustainability in the face of intense competition. ("Understanding and Creating a Business Model (ProBM)" Institute of Entrepreneurship Development 2018)

The results of the survey portray the value of BMs and thus became evident that Greek companies in order to deal with the crisis had to understand the significance of the use of such models, and the acquisition of the relevant skills to execute the elements of BMs. It also became clear that, in this context BMs and mostly BMIs emerged as the most efficient way for Greek companies to manage market-related changes, and design the necessary measures to be taken in order to ensure that they will be ready for the changes implemented by the crisis (Tang et al., 2010). In conclusion the survey supported the evidence that Greek companies even before the outbreak of the economic crisis had the tendency to avoid the use of integrated BMs and they were mainly concentrated in informal models that were based on profit formulas as key elements in the way success was measured. Crisis led these companies in really difficult times were the only available action that could be taken was to manage the elements of the profit formula and trade off profit margins and costs. For most of the companies the tradeoff did not work out, as the informal profit based BMs, failed to produce a sustainable and viable solution for most of the companies. ("Understanding and Creating a Business Model (ProBM)" Institute of Entrepreneurship Development 2018)

In this economic environment innovation emerged as a very promising prospect for companies to deal with the deep problems imposed by the crisis. Innovation was considered at the time, intertwined with the survival of companies, mostly because it was directly associated with competitive advantages. Many Greek companies in an effort to battle the crisis and create prospects for growth relied on innovation as

the basic element of success, by exploiting competitive advantages not only in innovative and technologically renewed products or in the continuous improvement of production processes that will ensure lower costs, but also in a more efficient and innovative marketing. (Georganta.Z, 2003).

Inevitably innovation had an enormous effect in the way Greek companies perceived their BMs, even the informal models that most of the companies used. Innovation had designated a new form of BMs for Greek companies. These BMs by default shaped the “processes” and the “value proposition” as key elements in the success of the models. Innovation is based either in processes or the value proposition and thus the essence of the BMs shifted to these elements, defying the importance of profit models. The need for the upgrade of the resources as a necessary requirement for the successful launch of innovations gave great scope for the profit model to be converted in a supportive tool rather than a key element with its main role to be the allocation of funds.

The allocation of funds to support innovation is related with increasing the basic knowledge and, consequently, the ability to understand, absorb and utilize new technologies as part of the innovation process. Thus allocation of funds is also directly associated with Research & Development. With innovation closely related and interdependent with new technologies Research and Development had to be included by Greek companies in their resources upgrade.

In order to examine and support the idea of the necessity of BMs utilized by Greek companies as a main way of overcoming the crisis and creating prospects for the future, data from surveys carried out in Greece on innovation, Digital Transformation, and Research and development, were utilized to establish a strong pattern of redirecting business strategies of most of the Greek companies towards innovation. The results show a significant shift of many Greek companies towards the use of innovation the exploitation of new technologies through R&D, as part of a new approach in the way that they perceive their formal or informal BMs.

These surveys carried out in Greece from 2010 to 2018, researching business activities, their connection to innovation and the introduction of innovation by companies, also examine Digital Transformation, and R&D development, as part of “The Community Innovation Survey” which is the official European statistical survey on innovation in the countries of the European Union. Such surveys are conducted every two years in all EU member states through a single standard questionnaire, in accordance with European legislation, the methodological guidelines of the Oslo manual and the Eurostat guidelines, ensuring high quality and comparability in the indicators of the EU member states.

Data is collected on product innovations, business process innovations, business innovation activities, the introduction of new products to the business and market, strategies, knowledge flows and business partnerships, various forms of financing, the impact of legislation on innovation activities, as well as the obstacles that companies face in developing innovation. The survey also explores the position of Digital Transformation in strategic business planning as a continuous development strategy, as well as the research on all actors who are known to carry out R&D activities. The data are published in detail on the relevant website of the ESF (<https://metrics.ekt.gr>) and by Eurostat in the relevant database, by sector of economic activity and by size class (number of employees) of companies.

3.3 Innovations

The preliminary data for the key indicators of business innovation in Greece in the period 2010 - 2018, according to the results of the pan-Hellenic statistical survey conducted by the National Center for Documentation and Electronic Content (EKT), as the competent national authority of Hellenic Statistical System, in collaboration with the Hellenic Statistical Authority. A mentioned before the Business Innovation Statistical Survey is part of the pan-European Community Innovation Survey (CIS) on EU innovation and business innovation.

In the period 2016-2018, the percentage of innovative companies in Greece amounts to 60.3%, showing an increase of 2.6 percentage points compared to the immediately preceding three years 2014-2016.

Product innovations involve the development of new or improved products, goods and / or services, which differ significantly from the company's previous products and have been introduced to the

market. Innovative products are considered to be products that are first introduced to the market (new to market), and products that are new / improved products for the company, but are the same or similar to those already offered on the market by other companies and thus they are new to the firm.

In the period 2016-2018, the percentage of companies in Greece with product innovations amounts to 42.5%, compared to 30.7% in the period 2014-2016, showing an increase of 11.8 percentage points. Compared to the first reference period 2010-2012, this percentage is more than double (table1).

In the Services sector, the percentage of innovative companies in the period 2016-2018 amounts to 58.9%, compared to 56.5% in the period 2014-2016, showing an increase of 2.4 percentage points

Business process innovations are the new type of innovation introduced with the 4th revised version of the Oslo handbook and implemented from the 2016-2018 reporting period onwards. This new type of innovation replaced process innovation, organizational innovation and marketing innovation, which were listed as three distinct types of innovation in the previous reporting periods 2010-2012, 2012-2014 and 2014-2016.(* table 1)

It should be noted, however, that there is no absolute correspondence and comparability of business process innovation with the three types of innovation mentioned above, both because the way of measuring has been differentiated and because business process innovations include other sub-business functions

As shown in table 1, in the period 2016-2018, 55.2% of companies developed innovations related to business processes. For reasons of completeness of information and without suggesting any kind of correlation, the same table shows the percentage (%) of companies with process innovation, organizational innovation and marketing innovation for the previous three periods 2010-2012, 2012-2014 and 2014-2016.

Table 1 Greek innovative companies by categories 2010-2018

	2010 - 2012	2012 - 2014	2014 - 2016	2016 - 2018
Greek Innovative companies in total (%)	52.3	51.0	57.7	60.3
Greek innovative companies in industry (%)	52.8	54.5	59.5	62.4
Greek innovative companies in services (%)	51.8	43.0	56.5	58.0
Greek innovative Small/Very small companies (%)	50.7	49.7	55.3	57.6
Greek innovative medium size companies (%)	60.7	55.2	67.2	70.6
Greek innovative Big companies (%)	75.6	86.4	83.9	90.3
Greek companies with innovative products (%)	19.5	23.4	30.7	42.5
Greek companies with Business innovations* (%)				
<i>1.Processes innovation (%)</i>	25.6	29.6	39.3	55.2
<i>2.Organizational innovations (%)</i>	30.2	25.5	32.2	
<i>3. Marketing innovations (%)</i>	34.8	32.5	38.4	

Source: Innovations - National Center for Documentation and Electronic Content (EKT) Greece – 2010-2012, 2012-2014, 2014-2016, 2016-2018.

3.4 Digital transformation

The National Center for Documentation and Electronic Content (ECB), in the framework of the Survey on Innovation in Greek Enterprises for the period 2016-2018, which concerns a population of 12,213 enterprises, with more than 10 employees, conducted a study on the Digital Transformation in various branches of economic activity. In the recording of the period 2016-2018, additional variables were examined regarding the strategies, practices and the use of technologies related to the Digital Transformation of enterprises. The primary data were collected in the framework of the official statistics

"Research on Business Innovation" for the period 2016-2018, implemented by the ESF, as the competent national authority of the Greek Statistical System.

The survey explores the position of Digital Transformation in strategic business planning as a continuous development strategy and captures the main areas of digital transformation for Greek companies. In addition, it provides evidence for the adoption of digital methods of work organization, as well as the use of digital practices to access new markets or increase market share. Regarding the contribution of digital technologies to the innovative performance of Greek companies, issues such as the extent and intensity of the application of digital technologies in the development of innovations, the internal digital capabilities of companies and the digital skills of their staff were explored.

In the period 2016-2018, 33.5% of the country's businesses consider Digital Transformation as a very important growth strategy. Specifically, 4,088 companies in a population of 12,213 companies, with 10 employees and more, in Industry and Services, place great emphasis on Digital Transformation as a continuous strategy for the further development of their business. In large companies, with more than 250 employees, the percentage is 51.5%, while for SMEs the percentage is 33.1%

An important point to be highlighted is the difference between small and medium-sized enterprises in terms of evaluating digital upgrade strategies as very important. Strategies related to the production of goods and services, the improvement of the supply chain and the reorganization of business processes are considered by large companies as the most important, with differences of more than 10 percentage points, compared to small and medium enterprises (table 2)

In contrast, the strategies for improving customer relations and communication (Installing customer management systems and Enhancing digital channels to improve communication), which show the lowest relevance rates, record the lowest difference in evaluation between small and medium-sized enterprises, with less than 10 percentage points.(table 2)

Also noteworthy is the difference between the evaluation of large companies in relation to small and medium, for the importance of enhancing the digital skills of their staff. In this sector, there is a difference of 11.6 percentage points, with large companies considering the enhancement of digital skills as a more important strategy of digital upgrade, compared to small and medium enterprises (table 2)

Table 2 More important strategies for digital upgrade

	Total	SME's	BIG
Strategies related to the improvement of products and services	34.5	34.2	47.2
Reorganizing Business Processes	30.7	30.4	43.4
Improvement in the Supply Chain and the Logistics	27.2	26.9	40.3
Enhancement of digital skills	27.0	26.8	38.4
Social Media	26.0	25.8	34.3
Customer Resource Management	25.3	25.2	30.7

Source: Digital Transformation - National Center for Documentation and Electronic Content (EKT) Greece 2016-2018

A very important aspect of the survey was the analysis of pioneering digital technologies that were evaluated by Greek companies as very important for their future development. The technologies evaluated were: Big Data Analytics, 3D Printing, Automation and Robotics, Artificial Intelligence, Cloud Computing & services, Internet of Things Things), Transaction chain technologies (Blockchain). Table 3 presents areas of pioneering digital technologies that were evaluated by Greek companies as very important for their future development.

Table 3. Areas of pioneering digital technologies that were evaluated by Greek companies as very important for their future development

	Greek Companies in Total	Industry Sector	Services Sector	Non innovative Companies	Innovative Companies
Big Data analysis (%)	13.8	12.9	17.1	7.7	17.8
3D printing (%)	5.3	7.3	3.9	3.4	6.5

Robotics (%)	10.5	13.2	8.5	5.7	13.6
A.I (%)	6.4	4.2	7.9	3.0	8.6
Cloud Computing (%)	11.9	6.4	15.8	6.8	15.2
Internet of Things (%)	15.9	12.9	18.1	9.2	20.4
Block chain (%)	7.5	5.2	9.0	4.8	9.2

3.5 Research & Development

In a similar survey The National Center for Documentation and Electronic Content (www.ekt.gr), has been collecting and processing R&D statistics since April 2012, with the first reference year being 2011. The research was carried out on all actors who are known to carry out R&D activities. The data were collected by a combination of inventory and sampling in the Business Enterprises Sector (BES). The registry is updated on a systematic basis.

According to the Frascati Handbook, Research and Development is the creative and systematic work undertaken to increase the stock of knowledge. The term R&D covers three activities: basic research, applied research and experimental development. Basic research is experimental or theoretical work undertaken with the main purpose of acquiring new knowledge about the underlying fundamentals characteristics of phenomena and observable events, without aiming at a specific application or use. Applied research is also undertaken in order to acquire new knowledge. It is, however, mainly oriented towards a specific practical purpose or goal. Experimental development is systematic work, which draws on the knowledge gained from research and practical experience and produces additional knowledge and which is oriented towards the production of new products or processes or the improvement of existing products or processes.

According to the results of the survey, the total R&D expenditures in Greece in 2019 are 2,336.58 million Euros, increased by 157.27 million Euros (growth rate of 7.2%) compared to 2018. R&D expenditures are included in the country's GDP as, according to with the revised European System of Accounts ESA 2010, are recorded as fixed capital expenditure. In 2019, the R&D expenditure ratio as % of GDP ("R&D intensity") stands at 1.27% from 1.21% in 2018, according to the new revised GDP prices in Greece, showing an increase of 0.06 percentage points. In the business sector (BES sector) in 2019 the total R&D expenditures amount to 1,073.22 million Euros, showing an increase of 2.3% compared to 2018.

Business Enterprise Sector (BES): includes companies, organizations and institutions, whose main activity is the production of products or services (except higher education). In addition, this sector includes public companies, private non-profit organizations that provide services to companies. Table 4 presents the basic data of the survey collectively

Table 4: R&D expenditure, country GDP and R&D intensity (R&D expenditure as% of GDP), 2011 – 2019

Sources from which R&D expenditure is financed for BES (in € million), 2011 - 2019

	2011	2012	2013	2014	2015	2016	2017	2018	2019
Total R&D Expenditures (millions. €)	1.391,16	1.337,60	1.465,67	1.488,74	1.703,82	1.754,18	2.038,43	2.179,31	2.336,58
R&D / GDP	203.308,20	188.388,70	179.616,40	177.349,40	176.110,20	174.236,90	177.151,90	179.727,30	183.413,50
R&D Intensity	0,68%	0,71%	0,82%	0,84%	0,97%	1,01%	1,15%	1,21%	1,27%

3.6 Results

The surveys presented in this paper support the evidence of a significant shift of Greek companies towards innovations and new technologies. It also give a clear view of a consensus among Greek companies concerning the utility of these new BMIs and the corresponding need for new business strategies. The research carried out analyzing data since 2010 concerning innovation digital transformation, and R&D development support fully the assessment that Greek companies have shifted their interest, innovation has evolved to be the key element of informal BMIs employed by Greek companies and thus there is a great need for the construction of formal integrated BMIs. The results collectively show:

- Substantial increase in Greek companies involved with innovations
- Substantial use of new technologies by Greek companies
- Rapid adaptation to digital transformation by Greek companies
- Extended use of R&D as a part of the resources reordering process.

4. NEW APPROACHES IN CONSTRUCTING BUSINESS MODELS FOR GREEK COMPANIES. THE NEED FOR INNOVATION - PROCESSES BASED BUSINESS MODELS

4.1 The post – crisis environment. Prospects and strategies.

Greek companies' resilience to the crisis depended on their ability to build and maintain a comparative advantage at lower cost levels by offering quality products at more affordable prices. With the deepening of the crisis it became evident that the traditional approaches based on the profit margins and costs tradeoff did not work. As a result many companies shifted towards innovation and new technologies as the only viable way to create and maintain competitive advantages. That became their basic BMI and their new business strategy whether moving domestically or internationally, as new markets opened to competition for Greek companies.

It seems that a comprehensive competitive strategy for Greek companies will play a more important role in the years ahead, due to over-competition, imbalances in the markets, intense differentiation of offers with quality and innovations at lower cost levels. In this environment Greek companies are expected to be compared with reference to companies competing in international markets rather than domestic markets. That requires more intense entrepreneurship with new models, new ventures, and diversity. Investing in the ingenuity of human resources and directed to the creation and commercial utilization of new innovations. Extroversion is also very important, not only with the traditional form of exports, but also with advanced forms of internationalization that include collaborations, joint ventures abroad, international networking, and utilization of international sources of innovation and opportunities for obtaining resources internationally.

The new business environment for Greek companies is expected to have increased demand, with more competition in supply, shaped from well-informed consumers who want to meet the same needs with less money. Internationalization will be intensified with foreign products increasing their presence in the domestic market especially from emerging multinationals from low-cost countries on products with intermediate price-cost combinations. In this environment Greek companies with their products and services seek their positions (Lioukas S. 2010). Strategies targeting relatively easily satisfied customers, especially in the domestic market, with minimal innovation and lean local branding is not expected to be the proper strategy. Lower costs seem to be important but they are not enough without other elements of differentiation. Innovation, in products and in the production process, is already proven to be a critical factor in the forthcoming years. Greek companies must invest in innovation and new technologies in order to achieve continuous differences in their products and services. The scale at which they need to invest in innovations can be moderate instead of bearing the risk involved with great innovation projects. Sources of ideas can even be found in the market by customers mainly, but also by collaborations and networking, and by the employees themselves. This new type of "open" innovation fits well with Greek business practice and must be deeply exploited. Successful companies will intensify

their efforts to continuously introduce innovations, mainly drawing ideas from customers, suppliers and other partners in the international market. It seems inevitable to follow an "open innovation" model. Obtaining and utilizing ideas from the market, most likely from the international one, and applying them both locally and internationally could very well lead to a series of small innovations, which could shape a successful course.

4.2 New innovation and technology – processes based BMIs for Greek companies

The necessity of the transition of Greek companies to innovations and digital transformation is considered to be imperative in context of the overcoming the effects of the economic crisis and at the same time preparing for the future. In this highly uncertain, complex and fast-moving environment of the post-crisis period in Greece, where the element of internationalization of business activities is an important issue, new Business Strategies for Greek companies must incorporate traditional skills of planning and executing those strategies and support them with integrated BMIs. The emphasis on the construction and the implementation of new integrated BMIs must incorporate all these elements that have been proven to be a very important for the nature of the business and economic environment that is formed, both domestically and internationally. Greek companies in order to prevail must adapt to new technologies, introduce innovations, reorder their resources, and be more flexible and agile in their operations. They also need to include experimentation, as part of their BMIs, which itself form a source of competitive advantage, as some firms develop superior capabilities at experimentation and therefore can build better business models and quicker than the competition (McGrath 2010; Teece 2010).

It is evident that the lessons learned from the crisis, and the pressures imposed by the emerging business environment, calls for Greek companies to proceed with a systematic approach in constructing integrated BMIs and align them with the proper business strategies. Such BMIs must be innovation and technology oriented, and must be directed towards the maximum utilization of the element of processes. In this context BMIs for Greek companies must form also taking in to account that:

- The majority of Greek companies are SMEs and need to design precise, less complex, and flexible BMIs. They do not have to invest heavily in Research and Development, but instead they can exploit marginal innovations, with moderate investments, not only in products but in processes as well, which are more appropriate for Greek business practice.
- BMIs must be focused in strengthening the mechanisms for acquiring and implementing ideas, international networking, extroversion, the upgrade of resources, and the maximum utilization of technological differentiation rather than focus in measuring financial success
- Part of this approach to innovation exploitation, that require moderate investments, could also be the extensive and constructive use of the highly educated work force of Greece, cost innovations in the value chain, negotiating with suppliers, streamlining the product range, reducing brand prices, and focusing on new products more economically. Evidence that such strategies work and suits better Greek companies, also comes from empirical research even before the crisis (Spanos, Lioukas, and Zaralis, 2004).
- Greek companies must always be open to recruit, assimilate, adapt and create and this must be embodied in BMIs.
- The element of internationalization especially in terms of recourses and opportunities must also be taking in to account in the formation of the models, as most likely successful businesses will be compared to the international level.
- Business Strategies alignment with new BMIs also required because this is considered to be crucial, in the development of competitiveness. Competitiveness determines also whether Greek products and services will exist in the open international markets.
- Cooperation between enterprises based on strategic alliances could also contribute to more effective measurement of competitive strength of businesses and thereby improve their competitive position.

The success of any new BMI, apart from highlighting innovations and new technologies, and the processes related to them, as their key elements, depends on how Greek companies understand and adapt to changes in the economic and business environment realizing that the future of businesses as a whole is innovative and digital.

5. CONCLUSIONS

This paper, by referring to the definition and by presenting the characteristics of BMs and BMIs examines the impact of the Greek economic crisis that erupted the last decade, and brought forward the need for the adaptation of new formal BMIs by the Greek companies. In these new BMIs innovation and new technologies has already being identified as the key elements in the construction of these models. Even more BMIs must be oriented towards the maximum utilization of innovations and technologies and thus must be processes driven In these models the profit formula could very well serve as the basic form of financing the reordering of recourses, the reconstruction of processes, and the maximization of the value proposition in an attempt to exploit constant competitive advantages and sustainable growth. It is the view of this paper that Greek companies must be engaged seriously with the use of BMIs in an integrated and formal way that would shape their Business Strategy on the basis of their interdependencies in order to create sustainable competitive advantages that will ensure future prospects in a highly volatile domestic and international environment.

Abstract: The financial system of every country is considered as an important intermediary with a great impact on the real sector development, offering liquidity and the payments system, aiming to a continous increase of Gross Domestic Product. The equilibrium between aggregate demand and supply is realized along with the liquidity of the banking system. In this context, the banking system liquidity is continously studied with analysis of researchers and bank managers, responsible to the funds management in commercial and central bank. A great number of studies and research articles have treated liquidity risk with statistical and econometric models, finding two groups of factors that determine banks' liquidity. The specific factors of banking industry (internal bank's factors) and external factors. This study is making analysis using econometric methods through the hypothesis.

This phase of analysis gives us the possibilities to specify for Albanian Banks main factors that are important in their impact for liquidity, as well as the relations between factors verified with econometric programs (regression analysis) realised with a database of 10 year series of information. Dependent variables are expresed with liquidity ratios and models for every equation gives the answer to what corelation is every factor.

The specific factors for the industry: bank capital, bank size, profitability, non-performing loans, interbank rates, central bank base rate and the economic activity are used based in literature findings. Econometric models derived from analysis show the relations and determinants of liquidity in Albanian banking system and explains the direct and indirect factors.

Albanian banking system is working very hard to reduce the cash used widely in our economy, but this is still a problem for policymakers.

This study presented in the paper explains which of the factors that affect liquidity is more important/or less important and gives a small contribution to few studies of Albanian researcers.

Key words: Liquidity, Liquidity ratios, determinants of liquidity, commercial banks

1. Introduction

The market liquidity risk is considered an important issue which is evident when a bank can not easily compensate, or eliminate a position at market price because of narrow market or different troubles. (Vodova, 2011), (Gianfranco A. Veneto, Pasquale La Ganga., 2009) authors stress the fact that liquidity risk is not an isolated risk – at contrary, it is an important risk, with its own characteristics that can deteriorated or influenced from other financial and operational financial risks within the banking bussines. Liquidity risk is the main risk for bank failures – with negative inapct on bank earnings and capital. with less profit, or other diminished form of investment.

The liquidity is given as liquid assets held from banks to aford the customers' demand for liquidity and at the same time to achieve the increase of profits target for owners of this business. Considering this, the exposure to liquidity risk is among the risks that financial institutions face often – as now-a-days they work without time limits (24 hours/7 days) This way inflow of funds and outflows can result with deficits or suficits in liquidity.

This article studies the factors that are affecting liquidity on Albanian banking system Regression Models used with e-views are employed to prove the relation between liquidity and internal and external factors. The literature on liquidity risk gives a great importance on analysis some liquidity ratios, and at the same time the correlation shows as more important L1 and L2.

2. The contribution of banking system in the Albanian economy

The Albanian banking system activity is increased, since 1992 when the laws that regulate the activity of central bank and second level banks entered in power. Albanian banks are playing a very important role to the stable development and social wellness of the country. The economic support of the banking system starts with deposits collection as the base to the money supply and savings collection. Banks are holding the biggest part of government debt (almost 60 % of total debt)

The structure of banking and financial system at the end of 2020 shows 12 commercial banks operating, 31 non-bank financial subjects, 14 savings and loan Unions, and 488 Foreign Exchange Offices. Albanian banks have been classified according to their size, capital origin and territory of activity, as counted of *Individual bank size of assets* to total assets of banking system. There are three groups:

- *Banks with 0-2 % of their activity. Banka e Bashkuar e Shqipërisë sh.a. (BBSH), Banka, Banka e Parë e Investimeve, Albania sh.a. (BPI). (all 3% of total banking system assets.*
- *The second group of banks has their assets 2 – 7% of total assets for the banking system. Alpha Albania sh.a. (BA), Banka Union sh.a. (BU), Banka Tirana sh.a. (BT), and Banka Amerikane e Investimeve sh.a. (BAI). Banks in this group have 27% of the banking system assets.*
- *The third group has the banks with assets over 7 % of total assets. National Commercial Bank sha, Banka Raiffeisen, Intesa San Paolo, Credins Bank sh.a.. Four banks are holding together 70% of total assets.*

The banking health (performance) is given from the increase on capital levels. Liquidity is at satisfactory levels. At the end of 2019 ratio Loans / Deposits for foreign exchange and ALL was 52 % and 46.1%.

At the end of 2019, total loans of the banking system were 582 billion ALL. The adequacy ratio for the capital was 18,2 %, which is over 12% of the regulators request.

2.1 Liquidity ratios

The studies for liquidity have received high attention from researchers from other countries, In Albania the liquidity has not too many studies. Pavla Vodova; Oriol Aspachs, Erlend Nier, Muriel Tiesset; Ritab Al-Khour; Allen N. Berger dhe Christa H.S. Bouëman; Jose Berrospide; Mohamed Aymen Ben Moussa; Ionica Munteanu; Aikaeli, have performed the analysis of several countries, and we are trying to apply their findings in Albanian Banking system.

The liquidity of a commercial bank is the ability to finance its liabilities that can include loans, investments, deposits, maturities for different bank business.

There are two main methods to evaluate: liquidity GAP and liquidity ratios, GAP is the difference of recent and future assets and liabilities. The liquidity ratios are prepared based on the balance sheet. They must control if the needs for liquidity are the best priced possibility for the deficit.

The ratio of total liquid assets to total assets L1 shows the bank capacity to meet all short-term liabilities.

$$L1 = \frac{\text{Liquid Assets}}{\sum \text{Assets}}$$

Equation 1 First ratio of liquidity

The liquidity ratio L2 is the ratio of liquid assets to liquid deposits and short term borrowing.

$$L2 = \frac{\text{Liquid Assets}}{\text{Deposits} + \text{short term borrowing. ja afatshkutwr}}$$

Equation 2 Second ratio of liquidity

Third ration L3 counts the share of loan to total assets.

$$L3 = \frac{\text{loans}}{\sum \text{total assets}}$$

Equation 1: Third liquidity ratio

The last ratio. L4 shows the liquid non-performing share liquid liabilities. The ratio shows the bank capability to absorb liquidity problems.

$$L4 = \frac{\text{Loans}}{\text{Deposits} + \text{short term borrowing}}$$

Equation 4: Forth liquidity ration.

L1 and L3 seem to have more clear relations with liquidity determinants, than P2 and L4. Both of them are ratios based in assets liquidity, while L2 and L4 are based on liabilities based liquidity (Bhati, Zoysa, & Jitaree, 2015)

There are groups considered as internal, external and internal as well as determinants of industry and these macroeconomic (Vodava, tseganesh, feleku). Internal factors can be controlled with their interventions and decisions. External factors can not be controlled as they depended on activities that support our economy, the problems stay at policies.

3. Research Methodology and models

This study aims to evaluate the impact of internal and external factors on the liquidity of Albanian banks. The population analysed are commercial banks (12 licenced) for a period 2009-2018, considering 11 independent variables (4 specific variables of banking industry and 3 macroeconomic variables). These variables created a database of 110 surveys.

The model specification includes the definition of dependent and explanatory variables that are included in the model as well as the expected relations as per signs and size of function parameters. The model we have studied is based in foreign literature studied from researchers (Vodova, 2011) në Ceki, (Tesfaye, 2012), (Belihu, 2018), (Delechat, Henao, Muthoora, & Vtyurina, 2014), (Aspachs, Nier, & Tiesset, 2005), (Trenca, Petria, & Corovei, 2015), (Trenca, Petria, Mutu, & Corovei, 2012), (Lastuvkova, 2015). Our target to meet objectives evaluates this model:

$$L_{i,t} = \alpha + \beta * X_{i,t} + \epsilon_{i,t}$$

Where:

$L_{i,t}$ – Dependent variable. Includes liquidity ratios: L1, L2, L3 and L4 of a bank for a certain time t;

α is a constant (intercept in econometrics);

β – is function's coefficient. This is for specific banking factors industry and macroeconomic factors;

$X_{i,t}$ - represents specific banking factors, industry specifics and macroeconomics of the bank i , during year t ;

$\epsilon_{i,t}$ – is the error term.

Empiric Models empirike: used in the study have to identify the factors that influence liquidity of commercial banks BT (measured with L1, L2, L3 and L4 ratios) are hereunder:

$$L1 = \alpha + \beta1(KAP_{i,t}) + \beta2(MADH_{i,t}) + \beta3(NPL_{i,t}) + \beta4(ROA_{i,t}) + \beta5(IRM_{i,t}) + \beta6(NIB_{i,t}) + \beta7(IRL_{i,t}) + \beta8(MIR_{i,t}) + \beta9(PBB_{i,t}) + \beta10(INF_{i,t}) + \beta11(NNP_{i,t}) + \epsilon_{i,t}$$

The equation – L1 liquidity ratio..

$$L2 = \alpha + \beta_1(KAP_i, t) + \beta_2(MADH_i, t) + \beta_3(NPL_i, t) + \beta_4(ROA_i, t) + \beta_5(IRM_i, t) + \beta_6(NIB_i, t) + \beta_7(IRL_i, t) + \beta_8(MIR_i, t) + \beta_9(PBB_i, t) + \beta_{10}(INF_i, t) + \beta_{11}(NNP_i, t) + \epsilon_{i, t}$$

The equation L2 of liquidityt.

Where:

L1, L2– are liquidity ratios , as dependent variables in the study;

α – intercept (constant term);

β – coefiiient of the functon for banking specific, industry and macroeconomic factors, përkatësisht, për faktorët respektively of industry and macroeconomics;

KAP – Shareholders capital/ total assets;

MADH – natyral logaritm of total assets;

NPL – Total non-performing loans/ total loans;

ROA – Net profit after tax / Total assets;

IRM – (IRL-IRD (loan’s interest rate- deposits interest rate));

NIB – Annual treasury bills yield;

IRL – Loan interest rate;

MIR – Weighted two weeks Repurchase Rat;

PBB – Annual growth of real GDP;

INF – Annual inflation rate;

NNP – annual unemployment rate ;

ϵ_{it} – error term .

4. Hypothesis

The hypothesis written to evaluate our model and banking system in Albania, are presented hereunder:

Study hypothesis	Testing objective
H ₀ : Specific banking factors does not influence on determination of commercial banks liquidity (L1, L2). H ₁ : At least one specific factor have impact determination of commercial banks liquidity	Main Hypothesis that expresses correlation of a commercial bank liquidity with specific banking variables.
H ₀ : $\beta_1=0$ Bank capital does not influence on determination of commercial banks liquidity (L1, L2). H ₁ : The bank capital influences on determination of commercial banks liquidity (L1, L2).	Correlation test of banking capital and liquidity.
H ₀ : $\beta_2=0$ Bank size does not influence on determination of commercial banks liquidity (L1, L2). H ₁ : Bank size influences on determination of commercial banks liquidity .	Correlation test of banking capital and liquidity. banking size and liquidity.
H ₀ : $\beta_3=0$ Non-performing loans does not influence on determination of commercial banks liquidity (L1, L2). H ₁ : Non-performing loans does influence on determination of commercial banks liquidity	Correlation test of nonperforming loans and liquidity.
H ₀ : $\beta_4=0$ Profitability does not influence on determination of commercial banks liquidity (L1, L2). H ₁ : Profitability influence on determination of commercial banks liquidity $\beta_4 \neq 0$	Correlation test of profitability and liquidity.
H ₀ : determination of commercial banks liquidity. does not influence on determination of commercial banks liquidity Të paktën një nga aktorët	Main hypothesis on correlation of industry factors and liquidity.

specific të industrisë ndikon në përcaktimin e likuiditetit të bankavë tregtare.	
H ₀ : β ₅ =0 Interest Rate Margin does not influence on determination of commercial banks liquidity H ₁ : β ₅ ≠0 Interest Rate Margin influence on determination of commercial banks liquidity	Correlation test of Interest Rate margin and liquidity.

5. The liquidity analysis for the third group of banks

The 3rd group of banks belongs to institutions that has their assets over 7% of the total banking system assets. Four banks registered as Banka Kombëtare Tregtare sh.a. (BKT), Banka Raiffeisen sh.a. (BR), Banka Credinsbank sh.a. (BC), and Banka Intesa Sanpaolo Albania sh.a. (BISP). The correlation matrix indicates positive correlation between L1, L2 with capital, bank size, unemployment rate, nonperforming loans, GDP and profitability. A negative impact is given on the correlation of L1 and L2 with inflation rate, loans interest rate, interest rate margin, REPO rate and Treasury bills rate. The models for 3rd group are:

The model shows the importance of bank capital to liquidity: Increase (decrease) of a unit banking capital, is expecting to have 1,327610 unit of capital. A positive impact belongs to treasury bill rates (7.556764). The negative impact is of REPO rate. The final Model is:

$$L1 = -0.530079 + 1.327610 * kap + 0.021281 * madh + 0.889459 * roa - 0.023742 * npl + 3.320571 * irl - 0.920734 * irm - 16.41579 * mir + 7.556764 * nib + 0.538197 * pbb + 0.829074 * nnp + 3.525395 * inf + e$$

Source: Author's calculation.

Based in this model evaluation we reconfirm the importance of banking capital on the determination of commercial banking liquidity. The positive impact of capital shows in the regression that every unit increase (decrease) of capital the liquidity is expected to increase (decrease) with 1.883187 units in liquidity. Also the treasury bills rate has a positive effect on the liquidity of commercial banks – an increase (decrease) on the yield of treasury bill is expected for an increase (decrease) with 8.254151 units in liquidity. The base interest rate of monetary policy has a negative impact, as for one unit increase (decrease) of Repurchase Rate, the liquidity is going to be lower (higher) with 17.91974 units. The other factors with less important impact, are on the positive correlat (MADH), ROA, NPL, IRL, NIB, NNP and INF, while in negative correlation variables MIR and Irm have a very little effect on liquidity. The final Model is:

$$L2 = -0.462610 + 1.883187 * kap + 0.017352 * madh + 1.045665 * roa + 0.154252 * npl + 3.295907 * irl - 17.91974 * mir - 0.997349 * irm + 8.254151 * nib + 0.118930 * pbb + 0.900927 * nnp + 4.714416 * inf + e$$

Final Model of L2 for 3v rd level commercial banks. .

5.1 Correlation Matrix.

The correlation between dependent variable with independent variables in the correlation Matrix explains that higher coefficient, means stronger correlation. While the correlation between independent variables shows that lower the coefficient is better for the model.

.The correlation matrix Source author's calculations

The correlation table, we find out that liquidity indicators does not have the same strength,with all variables we have analysed. We are expecting a positive correlation of liquidity ratio L1 and independent variable, as: bank capital (0.367171), profitability (0.026635), non-performing loans (0.012348) and natyral growth of unemployment (0.117386), While negative relation is verified for inflation,(-0.154824), loans interest rate (-0.212508), Treasury Bills yield, (-0.225569), GDP (0.001104), interest rate margin (-0.110887), monegtary policy base rate (-0.225569), bank size (-0.116568). L2 ratio has a strong correlation with banking capital (0.458174),profitability (0.012842) and natural ratio of unemployment (0.111972), negative correlation with variables "size" nonperforming loans and negative with size and , nonperforming loans Also from the table we can see that the liquidity ratios L1, L2 has strong correlation – almost perfect correlation with each other, (0.974820). This shows that two ratios are evaluating the liquidity in the proper way. (this means that we will consider on our study only first two liquidity ratios L1 and L2.

6. Findings and conclusions

Albanian banking have faced liquidity problems, mainly from non-performing loans, delayed repayments or riclasiffication of loans accompanied with creation of provisions and other reserves of liquidity. Reserve funds on the other side are correlated with performance because of expensed used for reserves. The Central Bank of Albania is allowing the use of required reserves up to 20 % of their holdings to commercial bank accounts. The second possibility to finance liquidity deficits are Repurchase agreements, open market operations and foreign exchange transactions.

The situation with liquidity problems because of non-performing loans, is improved and recently liquidity is turned to overfloat the demand for money from Albanian government and businesses.

Albanian researchers have been discussing the lack of alternatives offered from financial system. After more then three decades of market economy, we are still poor in different markets. These briefings reinforce the capital role on investment market and alternatives

To invest on secondary market of government securities.

The objective of this study was identification of liquidity determinants that affect Albanian banking system liquidity, as well as the size of this impact. The literature gives Three main groups of factors considering: specific banking determinants, specific factors of banking industry, and makroeconomic

determinants of liquidity. t. The previous studies explain banking liquidity as function of internal and external factors. Internal factors are related with bank accounts – explained as specific profitability factors. External factors are variables that do not deal with bank management, but reflect the economic framework with its effects on bank performance. The models are calculated on series 110 data series, using e-views, The study has shown some empiric findings: rike:

- The results has shown a positive strong correlation between bank capital and liquidity L1, L2) with statistical importance. The conclusion as result is matching expectations Përfundimi i nxjerrë si rezultat është në përputhje me pritjet e vlerësuar nga literatura e of literature studied (Al-Khour, 2012), (Vodova, 2011); (Chagwiza, 2014) (Tsfaye, 2012); (Belihu, 2018). (Heuvel, 2005).
- The results for a strong positive relation was explaining the correlation between independent variable ROA and elements of L1
- Other factors, taken into consideration, has shown non-important statistical impact on liquidity level. These factors are shown that bank size has a negative impact for liquidity. Other factors on our models were non-performing loans, interest rate margin, interbank market interest, Gross domestic Product, base rate of monetary policy, etc..

Abstract: Searching for information to better understand consumer behavior is a field of study with interest for researchers and businesses. The era in which we live in offers many opportunities for the use of technology while also enabling a change in the way products are delivered to the consumer. The purpose of this paper is to present through a literature review, the impact brought by the Covid-19 pandemic on the ability to better measure consumer behavior through online shopping.

Many consumers consider online shopping as a way of saving time in choosing and evaluating alternatives of products. This is also driven by increased internet use and increased familiarity with electronic devices. Is this behavior also observed in the case of online shopping for food products? Food products are a category of products which consumers are sensitive because they are directly related to consumer health. Online purchases of food products turned out to be a field of study where literature presents little empirical data. The Covid-19 pandemic due to closure and social distancing enabled the creation of a situation that favored online shopping. This paper aims to compare whether the presence of a global impact factor such as Covid-19 proves that online shopping will remain an important shopping alternative for the consumer. For this it should be considered by the business as a new trend of distribution channels for food products.

Keywords: Covid-19, food products, consumer behavior, online shopping, time saving, convenience.

Introduction

The development of technology has brought about a change in the way people live and work. Such a change is also observed in the role of the individual as a consumer in the market. Based on statistical data, the level of internet use by consumers has increased significantly. As of January 2021, it is estimated that there are 4.66 billion internet users worldwide or 59.5% of the world's population. From this figure it is estimated that 92.6% of the population access the internet via mobile phone (Statista, 2020).

This very large number of internet users turns out to be taking advantage of this opportunity to conclude an online purchase. This results from 0.16% to 2.77% by usage platforms. From this number of visitors it results that in the third quarter of 2021 the average value of online food orders ranged from 71.75\$ - 121.64\$ (Statista, 2020). Taking advantage of such an opportunity to make online purchases shows that consumers are looking at it as a very good opportunity to provide the products they need. An issue of interest is to know if this opportunity is an equally good alternative for consumers to buy food products. What impact is the experience of the Covid-19 pandemic situation bringing to this market?

As the literature suggests, the increase in online sales for different products has seen an increase over time, although not uniformly for all product categories (Anesbury et al., 2016). Online shopping for food products turns out to be a relatively new environment and the result is modest compared to other product categories. Yet they experienced steady growth throughout the world (EuroMonitor International, 2020).

In terms of distribution channel, the online purchase of food has seen a huge increase since the advent of Covid-19 (EuroMonitor International, 2020). This has been driven by restrictions that governments have placed on maintaining social distance. Under these circumstances created by Covid-19, some consumers may have had a first experience with online shopping and for others it may have been a repeat experience from a longer history.

Online shopping represents a new model of shopping that deserves to be analyzed for all types of products, in order to provide a convenient distribution channel for the customer. Distributors are also interested in better understanding consumer behavior even when it comes to online grocery shopping. Through this paper it is intended to bring to attention through the literature review about the fact that: Do consumers have similar behaviors in using online shopping for food products in terms of factors that motivate them to buy online? What impact could the Covid-19 situation have had as a situational factor in promoting the use of online food purchasing channels? Should we expect this behavior to continue even after the situation has changed and the world has regained its behavioral habits?

2. Saving time and convenience in shopping as motivator of online shopping

Many consumers cite time savings and convenience as their main motivation for buying food products online (Morganosky and Cude, 2000). They see online shopping as a way to save time in choosing and evaluating alternatives, coupled with increased internet usage and familiarity with electronic devices. At the end of 2019 the world faced the spread of the Covid-19 virus. Until then the data in the literature regarding online shopping, which were measured under normal living conditions, focused on identifying several factors that may motivate consumers to use marketing channels to buy their products online. According to Morganosky and Cude (2000), the key factors in choosing online channels through which they can buy products: time savings and convenience in purchasing.

2.1. Time saving

The literature provides information about the time the consumer spends on purchases in physical stores. Results from many authors suggest that more educated and somewhat higher-income consumers may be more likely to shop online, primarily for time-saving and convenience aspects. Hence they suggest that the online environment potentially reduces the amount of time required to shop (Bellman et al., 1999; Huang and Oppewal, 2006; Morganosky and Cude, 2000; Ramus and Nielsen, 2005; Sorensen, 2009). This is also reinforced by Richmond (1996) which shows that buyers shop online to save time and have more convenience (Richmond, 1996).

Various authors acknowledge that online shopping saves time compared to shopping in physical stores as it avoids movement, parking, and communication in a physical environment. The latter is of interest as reported by Hui et al., (2009) *“A considerable part of the time in the store does not go to the selection of goods, but is moving through the store.”*

Huang and Oppewal (2006) suggest that efforts to promote online food purchases may focus just as well on communicating the time savings from online purchases rather than reducing delivery tariffs. On the other hand, Anesbury et. al., (2016) estimate that the time of choosing online shopping for food products is fast, with an average of 19 seconds. They also point out that comparing the results of this online study with those conducted in-store shows that buyers behave in a similar way across the two purchasing methods (Anesbury et. Al., 2016). Considering the data it would be an interesting look at what has happened to this factor by studying the time spent online as a result of the impact of lifestyle in quarantine or social distance conditions as a result of Covid-19 which to some extent has pushed them consumers spend more time online.

According to Alaimo et al., (2020) who have measured the impact of the time factor as a result of Covid-19, suggest that the opportunity to save time by making online purchases is high and the chances of being more satisfied are 4,011 times more than those who state that this possibility is low, keeping all other variables constant.

2.2. Convenience

Convenience is also a motivating factor in online shopping. According to Aylott and Mitchell (1998); Cassill et al., (1997) the convention deals with psychological cost and other forms of non-monetary costs such as time, effort, and stress.

Morganosky and Cude (2000) also noted that convention was a particularly important motive when there were limitations of the situation such as: the state of health or the presence of young children in the family. This suggests that situational factors may be important in boosting and strengthening online shopping motivations. According to Zhuang et al., (2005) situation factors, such as physical and social surroundings, temporal perspectives and antecedent states can affect sales. As a result, the Covid-19 factor can be considered a situational factor. Factors such as: product or seller characteristics, product information but also the impact of the situation affect online shopping (Alaimo et al., (2020).

Online shopping offers various conveniences regarding home or office shopping. Morganosky and Cude (2000) even point out that consumers order a list for a period and send it when it is complete. Thus they are able to check the recipes or shelves for the products needed during the purchase, checking the execution of the order periodically, which is impossible or difficult to do when shopping in the store.

3. Adopting online shopping behavior after Covid 19

Based on the consumer decision-making process, knowing the post-purchase phase is of interest to understand whether consumers will repeat the experience of the purchase or the new form of purchase. According to Oliver (1977), Expectation Confirmation Theory (ECM) is the cognitive theory that aims to explain beliefs about post-purchase, or post-adoption, satisfaction as a function of purchasing expectations and perceived performance. Lee (2010) used an extension of ECM with information systems theory that models how users accept and apply a particular technology in an empirical model to explain and predict the purpose of user continuity in online learning.

Based on this model Shang and Wu (2017) suggest that the determinants that affect the continuity of online use by users may vary between different product categories. Shang and Wu (2017) explain that among food buyers, the intention of continuation, the adoption of this purchasing model is determined by several factors, such as:

- a. Perceived ease of use
- b. Pleasure
- c. Value for money
- d. Confirmation

Among these factors, it turns out that the value for money, which is the perceived usefulness derived from a purchase through an app as a cost function, affects the intention of continuation more than all other factors. So according to Shang and Wu (2017), the link between the tendency to buy food online and the value for money is high. Cost factors in the study of Shang and Wu (2017), are those related to the change in monetary cost perceived by consumers when comparing food purchases online and in stores. Purchasing costs include both fixed and variable costs. Bell et al., (1998) identify fixed costs as travel expenses associated with going to a store plus a buyer's natural preference and loyalty to the store. Travel expenses such as: fuel cost or parking are clearly an expense that consumers would like to get rid of. So online shopping saves monetary value for the consumer and consequently affects the tendency to continue online shopping.

Retailers expect online shopping to continue after restrictions are lifted, driven by social distancing as part of a new way of shopping. In the United States, for example, Amazon is adding 100,000 new positions to its distribution network including Amazon Fresh and Whole Foods (EuroMonitor International, 2020).

Situational factors like Covid-19 can be considered as incentives to push various customers who probably would not have been involved in online shopping. This situation can also affect the reduction of frequency after changing the initial conditions. Significantly, situational factors seem to have been important factors not only in initiating but also in reducing the frequency or complete cessation of online shopping for food products, especially when the initial situation returns to normal. (Hand et al. 2009).

From a managerial perspective, discovering the importance of situational factors as incentives for consumers to start (or stop) buying food products online is important (Hand et. al., 2009). This suggests that efforts to promote online food purchases may focus just as well, if not better, on communicating the time savings earned from online purchases than on reducing delivery tariffs (Huang and Oppewal, 2006).

For food buyer groups, marketing policy strategies can focus more on increasing customer value through promotions and rewards, among other strategies by increasing perceived profitability by the consumer. On the other hand online food providers should use simple platforms in use so that the consumer is easily oriented and encouraged to look at online shopping bargaining.

Conclusion

The level of internet use by the consumer has increased significantly. A very large number of internet users turn out to take advantage of this opportunity to conclude an online purchase. Online grocery shopping turns out to be a relatively new environment. As far as the distribution channel is concerned, online food purchases have seen a huge increase since the advent of Covid-19. Many consumers cite time savings and convenience as the main motivators for buying food products online.

The opportunity to save time by making online purchases is high and the chances of being more satisfied are greater than those who state that this opportunity is low. Value for money results as the main factor influencing the purpose of continuity.

Factors related to the change in the monetary cost perceived by consumers when comparing grocery shopping online and in stores as travel expenses associated with going to a store plus a buyer's natural preference and loyalty to the store. Travel expenses such as fuel or parking costs are clearly an expense that consumers would want to get rid of. So online shopping saves money for the consumer and therefore influences the tendency to continue them. Online food providers need to focus on improving factors that save time and increase consumer convenience so that online shopping is an alternative to securing products.

Abstract: This article presents the business evaluation methodology and results for the largest restaurant chain in Bulgaria "Happy Bar & Grill" in conditions of COVID 19 pandemic. The approaches that are used and applied in business evaluation in the entertainment and restaurant business by experts in developed economic countries are often inapplicable in Bulgaria, for reasons discussed below. The method of discounted cash flows and the Guideline publicly traded company method are used. They are applicable in the Bulgarian conditions when evaluating existing restaurants and may reflect the effect of the COVID-19 pandemic.

Key words: business valuation, restaurant chain, guideline publicly traded company method, method of discounted future cash flows.

1. Introduction

Evaluating investments in the restaurant sector poses serious challenges to the scientific community and corporate management. The approaches used and applied in business valuation in the entertainment and restaurant business by experts in developed economic countries are often inapplicable in Bulgaria. The main reasons can be summarized as follows:

- the lack of reliable accounting data;
- the lack of a developed capital market;
- the lack of reliable and detailed historical data;
- observed significant heterogeneity and specificity in the business models (family restaurants, gourmet restaurants, franchise chains, specialized restaurants, luxury restaurants, part of a hotel complex, international chains, resort, seasonal, etc.);
- high degree of business risk (additionally in conditions of COVID 19 pandemic)

The purpose of this manuscript is to evaluate the largest chain of restaurants in Bulgaria. Currently, this is "Happy Bar & Grill", established in 1994 and originally emerged as a family restaurant in Varna. Today, Happy Bar & Grill is an international restaurant chain in three European countries, continuing to grow. Currently, the chain includes: 23 restaurants in Bulgaria, 3 in Spain and 1 in England.

The selected restaurant chain - "Happy Bar & Grill" will be evaluated by two different modern methods, which are applicable in Bulgarian conditions in the evaluation of existing restaurants and reflect the effect of the COVID-19 pandemic. The reasons for choosing these two methods can be summarized in:

The Guideline publicly traded company method is mandatory for the United States and most Anglo-Saxon countries and is used by investment bankers to verify the results obtained using the discounted cash flow method.¹

A significant number of financial authorities define the discounted cash flow method as "fundamentally sound and widely accepted as the most accurate valuation method. The DCF method is evolving as the

¹ Kasarova V., Business Valuation, Manuscript deposited in CNTB №168 / 2008, p. 92

best practice for valuing the assets of economic operators in the 1970s, and gradually one of its versions has become the standard."².

In addition, the selection criteria for the two methods mentioned above stem from the following considerations:

- ❖ availability of relevant financial and statistical data;
- ❖ applicability in the Bulgarian economic conditions;
- ❖ calculation of the effect of the COVID-19 pandemic and the subsequent lockdown.
- ❖ used on various business valuation algorithms;
- ❖ recommendations of modern leading experts in the field of investment valuations.

2. Data and methodology

Guideline publicly traded company method is classified in the group of market approach and is considered suitable for business valuation of structures in the restaurant business. This method is based on the idea that a firm can be valued using financial data about its competitors, called analogues. The business valuation of the valued company is determined on the basis of official public data for joint stock companies similar to the valued company. Table 1 presents stock exchange data for six US restaurant chains that were used as analogues.

Table 1: Stock market data for restaurant chains used as analogues³

An analog company	Share price	Market capitalization	Company value (EV)
	(\$ / share)	(\$ million)	(\$ million)
Fiesta Restaurant Group, Inc.	12,48	321,936	380,094
Carrols Restaurant Group, Inc.	6,85	356,827	1 077,381
J. Alexander's Holdings, Inc.	7,10	106,998	241,827
Nathan's Famous, Inc.	59,68	245,044	-70,285
Ruth's Hospitality Group, Inc.	16,28	561,885	246,723
BJ's Restaurants, Inc.	32,66	723,511	701,18

The servers of the world's largest electronic exchange NASDAQ and one of the largest web service providers YAHOO were used as the primary sources of stock exchange and financial data. The selected comparable joint stock companies are selected on the basis of a number of criteria such as: economic sector, asset size, asset growth, key financial indicators, business structure and etc.

Table 2: Financial data for a chain of American restaurants as of 12.2019, used as analogues⁴

An analog company	sales revenue	normalized EBITDA	gross profit	normalized net profit
	(\$ million)	(\$ million)	(\$ million)	(\$ million)
Fiesta Restaurant Group, Inc.	660,943	49,06	226,507	-13,502
Carrols Restaurant Group, Inc.	1 462,765	69,495	545,518	-23,939
J. Alexander's Holdings, Inc.	247,269	22,366	91,026	9,913

²Luehrman, T. What is it worth: A general manager's guide to valuation. Harvard business review, 1997 p. 139

³ www.nasdaq.com/market-activity/stocks

⁴ <https://finance.yahoo.com/quote>

Nathan's Famous, Inc.	101,849	30,237	43,039	13,323
Ruth's Hospitality Group, Inc.	468,026	73,93	125,714	42,206
BJ's Restaurants, Inc.	1161,45	128,849	185,688	49,011

The method of public market comparisons relies on business valuation based on market multipliers calculated from a certain sample of similar comparable publicly traded companies in the respective sector. Market multipliers are obtained as the ratio between the Enterprise value of an analogous company (EV) to a certain financial indicator (EBITDA, sales, gross revenue, gross profit, etc.), ie. each market multiplier is determined by the following formula:

$$\text{Market multiplier} = \frac{\text{Enterprise value of an analog}}{\text{financial indicator}}$$

Discounted future cash flow method, as mentioned earlier, has become a mandatory standard in the valuation practice of most countries in its version that the value of a business object is equal to the expected future cash flows, discounted to the present value through WACC or the CAPM model.⁵

The leverage method will be used in the evaluation of "Happy Bar & Grill". The reasons for this choice is that it is the only possible application in the evaluation of the restaurant business in Bulgaria, because there are no restaurants listed on the stock exchange. The basic idea with this version of the DCF model is that the value of a business is entirely a function of its future cash flows. Thus, the first challenge in building a DCF model is to predict the future cash flows business is generating.

Accurate forecasting for the next few years is a challenge for academics, and different forecasting approaches are currently used in financial practice, depending on the specific behavior of the timeline.

Table 3 shows the set forecast values as a percentage of the total gross sales revenue for 2019.

Table 3: Forecasting income and expenditure cash flows

Gross revenue by category:	2020	2021	2022	2023	2024
sales from restaurants:	65%	68%	105%	103%	103%
food for home	203%	215%	85%	108%	108%
revenue from franchise agreements:	100%	100%	100%	103%	103%
sales for institutions:	246%	258%	90%	107%	107%
commission from other products:	87%	87%	92%	103%	103%
Costs by category:					
total commissions:	0.39%	0.40%	0.43%	0.43%	0.43%
fees and refunds	0.40%	0.40%	0.40%	0.40%	0.40%
operating costs:	84,07%	87,04%	84,07%	87,04%	84,07%
Impairment and depreciation:	11.37%	11.37%	11.37%	11.37%	11.37%

In this case, due to the crisis in the restaurant sector caused by Covid 19, there is no typical trend model, but a sharp decline in income is expected for 2020, to a lesser extent in 2021 and recovery and growth over the next three years. For these reasons, a hybrid approach between sales percentage and expert evaluation was chosen as the forecasting method.

Table 4 shows the specific estimates for expected revenues and expenditures for the next five years.

⁵Luehrman T., What is it worth: A general manager guide s guide to valuation. Harvard business review ,. May / June 1997 p.132-142

Table 4: Estimated values of income and expenditure cash flows in thousand BGN

Gross revenue by category:	Average values for the last 5 years	2020	2021	2022	2023	2024
sales from restaurants:	112483,637	77 920,458	81 516,787	125 871,509	123 659,619	123 659,619
food for home	119,683	296,596	314,129	124,191	157,883	157,883
revenue from franchise agreements:	639,062	690,826	690,826	690,826	711,778	711,778
sales for institutions:	552,381	1 587,391	1 664,824	580,753	693,588	693,588
commission from other products:	136,487	126,566	126,566	133,840	149,518	149,518
Total gross income	113931,2488	80621,8 37	84313,1 33	127401, 119	125372, 386	125372, 386

Calculating free cash flow without leverage (UFCF) is the next step in the discounted cash flow model.

Table 5: Estimated values of the income statement in thousand BGN

forecast indicator	average values for the last 5 years	2020	2021	2022	2023	2024
gross profit:	13 825,036	12 209,684	10 249,755	19 243,160	15 203,622	18 936,732

free cash flow without leverage (UFCF)	12 345,207	7 699,912	6 065,163	18 759,777	14 589,135	17 637,178
% discount (WACC)		24,94%	24,94%	24,94%	24,94%	24,94%
PV of UFCFs		6 162,805	3 885,329	9 618,463	5 986,876	5 792,852

Table 6 presents the key indicators for the corporate management of Happy Bar & Grill "based on financial analysis" for the period 2020 - 2024.

Table 6: Financial analysis of main forecast indicators

forecast indicator	average values for the last 5 years	2020	2021	2022	2023	2024
change in gross revenue:	3.18%	-33.6%	4.6%	51.1%	-1.6%	0.0%
operating margin:	12.05%	15.1%	12.2%	15.1%	12.1%	15.1%
EBITDA margin:	23,43%	26.5%	23.5%	26.5%	23.5%	26.5%
net margin:	10.85%	13.6%	10.9%	13.6%	10.9%	13.6%

The financial analysis of the forecast indicators shows that as a result of the introduced lockdown a decline in gross revenues is expected by a total of 33.6% in 2020 and followed by a slow recovery of 4.6% in 2021.

3. Results

Table 7 presents the calculated market multipliers EV/Sales, EV/EBITDA, EV/GP and P/E for each of the sampled analog companies. In order to analyze and increase the accuracy of the model for each market multiplier, certain indicators of descriptive statistics are calculated.

Table 7: Calculation of market multipliers

An analog company	EV / Sales	EV / EBITDA	EV / GP	P / E
Fiesta Restaurant Group, Inc.	0.57508x	7.74753x	1,67807x	-23.84358x

Min	-0.69009x	-2,32447x	-1.63305x	-23.84358x

The applied discount rates for liquidity, which are used in developed economic countries in business valuation of private non-joint-stock companies (which are 100% of the restaurants in Bulgaria) usually vary between 20 - 30%, but in our conditions would sometimes be appropriate and more -high values. Lack of liquidity can reduce the value of private companies by as much as 50%, as there is no criterion for daily evaluation, similar to publicly traded companies on the relevant stock exchange. There are many factors that go into determining the discount rate used to adjust liquidity risk. In this case, the criteria used are: asset size, operating history, revenue quality, product business mix, form of management, business organization, business risks and more.

Table 8 presents the adjusted market multipliers with a selected liquidity discount rate of 30%.

Table 8: Discounting of market multipliers with the liquidity percentage

discount% for liquidity	EV / Sales	EV / EBITDA	EV / GP	P / E
30%	0.40255x	5,42327x	1,17465x	-16.69051x
30%	0.51558x	10,85210x	1,38248x	-10.43397x
30%	0.68459x	7,56858x	1,85968x	7,55559x
30%	-0.48306x	-1,62713x	-1.14314x	12,87479x
30%	0.36901x	2.33608x	1,37380x	9,31904x
30%	0.42260x	3,80931x	2,64328x	10,33355x
Max	0.68459x	10,85210x	2,64328x	12,87479x
75th centile	0.49233x	7,03225x	1,74038x	10.07992x
Average	0.31854x	4.72704x	1,21512x	2,15975x
Median	0.41258x	4,61629x	1,37814x	8,43732x
25th centile	0.37740x	2,70438x	1,22444x	-5.93658x
Min	-0.48306x	-1,62713x	-1.14314x	-16.69051x

When using foreign analogue companies, the calculated market multipliers need to be adjusted with an indicator reflecting the difference in political risk between the two countries. Political risk is assessed by credit rating agencies specializing in risk companies and others. Different companies calculating political risk use different approaches and scales to scale the risk.

Table 9 presents Bulgaria's assessment of the political risk at the end of 2020 made by the international company MARSH, which specializes in measuring global risks.

Table 9: Bulgaria political risk by components⁶

Political risk index:	64.40
Operational risk index	61.8
Long-term political risk index	72
Short-term political risk index	65.2
Long-term economic risk index	64.1
Short-term economic risk index	61.5

Table 10 presents the US assessment of the political risk at the end of 2020 made by MARSH.

Table 10: US political risk by components⁷

Political risk index	77.6
Operational risk index	77.9
Long-term political risk index	82.6
Short-term political risk index	80
Long-term economic risk index	78.9
Short-term economic risk index	68.5

The political risk adjustment is calculated as the ratio between the political risk index in the United States and the political risk index in Bulgaria, ie. $77.6:64.40 = 1.204968944$.

Table 11 presents the adjusted market multipliers with the political risk differential in both countries.

Table 11: Adjustment of market multipliers with political risk

⁷ there again

The next step in the market multiplier method algorithm requires calculating the firm's market value according to each of the multipliers used.

$$EV = \text{Sales} * EV / S = 121\,505,319 \text{ thousand BGN} * 0,342 = 41\,602,903 \text{ thousand BGN}$$

$$EV = \text{Sales} * EV / \text{EBITDA} = 31763,676 * 3,831 = 121\,688,135 \text{ thousand BGN.}$$

$$EV = \text{Sales} * EV / \text{GP} = 18424,45896 * 1,144 = 21,072,312 \text{ thousand BGN}$$

The valuation of "Happy Bar & Grill" according to the method of public market comparisons amounts to:

$$EV = \frac{[41\,602,903 + 121\,688,135 + 21\,072,312]}{3} = 61\,454,450 \text{ thousand BGN}$$

The main disadvantage of this method of business valuation is that there is a subjective difficulty in determining the correct market analogues of joint stock companies. It is very rare to find two identical private companies and this requires experience and routine from the analyst performing the assessment.

Discounted future cash flow method

The next step of the DCF model is to determine the appropriate discount rate. In "Happy Bar & Grill" evaluation will be used as a discount rate the weighted average cost of capital (WACC) of the firm. The reason for this decision is that it is difficult to apply the CAMP model, because although the sole proprietorship "Happy Bar & Grill" is not listed on the stock exchange.

WACC for companies that are not listed on stock exchanges, accepting only debt and equity is as follows:

$$WACC = (Re \times We) + (Rd \times [1 - \text{tax}] \times Wd) \text{ where:}$$

WACC is the weighted average cost of capital;

Re - the costs for SC in percentage;

We - the weight of SC in the capital structure of the business;

Rd - the percentage of external debt costs;

Wd - the weight of long-term debt in the capital structure of the enterprise;

tax - the amount of the marginal corporate tax.

The percentage cost of SC is apt to be calculated as the return on equity (ROE) or in this case Re is found as:

$$Re = \frac{ANP}{AE} \cdot 100 = \frac{12\,442,532}{32\,136,944} \cdot 100 = 38,72\%,$$

where: ANP is the average net profit for the last 5 years;

AE is the average value of SC for the last 5 years.

The weight of SC in the capital structure of the company is found as the ratio of the average value of SC (AE) for the last five years to the average balance number - AA (average value of assets / liabilities) for the last five years, ie.

$$We = \frac{AE}{AA} \cdot 100 = \frac{32\,136,944}{82\,871,783} \cdot 100 = 38,779\%.$$

The value of external debt costs as a percentage is calculated as the ratio of the average value of financial costs (AFC) to the average value of long-term liabilities (ALL) or

$$Rd = \frac{AFC}{ALL} \cdot 100 = \frac{4419,249}{24527,405} \cdot 100 = 18,02\%.$$

The weight of the long-term debt (Wd) in the capital structure of the company was found by subtracting the weight of SC from 100% of the value of all liabilities, ie. 100% - 38.78% = 61.22%.

We already have data to calculate the weighted average cost of capital, which is calculated according to the formula referred to above:

$$\begin{aligned} \text{WACC} &= (\text{Re} \times \text{We}) + (\text{Rd} \times [1 - \text{tax}] \times \text{Wd}) = \\ &= (38.72\% \times 38.78\%) + (18.02\% \times [1 - 10\%] \times 61.22\%) = 24.94\% \end{aligned}$$

This is the percentage they will be discounted the expected income from the future activity of "Happy Bar & Grill".

The next step is to find the present value of leverage-free cash flows (PVCF). As explained in more detail in Chapter Two, it is calculated by the following formula:

$$PVCF = \frac{UFCF_1}{(1 + WACC)^1} + \frac{UFCF_2}{(1 + WACC)^2} + \frac{UFCF_3}{(1 + WACC)^3} + \dots + \frac{UFCF_n}{(1 + WACC)^n}$$

or specifically for "Happy Bar & Grill" you get:

$$\begin{aligned} PVCF &= \frac{7\,699,912}{(1 + 0,2494)^1} + \frac{6\,065,163}{(1 + 0,2494)^2} + \frac{18\,759,777}{(1 + 0,2494)^3} + \frac{14\,589,135}{(1 + 0,2494)^4} \\ &\quad + \frac{17\,637,178}{(1 + 0,2494)^5} = 31\,446,326 \text{ хил. лв} \end{aligned}$$

The next step in the algorithm of the DCF model is to find the terminal value of the enterprise (TV). It can be determined by several different methods, the final business valuation of which should not differ widely. In this case, Gordon's model for increasing perpetuate and initial pricing through a market multiplier will be used.

First the business value of "Happy Bar & Grill" will be calculated by Gordon's model of growing perpetuality. The formula is as follows:

$$TV = \frac{UFCF_n(1 + g)}{WACC - g}$$

Before substituting in the formula it is necessary to calculate the projected growth (*g*) of free cash flows without leverage on an annual basis. Specifically in this case the projected growth of *UFCF* is defined as the average growth rate of gross income and calculated at 3.18% on an annual basis

From here for the terminal value of "Happy Bar & Grill" we get:

$$TV = \frac{17\,637,178 (1+0,0318)}{0,2494-0,0318} = 27,464,753 \text{ thousand BGN}$$

The enterprise value (EV) of "Happy Bar & Grill" calculated using Gordon's model will be equal to the sum of the present value of free cash flows without leverage (PVCF) and the present value of the terminal value of the enterprise (PVTV) or:

$$EV = PVCF + PVTV = PVCF + \frac{TV}{(1+WACC)^n}$$

$$31\,446,326 + 27\,464,753 = 58,911,079 \text{ thousand BGN}$$

If we use the method of initial pricing by market multiplier, the terminal value will be equal to the estimated value of EBITDA for the fifth year multiplied by the market multiplier EV / EBITDA or:

$$TV = \text{EBITDA} \times \text{EV} / \text{EBITDA} = 33\,188,001 \times 2,736 = 90,817,638 \text{ thousand BGN}$$

Accordingly, the current value of the terminal value will be: =

$$PVTV = \frac{TV}{(1+WACC)^n} = \frac{90\,817,638}{(1+0,2494)^5} = 29,828,648 \text{ thousand BGN}$$

$$EV = PVCF + PVTV = 31\,446,326 + 29\,828,648 = 61,274,974 \text{ thousand BGN}$$

4. Conclusion

The main problems that prevent the effective application of modern precise methods of business valuation in the restaurant sector in Bulgaria are related to the lack of reliable accounting data, the lack of developed capital market, the lack of reliable and detailed public statistics and the public traded companies in the sector.

In terms of business valuation using the DCF method, accurate forecasting for the next few years is key to accuracy and a challenge for academia. Currently, different approaches are used in financial practice to forecast key variables depending on the specific behavior of the timeline, which are not applicable in the event of catastrophic events such as Covid 19. From the point of view of business objectivity, it is important to combine income methods with those from the market approach group.

The present study could serve as a basis for creating a methodology and recommendations for business evaluating in the entertainment and restaurant sector in Bulgaria.

In summary, a reliable investment assessment combined with an accurate quantitative assessment of business risk in the restaurant business in Bulgaria can help increase investment interest, improve financial management and significantly reduce the bankruptcies of companies in the sector.

Entrepreneurship in times of Covid-19. Which are the relevant challenges and opportunities? The case of Greece

Georgios Karapanagiotidis¹

Christos Nikas²

¹ Phd candidate, University of Macedonia, georgekaras24@hotmail.com

² Professor, University of Macedonia, xnikas@uom.edu.gr

Abstract: This paper aims to give an account of the situation during the first nationwide lockdown against the Covid-19 lockdown which occurred in Greece from March till May 2020. The paper builds on the insights acquired from entrepreneurs of SMEs in Northern Greece concerning the impacts on their entrepreneurship activities. Impacts are examined for both women and men entrepreneurs. Also, entrepreneurs' views regarding their outlook beyond the lockdown concerning job creation and entrepreneurship opportunities. The study's findings focus on possible long-term trends for the post-Covid economy concerning an expected increased awareness of personal wellbeing and business resilience and the perceived consequences.

Keywords: nationwide lockdown against the Covid-19 lockdown, entrepreneurs, SMEs, Post-COVID economy, IPA.

Introduction

The COVID-19 lockdown poses major challenges for people, governments and institutions around the world. But despite all the privations and losses, the COVID-19 crisis also offers the opportunity to look at the global and almost simultaneous experiences with the lockdown together and to develop solutions for the future.

The COVID-19 crisis as a catalyst

The COVID-19 crisis could be a catalyst for a development that was already triggered by the economic and financial crisis and the changes in the world of work associated with digitization. Suddenly the economy came to a standstill, and theoretical questions about the future turned into practical and urgent challenges. If we wish to be serious about the fact that economic globalization in the sense of sustainable economic growth must be followed by social globalization, and if we have recognized that viruses and financial or social upheavals do not stop at borders, then now is the time to harness the momentum generated by the COVID-19 lockdown.

Greek economy in times of the pandemic of COVID-19

The Greek economy, despite the long period of adjustment it suffered in the 10-year crisis, failed to solve its structural pathogens. Greece's economic model remained weak, creating negative expectations about the effects the pandemic would have on the domestic economy. Greece's heavy dependence on tourism and catering made the economy particularly vulnerable to the pandemic which directly and drastically affected these sectors. At the same time, a significant structural weakness is the high consumption as a percentage of GDP that over time exceeds the European average by at least 20 percentage points.

The Greek economy, despite the long period of adjustment it suffered in the 10-year crisis, failed to solve its structural pathogens. Greece's economic model remained weak, creating negative expectations about the effects the pandemic would have on the domestic economy. At the same time, the Greek economy is characterized by a low degree of digitization both in terms of the state and companies. According to the Digital Economy and Society Index (DESI), Greece ranks second to last (27th) (European Commission, 2021) among EU countries, reflecting the low level of use of broader technology solutions and especially the low penetration of e-commerce and e-banking that was a trend before the pandemic. In addition, the small size of Greek companies traps them in a

regime of low productivity and introversion and significantly limits their ability to raise liquidity, invest and innovate. These inherent characteristics, which over time have been an obstacle to the growth of entrepreneurship, have heightened concerns about the impact that the economy as a whole would receive due to the pandemic (ΕΛ.ΣΤΑΤ., 2021).

The outbreak of the pandemic brought to the surface again the structural weaknesses of the Greek economy, such as the great dependence on the service sector and especially the sectors of tourism and catering. The Greek economy in order to stand on its own two feet is called upon to build a new productive model with stronger foundations, proceeding with changes in its productive base. In this direction, the country should focus on strengthening industries that are more resilient to cyclical changes in the economy, such as manufacturing. The low level of investment during the crisis years, especially in the fields of technological upgrading and research & development, as well as the orientation of Greek companies in the domestic market, limit their ability to compete internationally. The increase of the added value of the Greek products, through the innovation and the emphasis on the connection with the identity of the country (branding) is the capable and necessary condition for the strengthening of the international competitiveness and the increase of the Greek exports. The Greek tourist product is characterized by massiveness and seasonality as the tourist flows are particularly dense at certain time of the year. Greece is called upon to upgrade its tourism product by investing in less seasonal and more quality forms of tourism, such as conference and medical tourism.

Tools and Methods

The sample consisted of 190 men and women entrepreneurs who responded willingly to a questionnaire distributed through the Google Forms software. From the analysis of the questionnaire. The entrepreneurs were based in the Attiki prefecture or outside of it. The data acquired were analyzed by the researchers.

Findings

How entrepreneurs were affected by the lockdown

A staggering 70 per cent of entrepreneurs report that the very existence of their business was under threat due to a significant decrease in trading activities. This means that in our sample alone, the jobs of 133 entrepreneurs and their 495 employees are at risk. Entrepreneurs frequently struggled with cancelled or postponed orders, receiving payments, found it challenging to pay suppliers and their business's running costs. So far only a minority (9 per cent) of SME employers were forced to lay off staff. The COVID-19 virus Job Retention Scheme launched by the government temporarily helped mitigate job losses in three out of four (about 75 per cent) of SME employers in our sample having applied for it. Companies established after 2019 could not benefit from the Scheme as they could not demonstrate a two-year-plus revenue track record.

How entrepreneurs reacted to the lockdown

Entrepreneurs are known for their agility and this was confirmed during the Covid-19 lockdown: 63 per cent of entrepreneurs who participated in this study adapted their plans for the business (about half by Mid-March). Nearly five out of six of entrepreneurs applied for government support. Almost one third of the entrepreneurs were able to capture new business opportunities during the lockdown by developing new products and services (mainly in the online market), others reviewed business practices or repositioned their businesses entirely. Many entrepreneurs boosted existing digital and online capabilities; others started to cater for the healthcare COVID related market of masks, disinfectants, sanitizing liquids, etc.

Given how entrepreneurs and their businesses are intertwined, the strain the lockdown had on their businesses considerably impacted entrepreneurs' mental wellbeing. Their life satisfaction and perceived stress worsened during the crisis. Many entrepreneurs started working from home with over two in three working solely from home or working more from home. In combination with childcare (due to schools and nurseries being closed), this added pressure to over three in five of the respondents. Even though for most the survival of their business was at stake, one in three

volunteered their personal time, and about half of entrepreneurs volunteered their business' services/products for good causes (helping other businesses, charities, or public workers).

Long-term opportunities and realities

Entrepreneurs looked to the future with confidence with nearly half of them seeing their business surviving the crisis eventually and one in three expecting their business to be even larger than pre-lockdown. Fifty per cent of entrepreneurs expected to add employees to their business over the next five years. Past research indicates that such expectations are a good predictor of employment growth over time. Entrepreneurs also anticipated an acceleration of their existing business, often tied to online services. Many expect cost savings due to increased remote working, others are reviewing their business offerings and the business model itself. Many see opportunities related to a shift in customer behaviours due to the lockdown. Despite this optimism, many entrepreneurs are in a precarious position : only one third were planning for the next 12 months and almost half of them predicted that they would run out of money within the next 12 months if the current situation continued. Regarding the impacts on women and men entrepreneurs, there were few pre-crisis differences in the businesses led by women and men, the former tended to be somewhat smaller, though of similar age and profitability. Women-led businesses were impacted less adversely than those of men with 65 per cent (vs. 70 per cent) seeing their businesses experiencing lower trading volume. While their perception of the long-term positive effects of the lockdown was similar to men's; women perceived fewer long-term opportunities and were less likely to expect their businesses to grow post lockdown. With respect to wellbeing, men and women entrepreneurs experienced similar drops in life satisfaction. Yet women entrepreneurs experienced less stress – likely due to their businesses being less adversely affected. Women more so than men entrepreneurs volunteered their business' offerings to support charities (50 vs. 42 per cent for men) or good causes. Entrepreneurs of businesses based in and outside of Attiki vs. outside of Attiki had more employees, were younger and less likely to be profitable although they had been similar in size before the lockdown. Attiki-based entrepreneurs saw a greater reduction of trading than entrepreneurs residing in the rest of the country. Yet, all entrepreneurs shared a similarly optimistic outlook in the short and long-term. Attiki - based entrepreneurs even tended to expect more net job growth over the next five years. The life satisfaction of entrepreneurs outside of Attiki suffered less than that of the Attiki-based entrepreneurs. Nevertheless, all entrepreneurs experienced increases in stress. Working from home is a new feature for many Attiki-based entrepreneurs – while entrepreneurs outside of Attiki were mostly not obliged to work from home.

Conclusion

The unifying element that all society is confronted with which is the same problems in the described subject areas at the same time and the fact that we have taken amazingly consistent measures in the most varied of countries, should now be used to jointly develop effective and accepted solutions for the future across borders. The chance for such solutions to be accepted has seldom been better. Because there is hardly any room for instruction, there is no information or experience advantage. The COVID-19 crisis also opens up the opportunity to overcome the consideration of economic development. Various studies show how, for example, accident insurance benefits in the form of prevention and professional reintegration can contribute to sustainable economic growth, which in turn has an impact on the financial stability and performance of the social systems (International Social Security Association, 2017).

In this context, our study paints a picture of short- and long-term opportunities but also vulnerability of SMEs and entrepreneurs in the Covid-19 lockdown. Many face real challenges to sustain their business going forward. Building on the insights from the study we reflect on five trends for the post-Covid economy and on targeted support measures to help Greek SMEs thrive.

Two cross-cutting general trends relate to (1) Personal resilience: an increased awareness of mental wellbeing, both for entrepreneurs and staff (eg related to increased working from home), and as a business opportunity, and (2) Business resilience including developing capabilities to be agile and most of all to spot and exploit new opportunities.

Three specific trends concern (a) Accelerated digitalization; (b) A move from global to local supply chains, and (c) Inclusive and social business models. Greek SMEs and entrepreneurs hold much potential to help rebuild a better, more inclusive and greener post-Covid Greek economy. In all of these trends the state is more than evidently absent, nevertheless, urgently needed. Further study is needed to investigate the ways that the state could be an active agent in the process of the post-COVID era.

Definition Of Innovation – A Quantitative Research

Gergő Sándorfi¹

Béla Pataki²

¹ Ph.D. student, sandorfi.gergo.almos@gtk.bme.hu, ORCID:

Abstract: The main objective of this paper is to show the importance of properly defining the term “innovation”. The underlying cause of the problem lies in the definition of “technology management” and “technology” itself. There are two types of these definitions: the narrow and the broad types. The narrow ones only refer to the forprofit, the business sector, while the broad ones refer to any kind of organizations, including forprofit, nonprofit and governmental organizations. According to the latest studies, the broad types of definitions are recommended. This is important because by narrowing down the scope of the definitions suggests that the nonprofits and governmental organizations do not have to be interested in the management of technology and innovation, but evidently, they use technologies; therefore, they have to manage it and be aware of how to innovate.

This paper shows quantitative research on how different authors use and define “innovation”. The search terms were “innovation, definition” in the Scopus database, in the subject area of Business, Management and Accounting, limited to articles and the keywords Innovation. The number of the articles in question was 329. Amongst these relevant were 195, used the concept of innovation in a broad sense 62, what is 31,8%, and used it in narrowed sense 133, what is 68,2%. Our study recommends using the broad type when defining management of technology and defining innovation.

Keywords: innovation; strategic management; management of technology

1. INTRODUCTION

Several definitions of ‘technology’ and ‘technology management’ have been published. These definitions sometimes mean different things. In this study, we are focusing on the different scope of these definitions. There are narrow and broad scoped definitions: the narrow ones are referring only for the business sector, while the broad ones are focusing on every kind of organization, including governmental and nonprofit organizations. This dichotomy is also standing for the definitions of innovation.

This research area has two levels:

- a theoretical-conceptual level,
- and a methodological, related to tools and techniques.

This study refers to the theoretical-conceptual level of the problem, added with qualitative research. Our aim is not to cite as many definitions as we can, but to show the typical examples of it and then expound the quantitative analysis on the definitions of innovation in the literature.

2. DIFFERENT TYPE OF THE DEFINITIONS

2.1 Different type of ‘technology’ definitions

There are several definitions for ‘technology’. A few of them refer to any kind of organization; most of them consider only the business sector. Let us cite some examples!

“Technology can be described in different ways:

Technology is the means for accomplishing a task—it includes whatever is needed to convert resources into products or services.

Technology includes the knowledge and resources that are required to achieve an objective.

Technology is the body of scientific and engineering knowledge which can be applied in the design of products and/or processes or in the search for new knowledge.” (Gaynor, 1996)

“Technology refers to the theoretical and practical knowledge, skills, and artifacts that can be used to develop products and services as well as their production and delivery systems. Technology can be embodied in people, materials, cognitive and physical processes, plant, equipment, and tools.” (Burgelman, Christensen, Wheelwright, 2008)

“... the role of technology is taken to be the application of scientific knowledge for the generation of improvements in, and benefits from, the societal subsystems, individually and collectively.” (Lock, 1975)

These definitions above mean quite different things, but they have the same scope: these definitions all refer to any organization; the scope is not being narrowed down only for the business sector.

The following examples have a narrowed business scope:

“By technology I mean several things. In some cases it’s a specific process that produces a specific product. In this case it’s hard to distinguish the product from the technology. More broadly, technology can mean a manufacturing process. [...] We can think of technology even more broadly as the way a company does business or attempts a task.” (Foster, 1986)

The next definition starts with a broad scope then narrows it down to business enterprises: “In fact, one short and arguably valid definition of technology is ‘knowledge of how to do things.’ A somewhat more extended definition, and the one that will underline all of this discussion, is that technology is ‘the system by which a society satisfies its needs and desires.’ [...] When applied to an individual enterprise, it means the capability that an enterprise needs in order to provide its customers with the goods and the services it proposes to offer, both now and in the future. [...] Since ‘knowledge of how to do things’ is the foundation from which a business satisfies the needs of customers, the choice of technology strongly influences the basic structure of the business. It is so intimately entwined with the very concept of an enterprise that one must consider them together. An enterprise with no technology is a virtually meaningless concept”. (Steele, 1989)

Our aim is not to show too many definitions but to emphasize the differences between them regarding the scope. It clearly can be seen that there are two types of these definitions regarding their scope: the narrow and the broad ones.

2.2 Different type of ‘technology management’ definitions

The same kind of dichotomy characterizes the definitions of technology management that we have seen at the definitions of technology.

The first few examples are broad scoped:

“Management of technology links engineering, science, and management disciplines to plan, develop, and implement technological capabilities to shape and accomplish the strategic and operational objectives of an organization.” (National Research Council, 1987)

“... technology management is about getting people and technologies working together to do what you want. Technology management is a collection of systematic methods for managing the process of applying knowledge to extend the range of human activity and produce defined products (goods or services).” (Kanz, Lam, 1996) Although “products (goods or services)” could suggest business, but non-profit and governmental organizations also provide goods and services, consequently these are referring for any kind of organizations, not just the business sector.

Let us see some narrow scoped definitions:

‘Technology management is the integrated practice, i.e. process, between business and the technical disciplines that are required to plan, develop, apply or install technological capabilities for products or services to form and achieve, successfully, the strategic and operational objectives in an enterprise.’ (Cory, 1988)

“The definition of TM includes planning, directing, control and coordination of the development and implementation of technological capabilities so that firms can shape and accomplish their strategic and operational objectives”. (Cetindamar, Phaal, Probert, 2016)

Technology management is the ‘process of effective integration and utilization of innovation, strategic, operational, and commercial mission of an enterprise for gaining competitive advantage’. (Badawy, 2009)

As at the definitions of ‘technology’, with the definitions of ‘technology management’ the two types of definitions can be clearly seen.

2.3 Different type of ‘innovation’ definitions

Let us cite some examples of how different authors defined innovation. The same duality appears.

According to Schumpeter (1934), innovation or development is a new combination of new or existing knowledge, resources, equipment, and other factors. He pointed out that innovation needs to be distinguished from invention. The reason why Schumpeter stressed this difference is that he saw innovation as a specific social activity or function carried out within the economic sphere and with a commercial purpose. In contrast, inventions can be carried out everywhere, without the intent of commercialization. Thus, for Schumpeter, innovations are novel combinations of knowledge, resources, etc. with the purpose of commercialization—it is essentially the process through which new ideas are generated and put into commercial practice. This “combinatory” activity he called “the entrepreneurial function”, and the social agents who are fulfilling this function are the “entrepreneurs” (Fagerberg, 2009).

Innovation could be:

- the implementation of products that are new to consumers;
- the implementation of production methods that are new to specific industries;
- opening of new markets;
- using new sources of raw materials;
- implementing new forms of competition that lead to structural changes in the specific industry (Schumpeter, 1934).

Drucker (1985, 17) defines innovation as the “specific tool of entrepreneurs, the means by which they exploit change as an opportunity for a different business or a different service. It is capable of being presented as a discipline, capable of being learned, capable of being practiced. Entrepreneurs need to search purposefully for the sources of innovation, the changes, and their symptoms that indicate opportunities for successful innovation, and they need to know and apply the principles of successful innovation.”

So innovation is not just about a new technology or inventions, but about new business opportunities created through new technologies, products, services, processes, business models, Etc. On the other hand, innovation does not happen by itself, but it is a structured, systematic process that requires discipline and has to be learned and practiced. To be a successful innovator, entrepreneurs have to search for the sources of innovation and exploit them. Innovation is a process for creating and introducing something new or advanced to create value. Innovation is a process that begins with a new idea and concludes with market introduction (Hisrich and Kearney, 2013).

“An innovation is the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations. The minimum requirement for an innovation is that the product, process, marketing method, or organizational method must be new (or significantly improved) to the firm. Innovation activities are all scientific, technological, organizational, financial and commercial steps which actually, or are intended to, lead to the implementation of innovations. Innovation activities also include R&D that is not directly related to the development of a specific innovation.” (Tiwari, 2008:1)

The definitions above are all referring to commercialization, market introduction, business utilization. So, innovation results from the application of knowledge and products in new business opportunities, regardless of whether these are the result of innovations in creating a new organization of industry or

technology through innovations in process, product, or service or innovations in business models and business processes.

According to the OECD, the main types of innovations were product, process, organizational and marketing innovation:

- product innovation: „introduction of a good or service that is new or significantly improved with respect to its characteristics or intended uses.”
- process innovation: „implementation of a new or significantly improved production or delivery method. This includes significant changes in techniques, equipment and/or software.”
- marketing innovation: „the implementation of a new marketing method involving significant changes in product design or packaging, product placement, product promotion or pricing.”
- organizational innovation: „implementation of a new organizational method in the firm’s business practices, workplace organization or external relations.” (Oslo, 2005:49)

In every item of the definition, the business part is the most important; they did not deal with the nonbusiness (governmental and nonprofit) sector, just the wording of the definitions could be explained that way that in some point these are relevant to the nonbusiness sector, but fundamentally the nonbusiness sector was not taken into consideration.

By 2018, it has been reduced only for two types of innovations: product innovation and business process innovation. (Oslo, 2018)

„A product innovation is a new or improved good or service that differs significantly from the firm’s previous goods or services and that has been introduced on the market.

A business process innovation is a new or improved business process for one or more business functions that differs significantly from the firm’s previous business processes and that has been brought into use by the firm.” (Oslo, 2018:21)

According to Rogers’s and Shoemaker’s (1971) thought an innovation is an idea, practice, or object perceived as new by an individual or other unit of adoption.

As it can be seen, the scope of these definitions mostly refers to the business sector. In this enumeration, only the definition of Rogers and Shoemaker (1971) considers not just the business sector, but all of the organizations as well. Most of the definitions do not consider the activities outside the business world, e.g., the activities of the nonprofit organizations.

3. THE PROPOSED TYPE OF THE DEFINITIONS

Since it is necessary not just in the forprofit but the nonprofit and governmental sector to use and manage technology, we have to use those kinds of definitions that do not limit the scope of their meanings only to the business sector. In our technology management MBA and MSc courses, we use the following definitions.

Technology is a system of expertise and instruments that enables us to fulfill our needs by exploiting nature’s potentials.

Expertise is the software side, and instruments are the hardware side of technology. They have to form a system, not only a set of elements. Technology is for fulfilling needs with such possibilities that are hidden in nature. If something is offered by nature ready for usage or consumption then technology is not needed for using or consuming it.

Technology management is a cross-functional activity that makes technology serve the effective and efficient operation of an organization.

Technology management is not just a functional but a cross-functional activity because technology is needed to every kind of jobs in any kind of organizations. Technology must serve the organization,

„the technological tail cannot be allowed to wag the corporate dog” (Twiss, Goodridge, 1989) - „corporate”, or any other kind of organizational „dog” in general, as we clarified it. Technology can and has to serve both effectiveness and efficiency. (Pataki, et al., 2020)

This suggestion of choosing the correct types of definitions also stands for the definition of innovation. We propose to use those definitions that are not narrowing down the scope only to the business sector but considering the other kinds of organizations.

4. QUANTITATIVE RESEARCH OF THE DEFINITIONS OF INNOVATION

We have rolled out quantitative research on the definitions of innovation in the Scopus Database. The search terms were “innovation, definition” in the Scopus database, in the subject area of Business, Management and Accounting, limited to articles and the keywords Innovation. The number of the articles in question was 329. Amongst these relevant were 195, used the concept of innovation in a broad sense 62, which is 31,8%, and used it in narrow sense 133, which is 68,2%.

The results are shown in Table 1.

Table 1: Quantitative research on the definition of innovation

Number of articles that use the notion of innovation	
in the broad sense.	in the narrow sense.
62	133
31,80%	68,20%

This examination should be rolled out into the Web of Science database as well.

5. CONCLUSION

Technology must be managed outside the business world. Not just the companies use technologies and innovate, but also the nonprofit and governmental sector. By defining technology, management of technology or innovation at the narrow way, when the definition only refers to the business sector, we can not attract the interests of nonprofits and local governmental organizations that they have to deal with technology, they have to study the accumulated knowledge on the field of technology management and innovation. That is why defining properly is essential not just in theory but also in practice. Therefore the broad types of definitions are recommended.

Abstract: The current period of life we are living has been defined by the covid 19 pandemic, certainly one of the worst pandemic that the world has faced in the last centuries. Albania is going through this situation for more than 14 months, the coronavirus has paralyzed the entire economy and there is still no hope for this situation to end definitely. The global recession is still in progress and all the governments are struggling to get ahead of the coronavirus. In Albania, the number of unemployed as a result of this crisis is about 70 thousand people and this figure could go over 100 thousand by the end of the year, raising even temporarily the number of people living in poverty. Significant improvements in 2018-2019 in this regard are already taking a heavy toll. In the short term, the economic impact of the pandemic is shifting the demand for labor to other sectors and regions, and it remains to be seen whether this will be only temporary, or lead to more permanent redistribution of labor in sectors. and certain regions. This study aims to analyze the covid 19 pandemic effects on the unemployment rate in Albania. Secondary data will be collected from INSTAT, World Bank and IMF, and statistic methods will be used to draw important conclusions.

Keywords: Coronavirus, Unemployment rate, poverty, average wage.

1. Introduction

Unemployment brings many difficulties to young people and individuals of all ages, it is an issue that affects people all over the world and has become today the most troubling problem for the governments of any country. Unemployment is a concept used for those working-age people who are not employed, are willing and able to work and are actively looking for it. The unemployment rate is a measure of the unemployment rate, which is calculated as a percentage, comparing the number of unemployed individuals to the labor force. The labor force consists of all unemployed and employed individuals. There are several types of unemployment, which are addressed in the world literature. Frictional unemployment, which is encountered as a result of the constant movement of employees from one job to another or between different regions. This kind of unemployment is inevitable. Structural unemployment is encountered when there is a long-term mismatch between labor supply and demand. It occurs mainly when the development of some branches of industry increases or decreases and the workforce is not flexible enough to adapt immediately to these changes. Cyclical unemployment is encountered when the demand for goods and services falls as a result of the economic downturn, which will lead to a decline in demand for labor. Seasonal unemployment is related to the seasonal character of production. This type of unemployment is a short term unemployment. "It is a recessionary situation when your neighbor loses his job, but turns into depression when you lose it." This saying of 1958 is current at all times. Unemployment has been and is today one of the biggest problems that is worrying our country and most developed countries. Being unemployed does not only mean not having a source of income from wages, but also suffering, among other things, its social and health costs. For a country, to have a high unemployment rate means to have high crime, informality and inequality among its citizens and for this reason the governments of different countries are working to reduce the unemployment rate through economic policies, opening up new jobs, etc. "Full employment does not mean zero unemployment, which means that not every man or woman in a country, free and able to work, does productive work every day of their lives. Full employment means that unemployment is reduced to short periods of unemployment, with the certainty that you will soon be employed in an old job, or in a new job that is within your capabilities". (Harry S Truman, 1958). Since the early 1990s, unemployment has pushed many Albanians to flee to other developed countries. Over the last 20 years, unemployment has fluctuated mainly with an upward trend, where the economic crisis in 2008 had a significant impact,

and a greater increase in unemployment is expected as a result of the COVID-19 pandemic that the world is facing today. This a main reason why we chose this topic for our study.

2. Literature Review

Numerous debates over economic policy, such as unemployment and economic growth, are often linked to wage increases that depend on social security contributions. The social system that exists in most countries is composed of two components: old-age pensions and unemployment insurance, while wages are determined by agreements between firms and unions. The link between unemployment and its social contributions has been extensively addressed by Nickell and Layard (1999). The link between pensions and the country's economic growth has been addressed by Saint-Paul (1992) and Belan (1998). Numerous studies have been conducted to determine the link between unemployment and economic growth. Most of them have been triggered by the work of Aghion and Howitt (1994); Pissarides (2000), who consider unemployment caused by the movement of individuals between jobs (frictional unemployment) and by economic growth. According to Aghion and Howitt (1994), economic growth is positively related to the unemployment rate, so an increase in economic growth would also lead to an increase in unemployment. Later papers, such as Brüninger (2000) and Lingens (2003), consider unemployment to be caused by wage 'bargaining' and economic growth. According to these models, unemployment hurts economic growth. Daveri and Tabellini (2000) argue that rising unemployment and declining economic growth are caused by rising labor income taxes. But since these taxes include social security contributions, there is an indirect link between unemployment pensions and growth. One of the few papers that clearly examines the link between social security, unemployment and growth is that of Corneo and Marquardt (2000). According to the conclusions reached by the model of Michael Brüninger (2004), social security affects unemployment and economic growth. Also, unemployment negatively affects growth, while economic growth has no direct effects on unemployment. This conclusion contradicts the conclusions of the work of Corneo and Marquardt (2000), according to which unemployment does not affect growth. According to the initial conclusions of the early works on the impact of emigration on unemployment, emigration did not affect the employability of locals. (e.g. Card Works, 1990; Altonji and Card, 1991; Pischke and Velling 1997). These findings have been criticized over time in the works of Friedberg and Hunt, 1995 or Borja, 2003. According to a recent study on the Greek economy, it has been concluded that: an increase in the number of emigrants on the one hand will lead to an increase in unemployment, but on the other hand the demand for goods and services of these emigrants will lead to openness of new jobs, equal to the number of unemployed immigrants. In most cases, the works study the effect of emigration to destination countries. The opposite is true of our country, it is the country of origin of immigrants. After the '90s, mainly in the '92s and '97s, Albania was a large source of emigrants to neighboring countries and beyond. One of the few papers studying the countries of origin of migration is the one developed in 2008 by Fida Karam and Bernard Decaluwe. The paper tested the hypotheses with data from the state of Morocco. The paper deals with migration between rural-urban areas and international migration. As a conclusion of the developed model: international emigration lowers the unemployment rate and increases the level of wages, while internal migration increases the unemployment rate and decreases the level of wages. If both of these migration flows coexist in one country, then the final effect on unemployment and wage levels is unclear. Unemployment links with other elements have also been studied. There is an inverse relationship between unemployment and wages in different economies. This relationship has been termed the 'wage curve' and has been confirmed as an empirical law of economics by Blanchflower and Oswald (1994). Their data show that wages are negatively linked to unemployment. Unemployment is seen as a balancing variable in the labor market, which is characterized by wage segmentation and inflexibility. High urban wages cause high urban unemployment. So unemployment is a function of wages and not unemployment wages. In the literature two main forms of explaining the negative relationship expressed by the wage curve have been suggested. First we have the wage boost hypothesis, which means that profit-maximizing firms choose to set wages above their equilibrium level in order to influence the behavior of their employees. This hypothesis is presented in Shapiro-Stiglitz (1984)'s market efficiency model, which focuses on imperfect monitoring and the need to prevent avoidance. Firms increase wages so that the cost of job loss for employees is high. If local unemployment is high, the difficulty of finding a job is also high, which is why employees are afraid of being fired. So we see that high unemployment leads to wage increases. The second

hypothesis is based on the model of trade union agreements. High unemployment frightens employees and also lowers their bargaining power. So the attention of the unions is not focused on wages but on the difficulty of finding work. The unemployment-GDP link is one of the oldest studied. Historically, the law has been implemented that a 1% decrease in GDP is accompanied by a 2% increase in unemployment (Okun's law). But, based on the data related to these two indicators, it seems that this law was not implemented during the recession. During the recent recession, the decline in GDP, you responded to a larger increase in unemployment than the definition of Okun law. The unemployment-poverty link has been studied for many years. Blank and Blinder (1986) were among the first to study the relationship between unemployment, inflation, and poverty rates for households and individuals. After the regression, they concluded that inflation and unemployment rates were positively related to the percentage of people living in poverty during the period 1959-1983. However, while inflation was accompanied by an increase in the poverty rate, this effect was only one-seventh of the increase caused by poverty in unemployment rates. This led Blank and Blinder to conclude that while unemployment and inflation together would increase poverty, empirical evidence supports their belief that "Unemployment, not inflation, is the most cruel." However, in some other studies no clear link has been found between poverty and unemployment (Gustafsson & Johansson, 1999; Mehrara & Mohammadian, 2015). "The positive component of unemployment (UMP +) indicates a positive impact on poverty in the economy. This indicates the presence of non-inclusive growth (a non-uniform growth) because optimal output is negatively affected by unemployment. Since growth is no longer inclusive, poverty will increase. The negative unemployment component (UMP-) also has a negative and significant link to poverty. Therefore, policies that will encourage job development will act as an antidote to poverty reduction. "Such policies include holidays for producers, the promotion and provision of sustainable electricity supply, and the granting of industrial loans to industrialists in the economy."

3. Methodology

For the interpretation of the data of this work we have used secondary data, and we have relied on the literature review conducted above. Data on the main indicators that we used such as: unemployment rate, poverty rate, remittances, base salary and real GDP change (GDP growth), are found on the official website of the Central Bank of Albania, INSTAT and the World Bank. The data used belong to the period 2000-2020. We used the multifactorial econometric model through the Gretl econometric program to detect the existence of a link between the independent variables (base wage, poverty rate and GDP growth) and the unemployment dependent variable. The form of the function is of the type:

Formula 1. Multilinear Regression.

$$\text{Unemployment} = \beta_0 + \beta_1 * \text{Poverty} + \beta_2 * \text{Average Wage} + \beta_3 * \text{GDP} + \beta_4 * \text{remittances} + \varepsilon$$
 Hypothesis:

HO: There is no statistically significant factor that determines unemployment rate in Albania.

H1: At least one of the factors subject to this study, is statistically significant to determine unemployment rate in Albania.

Based on this main hypothesis we have raised four secondary hypotheses. The first hypothesis is about poverty, the second hypothesis is about the average wage, the third is about the importance of GDP and the fourth about remittances. After performing tests on the significance of the model it turns out that the model is significant. But we note that after performing the test in Gretl one of the independent variables (average salary) does not come out significant (significant). For this result we think this relates to the data, where there is no lack of the fact that the data may not be completely accurate as in the case of poverty where some data were not published, but also the data of other variables obtained from sources official Albanian there is a possibility of political influence, where not all unemployed or employed may be declared influencing the unemployment rate; as well as not all remittances as incoming and outgoing are all declared. It should not be forgotten that there are still employees who receive a salary which is below the minimum, although they can be declared as employees with a minimum wage, which is delivered in cash, affecting the average salary. All these we think have a significant impact on the validity of the data of the variables taken in the study, which is also reflected by the testing itself in the econometric model. At the end of the testing of the

econometric model in Gretl, the first hypothesis H_0 is rejected and the first alternative hypothesis H_1 is confirmed: At least one of the economic factors taken into study is statistically significant and affects unemployment in Albania.

4. Covid 19 effects on Albanian Economy

As mentioned above, the impact of the COVID-19 pandemic and quarantine for about three months have negatively affected the world economy and Albania. This post-pandemic situation has affected the loss of millions of jobs and damaged businesses, especially in the poorest countries. The American rating agency Standard & Poors has published a report that ranks Albania in the top 15 countries on the list of countries whose economy will be damaged by the new coronavirus COVID-19, where tourism will have the greatest impact. In Albania, the number of unemployed as a result of this crisis so far is about 70 thousand people and this figure could go over 100 thousand unemployed by the end of the year, affecting the increase, even temporarily, of the number of people living in poverty. Significant improvements in this regard are already taking a heavy toll. In the short term, the economic impact of the pandemic is shifting the demand for labor to other sectors and regions, and it remains to be seen whether this will be only temporary, or lead to more permanent redistribution of labor in sectors. Therefore, Public and Private Employment Services (PES) in the country are not only facing an increase in the number of jobseekers, but also the need to potentially relocate many of them to professions, sectors and regions. others. There has even been a marked decline in the number of vacancies in the National Employment Service. According to a recent World Bank report, which assesses how COVID-19 can affect poverty and well-being of families in the Western Balkans, the most vulnerable are the self-employed, those with informal employment and those with temporary or non-temporary employment. very safe. As a result, the poverty rate is expected to rise from the current 40% to 48% (the number of people living on less than \$ 5.5 a day, according to purchasing power). Poverty will also be aggravated due to remittances, as Albanian emigrants will start sending less money to families, as their work in European countries will be affected. They are, at best, forced to work from home; business owners have been forced to close their businesses temporarily; others have been forced to take compulsory paid leave; while in the worst case, some have even lost their jobs. Consequently, the ability of these persons to send money home to their families is significantly reduced, and undoubtedly the worst will suffer those families whose only source of income is the remittances they receive from their family members. from outside. According to the changes in the government decision, all individuals, former employees in entities that have been allowed to carry out activities or have been closed according to the orders of the Minister of Health and Social Protection, who have been fired, are beneficiaries of assistance of 40 thousand ALL. from March 1, 2020, to May 17, 2020. The application for the beneficiary employees, made online, by the employers, until June 5, 2020, exempts them from the penalty for non-application. The anti-Covid-19 financial package includes: Two Financial Packages as social support for citizens and businesses; additional budget for the health sector; additional budget for the defense sector for their humanitarian work; additional to the Reserve Fund for other necessary and unforeseen expenses. The first package includes support for small business and citizens, while the second package is support for entrepreneurship and employees. The number of beneficiaries is expected to reach over 178 thousand.

5. Conclusion

At the end of this topic we conclude that unemployment has been, is and will always be a delicate and very important issue in the design and implementation of various policies for the development and economic sustainability of a country. As in Europe, the issue of unemployment must be looked at with great care, especially in the case of women and young people. In addition to the economic factors studied that affect the unemployment rate (poverty, remittances, GDP growth and average wages), a very large impact on these factors will have the impact of the COVID-19 pandemic, and consequently will have an impact on unemployment as well. After conducting factor testing in the Gretl program for the period 2000-2020 we came to the following conclusions:

Determinability coefficient; $R^2 = 77\%$, ie 77% of the variability of the unemployment rate, is explained by the factors taken into account, namely the basic wage, the poverty rate, the real change in GDP and remittances. If GDP grows by 1% and other variables remain constant, then the unemployment rate will rise by 0.27%. GDP growth is in the same direction as the unemployment rate and is a significant factor. If the poverty rate increases by 1% and other variables remain constant, then the unemployment rate will increase by 1.26%. Poverty is also in the same direction as the unemployment rate. The same result with the regression conducted by Blank and Blinder (1986), who concluded that unemployment rates were positively correlated with the percentage of people living in poverty. The link between unemployment and poverty is important. If remittances increase by 1% and other variables remain constant, then the unemployment rate will decrease by 0.009%. So the variables move in the opposite direction. If the average wage increases by 1% and other variables remain constant, then the unemployment rate will decrease by 1.57%. The COVID-19 pandemic is expected to affect these factors even more, further aggravating the unemployment rate, where I think the impact will be even greater on the economy than it was after the 2008 crisis if the government does not take appropriate measures to reduce unemployment rate starting with: job creation, creating a favorable and reliable business climate, accurate and reliable measurement of poverty indicators (for which there is no data publication since 2012), the functioning of trade unions for the protection and rights of employees, the increase of vocational education, the creation of a favorable environment for foreign investment, the development of vocational training centers, more frequent checks on companies and the declaration of salaries and the manner in which salaries are paid. to PES which must be prepared to adapt to change, with a new labor market as a result of the impact of the pandemic, where digitalization and innovative development are rapidly dizzying life will replace jobs and work processes that require a new qualification, otherwise, towards the future of this market.

The Missing Role of Civil Society in the Democratization Process of Albania

Dr. Gerti Sqapi¹

¹Applied Social Sciences, European University of Tirana, Tirana, Albania. gerti.sqapi@uet.edu.al

Abstract: One of the most debated issues in the democratization literature in recent decades has been that about the role of civil society and the impact it has on the so-called "third wave" democracies. Certainly, the debate over the role of civil society as an important factor in explaining the success of a democracy is relatively old in the literature and dates to the time when Alexis De Tocqueville and followers of the Tocqueville school of thought praised the virtues and effects of associative life over the individual and society as a whole. Yet this debate would be revived again by scholars and students of third-wave democratization, who argued for relative weaknesses and structural and organizational deficiencies of civil societies in post-communist countries and seeing these as important conditional factors for the explanation of the unsuccessful outcome of democratization in these countries. In this paper, the variable of a vibrant and dense civil society is analyzed here in terms of three key dimensions: that of *membership in civil society organizations*; *participation in civil society activities*; and the *social capital levels* that characterize it. Based on these dimensions, here, it is argued about the existence or not of a strong and dynamic civil society in the case of Albania, which will constitute the case study of this paper. It is argued that the relative weakness of civil society in Albania in aftermath of the collapse of the communist system is one of the main factors that has influenced the non-institutionalization of an effective and consolidated democracy in this country.

Key Words: Civil Society, Democratization Process, Membership in Civil Society Organizations, Participation, Social Capital.

I. Introduction and Definition of What Civil Society Is

In the growing literature on democratization in recent decades, one of the most intriguing issues for scholars has been the role of civil society and its impact on the new so-called "third wave" democracies. The debate over the role of civil society is relatively old in this literature and can be dated back to the time when Alexis De Tocqueville wrote his considerations in *Democracy in America* (1835-1840), praising the virtues of the associational life of Americans in civil life and seeing it as a promoter of models of cooperation between citizens in a democratic polity. Since then, the concept of "civil society" has been treated from different perspectives, with scholarships that have placed distinct causal emphasis, as well as re-dimensioning the term in different ways. However, the concept of "civil society" and subsequent studies on it would be revived again after the 1990s, with the rapid wave of revolutionary changes in the aftermath of the collapse of communist dictatorships in the eastern bloc of Europe. For Gideon Baker, the rediscovery of the concept of civil society arises from the fact that the opposition movements in Eastern Europe used "the idea of civil society in theorizing their struggle to create a protected societal sphere separate from the official sphere of the all-embracing party-state" (Baker, 1998: p. 82). In the wake of the dramatic changes that followed the collapse of communist dictatorships in Eastern and Southeastern Europe, we have a sparking debate among various authors of democratization on the extent to which civil society organizations played a role in resisting authoritarian dictatorships, in the impetus for the beginning of democratic transitions in post-communist countries, and more importantly, what role did organized life play in achieving effective and well-functioning democracy in a given country.

In this paper, we will focus precisely on explaining the role that organized associative life plays in society and the impact it has on achieving successful democratization in a certain country. In order to do this, the (independent) variable of civil society in this study will be analyzed in terms of its three main dimensions: that of *membership in civil society organizations*; *participation in civil society activities*; and levels of *social capital* that characterize it. Then, in Part III of this paper, the case study of Albania is examined in relation to the conditions of civil society and the impact it has had on the democratization process of this country after the 1990s.

Firstly, we need to give a definition of the concept of civil society in this paper on which to start our analysis. Here we are based on a definition given by Larry Diamond, according to which civil society is understood as:

“Civil society is the *realm of organized social life that is open, voluntary, self-generating, at least partially self-supporting, autonomous from the state, and bound by a legal order or a set of shared rules*. It is distinct from “society” in general in that it involves citizens *acting collectively in a public sphere* to express their interests, passions, preferences, and ideas, to exchange information, to achieve collective goals, to make demands on the state, to improve the structure and functioning of the state, and to hold state officials accountable” (Diamond, 1997: 6).

Thus, civil society refers to that arena of politics where various associations or movements created by citizens, autonomously from the state, try to articulate interests, causes, preferences, ideas, and values in order to achieve common goals. In this sense, civil society can include multiple groups and organizations from all areas of social life (economic, religious, environmental, cultural, sports), but also associations from all different strata of society (such as trade unions, business, entrepreneurs, professionals, students’ associations, etc.). These various civil society organizations, which include the entire intermediary space between the state and the individual or family, are created voluntarily by members of society and in order to pursue or protect their interests or values.

II. The Role of Civil Society and Its Conditional Effect on Democracy

The role of civil society as a crucial factor to explain the success of a well-functioning democracy has been emphasized by various authors who have praised the virtues and effects of associative life on the individual and society as a whole. Thus, for example, Robert Putnam, a well-known author who has defended the role or vitality of the associative life of the citizens of a country on the stability and quality of democracy, has argued that:

“Civil associations contribute to the effectiveness and stability of democratic government... both because of their “internal” effects on individual members and because of their “external” effects on the wider polity. Internally, the associations instill in their members habits of cooperation, solidarity and public-spiritedness... Externally... a dense network of secondary associations [which strengthens the articulation and aggregation of different interests] both embodies and contributes to effective social cooperation. Thus, ... in a civic community, associations of like-minded equals contribute to effective democratic governance” (Putnam, 1993: p. 89-90).

Membership in the associative life of society creates favorable conditions for democracy as it provides a space for citizens to cultivate internal links with the various organizations of which they belong, which helps to develop and internalize democratic values and norms (... habits of cooperation, solidarity, tolerance, political participation, public-spiritedness). Likewise, membership, along with active participation in various civil society organizations, produces models of behavior that enable citizens to overcome individual isolation and cooperate among them in achieving common collective goals. In this sense, membership in various civil society organizations has “internal” effects on individual members as Putnam notes, as it produces (or enables) models of active social interaction among citizens that are necessary for democracy. Thus, Putnam states in one of his famous essays that various associations and “their dense networks of interaction broaden the participants’ sense of self, developing the “I” into the “we” (Putnam, 1995: p. 67). Membership in all types of civil society organizations operating in the intermediary space between the state and the individual, regardless of their relative importance or the different areas in which they operate, is important according to Putnam, as they have the potential to develop democratic values and norms and instill patterns / habits of cooperation between their members, which are necessary for a successful democracy. In this sense, the argument here is that the more extensive and denser the network of social interaction that is created between the citizens of a country that are part of civil society organizations (regardless of their type), the more opportunities they have to overcome their individual isolation and opportunism in pursuit of a common good, and the more likely democracy is to succeed in that environment. As Larry Diamond has noted, “civil society serves democracy best when it is dense in the sheer number of associations. The greater the density of associational life, the more memberships the average citizen is likely to have, and the wider the range of societal interests and activities that will find organizational expression” (Diamond, 1997: p. 24).

Here we come to the other positive, "external" effects, as Putnam points out, that membership in various civil society organizations has on politics and society at large. Firstly, because civil society organizations also serve as effective channels for the articulation and aggregation of different interests in society, which facilitates (... contributes to effective) social cooperation between different citizens and expands their opportunities for political participation. As Cohen and Arato have suggested on this point, civil society performs two important democratic functions. "First, associations and movements from within civil society cooperate, develop identities, offer the opportunity for participation and create networks of solidarity. Secondly, civil society organizations and associations try to influence or reform the state" (Cited in Grugel, 2002: p. 95). Thus, according to these authors, membership in various civil society organizations and associations helps towards the well-functioning of democracy in a country as it allows citizens to promote different interests, to develop common identities, to share their experiences, and ultimately, to be active in public life by expanding participation opportunities. As for the second function that Cohen and Arato emphasize regarding the role of civil society organizations and associations, this is probably the most important function they play in developing (beginning of the democratic transition) and strengthening democracy in a given country. Jean Grugel has stated in this regard that: "the most important democratic function that civil society can perform is its engagement with the state as a force for change. The capacity of civil society organizations to press for reform and to engage with the state is perhaps a key for understanding whether democratic consolidation takes place" (Grugel, 2002, p. 95-96).

To better understand this function that civil society plays in the advancement and strengthening of democracy, we must also move on to what we have described as the second dimension of the (independent) variable of civil society that we build here: that of *participation in civil society activities*. This is an essential component of civil society that shows both its robustness and vitality as conditional in promoting democratic processes and strengthening democracy in a given country. Here, the main role played by a vibrant civil society in order to embed democracy in a given environment is that it serves as a counterbalance to the (power of) the state, thus performing vital opposition functions and protecting the various interests of the society. As Gordon White has argued, "a growing civil society can alter the balance of power between state and society in favour of the latter, thereby contributing to the kind of 'balanced opposition' held to be characteristic of established democratic regimes" (White, 1994: p. 382). Widespread mobilization and participation in organized activities or social movements increase the ability of citizens to both control and limit the exercise of state power by incumbents. This function of civil society can be said to be conditional on democratization processes both in the context of authoritarian states, where participation and mobilization in organized social movements (of civil society) is the main impetus for the launch of liberalization and democratic change, as well as in countries that have started the transition, and that seeks to strengthen democracy.

In this line of thought is also Laurence Whitehead, when he notes that one of the main conditional factors of democratization is the establishment of broad associative networks among citizens which are capable of limiting the discrete power of the authoritarian state. Whitehead argues that: "where such 'civil society' customs and practices proved capable of resisting anti-democratic governments, it might only be a matter of time before liberalization and subsequent democratization took their (almost inevitable) course" (Whitehead, 2002: p. 66). In this sense, the main impetus for starting democratization in a country is always generated "from below", and it can be successful if it manages to create consensus for mobilization of citizens in social movements (protests, demonstrations, strikes, etc.), and whether the mobilizing connective structures between them are strong and dense.

Likewise, the role of participation in civil society activities and movements is also important for the deepening and strengthening of established democracy in a given country. As Jean Grugel best expresses this, "social struggles facilitate democratic consolidation because they can lead to the reform of the state, the extension of citizenship and the entrenchment of rights" (Grugel, 2002: p. 95). Here, the main contribution that an organized and attentive civil society has to the consolidation of democracy in a given environment, is the controlling and restrictive role it plays on the exercise of state power, thus ensuring accountability and the responsibility of incumbents. In this way, it makes it possible not only to ensure the vertical dimension of the accountability of politicians in front of the electorate (represented mainly by the attributes of elections), but also the horizontal dimension of

accountability in a democratic system (which has to do with the dimension of liberal constitutionalism and the rule of law) by limiting and legitimizing the power of the state within the framework of the rule of law. As Larry Diamond points out, “civil society not only restricts state power but legitimates state authority when that authority is based on the rule of law” (Diamond, 1997: p. 6). An organized civil society and a public engaged in social activities and movements can contribute to the consolidation of democracy in a given country by serving as an essential counterbalance to state power, and by performing vital opposition functions (even in the face of weak and fragmented party systems, or in the context of a weak political society). Such a role of contentious politics in favor of the consolidation of democracy, civil society has probably played best in the case of the democratization of Poland. Thus, authors like Gregorz Ekiert and Jan Kubik have argued that the consolidation of democracy in Poland has been mostly a product of an active and committed civil society, even when Poland faced an under-institutionalized party system, that is, a weak political society (Ekiert & Kubik, 1998). According to these authors, the main factor that contributed to the consolidation of democracy in the case of Poland has been the role of an active civil society (through participation in protests, demonstrations, strikes, etc.), which conditioned the dynamics of elections and the decisions of political elites to adhere to the rules of the democratic game.

Another function that active participation by citizens in social activities and movements can play about politicians' accountability and the well-functioning of the democratic system, is through the constant pressure that it can generate. The argument here is that “a strong civil society can play a disciplinary role in relation to the state by enforcing standards of public morality and performance and improving the accountability of both politicians and administrators” (White, 1994: p. 383). The vividness and strength of an active civil society can limit the potential for abuse by incumbents, or their ability to make decisions that go against the public good, keeping politicians accountable (not only during the period of electoral campaigns), by thus serving the health of the democratic system. Thus, a participatory and active civil society positively influences the institutional performance of democracy in a given country.

However, for civil society to perform such functions for the benefit of deepening and consolidating democracy, it must be characterized by another significant dimension that shows its strength and vitality: the accumulation of *social capital* within it. As Gordon White has pointed out, “civil society derives much of its specific political character from the deeper socio-economic structure and the distribution of interests, social norms and power resources which society [where it operates] embodies...as a separate and distinct sphere of social relations, civil society itself embodies a specific source of social power based on a (differential) capacity for association which is a key path to social empowerment (White, 1994: p. 381). Thus, the source of strength or weakness of civil society in a given environment must be seen in the social structure of society where it operates, by the various interests acting in society, the norms and features of the organization or the way it functions, etc. In this sense, civil society embodies a specific source of social power, derived from the socio-economic structure of the society in which it operates, and conditions the opportunities for associations and participation of citizens in organized social life. Perhaps the author who has best explained this connection is Robert Putnam through the concept of social capital. Putnam explains this relationship between strong networks of citizen participation and positive institutional performance (a well-functioning democracy) in terms of “*social capital*” - by which he means the networks, norms of reciprocity and trust that are fostered among the members of community associations by virtue of their experience of social interaction and cooperation. Putnam argues that social capital has a positive impact on governance because it allows community members to overcome the dilemmas of collective action which would otherwise hamper their attempts to cooperate for the purpose of bettering social life (Cited in Boix & Posner, 1996: p. 2; Putnam, 1993: p. 167).

Thus, for Putnam, social capital is an essential dimension of social organization and the strength of civil society, as it enables participants to act together more effectively to pursue common interests among themselves. From this point of view, social capital facilitates the undertaking of coordinated actions in the organizational life of the members of a community by promoting cooperation between them and making more efficient efforts in achieving common goals. Voluntary cooperation is greatly facilitated by interpersonal trust and norms of reciprocity, and these cultural orientations in return are fostered (but also deepened) by “networks of civic engagement”, in which citizens are drawn together as equals in “large horizontal interactions” (Putnam, 1993: p. 167 and 173). It should be

emphasized that the importance of taking joint action for the well-functioning of the democratic system should be seen precisely in the social capital and in the networks of civic engagement (equally structured and horizontal relations) between the citizens that it manages to generate. In this sense, civil society in a given country would be considered weak, structurally deficient, and with very little or no impact on conditioning the well-functioning of democracy, if it is not characterized by relatively high levels of its social capital.

Thus, only civil societies characterized by high levels of social capital and networks of civic engagement can create favorable conditions for democracy. In other words, these features of social capital make civil society in a certain country structurally stronger and enable it to perform better the functions of influence, control, and accountability to the exercise of power.

III. Civil Society in Albania: A Missing Role in the Democratization Process

Based on the theoretical framework elaborated above here to explain the conditional relationship between civil society and democratization, in this section, we analyze specifically the case study of Albania in its post-communist period in the '1990s. Here it is argued that the lack of a robust and dynamic civil society in Albania is one of the main factors that has conditioned the product of unsuccessful democratization during its post-communist period.

Albania is one of those countries where civil society faces structural weaknesses and remains underdeveloped and powerless to positively influence the democratization processes after the beginning of the transition in 1991. The development of such a civil society in Albania has been considerably influenced by the different model/trajectory of its historical, political and cultural development, which have made the traditions of joint social organization and civic engagement in this country remains vague. The low levels of membership and participation in civil society organizations have also brought about a relative weakness/lack of genuine pressure generated from below to advance the democratization process in post-1991 Albania, as well as conditioned the quality of the flawed democracy that still exists in this country. Barriers to the development of a civil society inherited from its previous totalitarian system, as well as the inadequate structural conditions to promote the social organization and civic engagement of citizens in post-communist Albania, make it easier for the political elites in this country to deviate from democratic reform and the democratization process, to have low levels of accountability, and to guarantee that they would have fewer restrictions on their authoritarian control.

To understand the conditions for the development of a relatively weak and powerless civil society to condition the processes of democratization in post-communist Albania, several factors must be emphasized. First, and perhaps most importantly, is the inheritance of an oppressive and pervasive totalitarian communist regime in almost every aspect of social life (even in the private sphere) in Albania. The impact of the inheritances of the previous totalitarian regime on the sphere of associative life, in the case of Albania, has probably been stronger than anywhere else in the Eastern Europe countries, for the very fact of the harshness and brutality of the regime of Enver Hoxha that ruled the country for a long period. Over 46 years of the oppressive and totalitarian dictatorship in communist Albania, combined with a totally collectivized economy and the suppression of any form of pluralism or social activism outside the control of the party-state, practically, as Linz and Stepan have noted, had shaped the lives of subject-citizens (Linz & Stepan, 1996: p. 377). In the case of communist Albania, the regime managed to penetrate and control every aspect of social life, even private, and to shape the beliefs of citizens through various forms of propaganda, education, organization of mandatory joint activities, surveillance, fear, terror, etc. The result here was the blurring of the effective distinction in the boundaries between the state (regime) and society, and the almost disappearance of the latter's space to be organized or mobilized autonomously and independently from the state (Grzymala-Busse & Jones, 2002: p. 534 and 539). Any form of social pluralism was forbidden, and the mobilization of society into mass organizations (party-state transmission belts) was done in a mandatory way and through the persuasion of subject-citizens. In Albania, the totalitarian regime with its inheritance of oppression and subversion of any form of social pluralism and the extermination of early (autonomously) forms of social organization made it more difficult for post-transitional societies to form and support social organizations (of civil society). The

inheritances of a relatively long communist rule left behind significant negative consequences on the sphere of associational life in Albania during its post-communist period.

Also, another factor that has affected the relative weakness of the Albanian civil society, has been a lack of previous social and civic traditions of organization in the society's associational life, which has been conditioned by different historical and cultural trajectories of its development. Albania experienced only a very short period of social and political liberalism in the early 1920s (when the modern Albanian state was established and functioned normally with its institutions), but it can be said that it did not leave any significant trace in the collective memory of the Albanian society in the years/decades that followed. In the absence of such social and autonomous traditions of organized associational life in Albanian society, the communist dictatorial regime that was subsequently installed in this country during 1944-1945 found it relatively easier to penetrate and take root without encountering any significant resistance from any mobilized opposition, and so managed to effectively blur the line that existed between the regime and the society. In countries like Albania, there was little or not at all civic tradition of organized associational life to recover, so its civil society remained weak and powerless to condition the process of democratization and the quality of democracy after the beginning of its transition in the 1990s.

These important historical and social inheritances from the previous period of the totalitarian communist regime, but also the lack of previous traditions of the social and civic organization, had their consequences in the underdevelopment of civil society and associative life in the period of democratic transition in Albania. Thus, some consequences of this social inheritance in Albania were: the culture of distrust in the new organizations/associations that were created and in their goals; the refusal to participate in them (related to the legacy of distrust and mandatory participation in the previous communist organizations); cooptation, apathy, “and societal atomization, revealing the scarcity of social capital and “the lack of a culture of a free collective activity” (Cited in Diamond, 1997: p. 6; Smolar, 1996: p. 33). Also, another consequence of this social and cultural inheritance in Albania is the continuity of friendship networks in society. In the postcommunist society of Albania, “unlike in many Western societies - where voluntary organizations have become a central part of the social and political culture, and where people join organizations in order to meet new people and to expand their horizons through public activities - many people are still invested in their own private circles, and they simply feel no need, much less desire, to join and participate in civil society organizations” (Howard, 2000: p. 163).

Thus, if we refer to what we have defined as the first dimension of a vibrant and dynamic civil society - membership in civil society organizations - we see that it marks relatively low levels of participation of Albanian citizens in the period after the beginning of democratic change. The general weakness and lack of vividness of civil society organizations in Albania are manifested by the following data indicators obtained from World Values Surveys. If compared to the same indicators in the cases of Spain or Poland in the period after they overthrew their authoritarian regimes, membership percentages in organizations/associations of civil society in Albania mark levels almost 3-4 times lower (World Values Survey, Wave 3, 1995-1998).

Table 1: Indicators of Membership in Civil Society Organizations in Albania¹

¹ Data indicators for the dimension of membership in civil society organizations in Albania are derived from the aggregation of % of membership in these organizations: Church or religious organization (v28); Art, music or

Albanian citizens express their general apathy and distrust towards civil society organizations also regarding their participation in social activities and movements of civil society. Thus, although in the initial stages of transition (1991-1992), in Albania there were relatively high levels of popular mobilization against the elites of the old regime and in favor of reform and democratic change, over time participation in civil society activities (such as protests, demonstrations, strikes, etc.) by Albanian citizens began to fade and "lower levels of activity in post-transitional civil society" were noted (Bernhard & Karakoc, 2007: p. 562). The relationship of Albanian citizens towards their state continued to remain relatively passive, and a transformation of the role of civil society organizations and associational life in general in conditioning positively the democratization process in this country did not occur. The lack or the relative weakness of genuine pressure generated from below by organizations and collective actions of civil society has been a feature of Albanian society and is one of the main factors that have hindered the advancement of the process of deepening democracy in Albania, thus making it easier for the political elites in this country to have lower levels of accountability and fewer restrictions towards a more authoritarian control. Civil society in Albania can be said to have been unable to effectively balance the tension in the (accountable) state-society relationship during the period of the democratic transition, thus conditioning the quality of democracy with defects and problems that appeared in Albania for almost three decades now.

Another characteristic feature of the Albanian civil society in the period after the beginning democratic transition is the relatively low levels of social capital that characterizes it. Relatively high and widespread levels of distrust, apathy, and vague associational and civic life in Albania are a consequence of a weak social capital of its civil society, which as we have noted above in this paper, derives much of its specific political character from the deeper socio-economic structure and the distribution of interests, social norms and power resources (White, 1994, p. 381) of society in which it operates. In this way, the social and historical inheritance, low levels of economic development and well-being, the dominance of survival/materialistic values among the masses of its citizens, have caused the civil society in Albania to have weak levels of social capital and to be characterized by a low sense of vividness and protection of the public interest. As Ekiert and Foa have pointed out, "values and preferences may determine whether civil society develops along normative or clientelistic lines, that is, whether civil society organizations exist to defend citizen rights, work for public good and advance the rule of law and democratic process, or simply as a means of extracting material rents for their leaders and members from the state and local administration" (Ekiert & Foa, 2011: p. 31). Thus, if we refer to the measurement of this dimension of civil society in the case of Albania, we see

educational (v30); Labor union (v31); Environmental Organization (v33), Professional Association (v34); Charitable Association (v35); and Any other voluntary organization (v36). Data taken from World Values Survey Wave 3 (1995-1999). Available at <https://www.worldvaluessurvey.org/WVSDocumentationWV3.jsp>

that the indicator of social capital in this country is much lower (at the level of 0.386²) in relation to the indicators of social capital of civil societies in other countries of Central Europe (measured in the same report), which had more successful cases of democratization compared to Albania. The low levels of social capital in Albania have affected the non-engagement of Albanian citizens in the public sphere, as well as the lack of development of civil society in this country on a normative basis and in the function of the public good.

IV. Conclusions

Civil society during the transition period in Albania has been weak and powerless to play its conditional role in the deepening and well-functioning of democracy in this country. In this paper, it was argued that the lack of a robust and dynamic civil society in Albania is one of the main factors that has conditioned the product of unsuccessful democratization in its post-communist period. The development of such a weak civil society in Albania has been considerably influenced by the model/trajectory of its historical, political and cultural development, which have made the traditions of joint social organization and civic engagement in this country remain vague. These significant social inheritances from the previous period of the totalitarian communist regime, but also the lack of previous traditions of social and civic organization, had their consequences in the weak development of civil society and associational life in the period of democratic transition in Albania.

Thus, some consequences of this social inheritance in Albania were: the culture of distrust in the new organizations that were created and in their goals; the refusal to participate in them (related to the legacy of distrust and mandatory participation in the previous communist organizations); the cooptation of members of civil society organizations; apathy; social atomization which also highlights the void of social capital in Albanian civil society. The low levels of membership and participation in civil society organizations have also brought about a relative weakness / lack of genuine pressure generated from below to advance and deepen the democratization process in post-1991 Albania. Barriers to the development of a civil society inherited from the former communist system, as well as inadequate structural conditions to promote the social organization and civic engagement of citizens in post-communist Albania, make it easier for the political elites in this country to deviate the democratic reform and deepening democratization, to have low levels of accountability, and guarantee that they will have fewer restrictions on their authoritarian control. In countries like Albania, there was little or no civic tradition of social organization to recover, so its civil society remained weak and powerless in conditioning the process of democratic consolidation and the quality of democracy in this country.

Abstract: The multi-stakeholder model, its basis being an extended partnership between different structural entities, is applied in particular socio-economic contexts. It benefits from the complementarity of the competencies and strengths of the partner organizations, but also takes over the difficulties and redundancies specific to joint actions. The paper illustrates the application of this model in rural development in Romania, as a process supported by financing programs of the European Union, especially by financing and developing the organisational role of Local Action Groups. From a methodological point of view, the approach is an integrated one, based on extended documentation at a strategic and operational level, and also on the analysis of the actors who are involved in the Local Action Groups perceptions and their beneficiaries' perspectives, through the investigation with the help of privileged interviews. The analysis highlights several characteristics: reduced managerial capacity, poor communication, statutory ambiguity. The results illustrate the benefits of this multi-stakeholder approach, but also certain dysfunctional aspects of these partnerships. The conclusions aim at the potential role of Local Action Groups in animating communities, but also possible recommendations for overcoming the identified negative aspects: lack of strategic orientation, inadequate documentation of administrative capacity, insufficient allocated resources and reduced autonomy due to the early stage of development.

Keywords: multi-stakeholder model, local action groups, financing programs, regional sustainable development.

1. INTRODUCTION

In the analysis of regional development, several aspects are considered of increased interest: spatial imbalances – especially urban-rural, growth poles and vectors, social innovation and multi-stakeholder models. Social aspects are unveiled as a core ingredient of innovation, aiming to identify the concrete way in which society manages to be involved in finding specific and appropriate solutions for community development.

The multi-stakeholder model is based on an extensive partnership between structurally different entities that is applied in particular socio-economic contexts. On the one hand, it benefits from the complementarity of the competences and strengths of partner organisations, but it also takes on the difficulties and redundancies specific to joint actions.

The objective of the paper is to illustrate how the multi-stakeholder model is applied in the Romanian countryside, through the Local Action Groups (LAG), supported by the initiatives of the European Union. The research methodology aimed at an integrated approach.

The first step was an extensive documentation, at strategic and operational level. We studied the evaluation reports present on the websites of the Ministry of Agriculture and Rural Development (<https://www.madr.ro>) and the National Network of Rural Development (<https://www.rndr.ro/leader.html>). We carried out a descriptive analysis of the LAGs, presenting their evolution over time, their typology, but also structural aspects of the gender of the people involved in their management and the proportion of the various organizations involved in the partnership.

Step two concerned a qualitative analysis of the perceptions of the actors involved in the LAG and their beneficiaries, through a survey through privileged interviews at the level of three LAGs in the North-East Development Region of Romania. The issues covered were the strategic guidelines and the projects supported, but also the difficulties encountered in achieving the partnership and in supporting their development efforts.

2. SOCIAL INNOVATION AND SUSTAINABLE DEVELOPMENT IN RURAL SPACE

Social innovation is often indicated as an essential point of innovation in rural space. In the debates on the orientation of the common agricultural policy (CAP), the modernisation of agriculture and multifunctional rural development are positioned as contradictory paradigms or as distinct keys for achieving sustainability objectives. Within the paradigm of multifunctional rural development, fundamental social change - in organisation, behaviour and values - is essential, and within this model of change, social innovation appears as a critical part of the solution and the conjoint learning process (Bock, 2012). Changes in urban and rural lifestyles require innovation. Social change leads to the crossing of borders between rural and urban areas and involves a redefinition of the relations between these environments, by mutual borrowing furthermore the spread of new attitudes and values. Modernization processes oriented strictly towards economic objectives, of the productive type, are replaced by the paradigm of regional and local ecosystems of community improvement.

Despite the fact that social innovation appears to be one of the determinants of outstanding regional and rural progress, its function is usually undervalued. Issues of social innovation are not directly concerned in financing programmes, with the main reason for the uncertainties that accompany this concept and its modalities of implementation (Neumeier, 2012).

The essential aspects of regional development aim to identify the societal challenges of rural decline, outline initiatives to boost rural attractiveness through innovative forms of social service delivery, develop solutions and implement solutions through micro-projects. Interaction in social innovation processes must be carried out by actors considered most relevant, with a real connection in the territory and who know the individualized needs of communities. Real collaboration between authorities and local communities delivers a basis for the active public sector to engage in social innovation. Sustainable innovation of social services at local level requires unlimited access to basic services offered by the public system in a top-down approach, while providing a framework to individualised and diversified initiatives in the bottom-up approach (Lindberg, 2017).

Understanding the nature of social innovations incorporates several aspects (Butkevičian, 2009): cultural acceptability, economic sustainability and technological feasibility should characterise them. Knowledge sharing, individual entrepreneurship, social networks, social capital and bottom-up initiatives facilitate the development of social innovations in rural communities. Social innovation should lead to concrete results such as new services, education, organic farming.

In the literature it is widely recognized the important role that innovation plays as an engine of economic growth and development and which is the central element of the concept of knowledge-based economy. On the other hand, the importance of networks and social relations is underlined, also the promotion of innovative development initiatives. Such initiatives require processes of cooperation and collaboration between local actors (authorities, companies, civil society), who possess knowledge and expertise in different fields and who can contribute to the generation and application of innovations. In this context, LEADER initiatives can be seen as true 'innovation laboratories' characterised by a change of perspective in the design and implementation of rural development policies, from sectoral policies centred on agriculture, to multi-sectoral development policies implemented by promoting multi-stakeholder initiatives based on broad partnerships between all local actors (Dargan & Shucksmith, 2008). Thus, there is a need for integrated management of local resources that can contribute to the sustainable development of rural areas, with a view to making use of them in local programmes and projects, where human resources are the most important.

In terms of sustainable management of local resources involved in the rural development process, several important aspects have been highlighted (Dargan & Shucksmith, 2008):

- continuous resource renewal - sustainable management of renewable resources;
- the way of life and continuous improvement of the quality of life in the utilitarian sense (access to resources and utilities), aesthetics (quality and aesthetics of the natural environment) or well-being (health, happiness, etc.);
- Participatory resource management – collaboration and cooperation and all entities related to or interested in the conservation of local resources. The future of rural development depends on

meeting the sustainability condition, which involves sustainable management of local resources and involves the combination of knowledge from different fields and requires the involvement and collaboration of all stakeholders to harness their knowledge and expertise in the design and implementation of development programmes, strategies and projects. Thus, LAGs initiatives can be seen as rural development experiments and models in which the capacities of all local actors are managed, regardless of their field of activity/ expertise.

Given the multi-disciplinary nature of the concept of sustainable rural development, its application requires interdisciplinary collaboration in research activity but also harnessing the synergy capacity of all stakeholders in collaborative and cooperative initiatives, each contributing with their own knowledge and expertise (Bruckmeier & Tovey, 2008).

3. MULTISTAKEHOLDER MODEL AND OPERATIONALIZATION THROUGH LOCAL ACTION GROUPS

The sustainable development of the rural area starts from the premise of harmonising (agreeing) the economic, social and natural (ecological) problems faced by rural areas in the process of catching up on the different aspects of well-being towards urban space and in solving all the crisis phenomena they face (Mölders, 2013). The concept of sustainable development is based on two fundamental principles: that of social justice (intergenerational equity) and that of the integrated approach to the needs/interests of stakeholders living or having interdependence links with the rural area.

The integration of sustainability objectives may not always be clear. A declarative or superficial level of integration of these objectives can be highlighted both in funding programmes and at the level of local initiatives (Manolescu et al., 2019). Since the concept of sustainable development is a multidimensional one and aims to raise the level of well-being and quality of life of all rural stakeholders, divergent views, objectives and interests may emerge which need to be harmonised in the development and implementation of programmes, plans or projects aimed at the development of rural areas. Thus, rural development policies and programmes initiated by the European Union are based on stakeholder and multi-level governance approaches, in which negotiation processes are created with a view to harmonising the interests of public and private actors linked to a particular territory/space (Marks 1993; Bache & Flinders 2004). This complex harmonisation process involves multi-stakeholder approaches in which different local/zonal/regional entities collaborate on different levels. In other words, the sustainable development of the countryside is shaped by stakeholders who share different values, have different visions of the entire development process, have their own interests and objectives (Murphy & Chataway, 2005).

The delimitation of the economic and social sectors and the areas of interference between them is the process that generates the actors within the partnerships and their characteristics. At the interface of the public sectors, civil and private for profit there can be joint initiatives, both ways, with the aim of solving common problems and harnessing the specific competences of each actor. Zona of public – private - non-profit interference, which can include business incubators, clusters and local and regional initiative groups (Arustei et al., 2014) demonstrate the possibility of harnessing the synergy of the mechanisms of the three sectors, constitute the operational framework of the multi-stakeholder model. These partnerships that can involve actors in a deep process of prioritization, foundation and commitment, characterize a well-developed institutional system.

Public Private Partnerships (PPPs) are instruments that are frequently used in governing sustainable development in the context of the European Union. PPPs are collaborative/associative structures in which actors from different spheres of society (authorities, economy, civil society) engage in non-hierarchical processes to achieve common interest goals (Bjärstig & Sandström, 2017; Van Huijstee et al., 2007). The establishment of public-private partnerships regardless of their name (public-private networks, multi- or multi-sectoral networks, multi-stakeholder networks) is based on voluntary agreements between public and private entities, helping to raise the level of well-being, in its many forms, by delivering public goods or utilities.

LAGs are such partnerships set up with the aim of initiating coordinated activities at local level to harness the competences and resources of members for sustainable rural development. Social partners involved in such partnerships perform different roles:

- public authorities have a decisive role to play in initiating, structuring, financing, regulating their development and monitoring;
- private actors, in particular heritage organisations, are intended to provide expertise in various fields and funding enabling the association's operational management;
- NGOs are intended to promote and support actions of common interest. The involvement and distribution of power or influence in such partnerships depends on the objectives pursued and can be limited to providing advice in the development of policies or strategies, or can materialise in assuming an operational role, such as: initiating, evaluating, implementing and monitoring projects (Bjärstig & Sandström, 2017).

Local Action Groups are designed as an ad hoc framework for the exchange of ideas, for debates on issues of local interest and for stimulating economic activity initiatives. These local partner structures can self-organize on very real areas and problems and at the urging of local authorities (Mosora, 2012).

Problem assessment, deliberation and negotiation processes can be negatively influenced by imperfect information, as well as by human inability to process information correctly. Each actor in the partnership comes with a cultural baggage influenced by historical, socio-cultural, political and economic aspects, and if decisions were taken unilaterally, it would thus limit the understanding and implicit impact of the decision (Prasad Pant & Hambly Odame, 2006).

The benefits of multi-party processes include (Häring et al., 2009): quality; credibility; increased likelihood of impact and implementation; social gains. The expected results from such processes involving several stakeholders are diverse; how knowledge is produced and spread depends on distinctions between key players, as well as perspectives, interests and expectations. Based on the principles of good governance, multi-stakeholder approaches represent an effective application of the principle of participatory management.

A balance of decision-making forces can be achieved by keeping at regional level areas where expertise is lacking at the local level, but most tasks are transferred to the local level (Medeleanu, 2013). Before any change in territorial organisation, the institutional system of regional development must be carefully analysed and the cultural adequacy of the new models evaluated (Talmaciu, 2015). The approach must be gradual, with constant feedback and flexibility. The balance between local, community and regional levels must be closely monitored from one stage to the next, and the use of positive results and experience gained must be pursued.

LAG associative initiatives enable the endogenous and exogenous sources of development to be exploited by promoting the concept of 'multi-level governance'. This involves achieving the objectives of rural development by making greater use of the creativity and knowledge potential of local actors and by involving all stakeholders in initiating projects that help to raise the level of well-being and quality of life of rural residents. LAGs started on the basis of the LEADER (*Liaisons entre actions de développement de l'économie rurale*) initiative between representatives of local public administrations, representatives of the economic environment and representatives of civil society shall favour the design and implementation of heterogeneous rural development plans involving all actors and initiating actions towards prioritising local development objectives and projects (High & Nemes, 2007). They are intended to provide the necessary framework for promoting innovative initiatives that train and harness endogenous resources: economic, financial, human, cultural, natural, know-how, etc.; by boosting the creativity potential of all actors at local level.

LAG initiatives are closely linked to the concept of social economy which has characteristics: promoting the citizen spirit, social involvement and inclusion, focusing on citizens' issues, participatory approach to local issues, multistakeholder governance and promoting the concept of endogenous development (High & Nemes, 2007). The work of local action groups is based on two important aspects:

- the creation of stakeholder networks that foster learning processes from the experiences of others and knowledge transfer;

- engaging local stakeholders in participatory processes for developing development plans, programmes, strategies and projects that promote the exploitation of local potentialities, in line with the local cultural and institutional context.

A challenge for local action groups (associative initiatives in general) is the tensions that may arise between local and external actors in initiating development projects, food tensions in the way of exercising power and control. Tensions cause instability in any associative initiative and can be mitigated by including representatives of all stakeholders.

At practical level, the accomplishment of multilateral processes essentially relies on the disponibility of distinctive actors to participate and investing energy in the decision-making process without expecting immediate and/ or direct reward. Key players felt the need to take part in such a process because of their expectations to positively influence the future of their community. The regulatory incentives involved in joining the European Union and the need to restructure rural financing programmes, the need to highlight the role of sustainable agriculture in this framework has provided the necessary incentive for the successful involvement of actors in shaping local multi-stakeholder action groups.

An innovative tool has been proposed (Thabrew et al., 2009) to support the planning and implementation of initiatives - Stakeholder Lifecycle Assessment (SBLCA). SBLCA provides support for the decision and can be used in the structuring and analysis of multi-stakeholder associations and, at the same time, to map groups potentially affected by different economic, social and environmental aspects. This generates both quantitative and qualitative information, and together with the knowledge of stakeholders contributes significantly to improving understanding of problems and leads to greater transparency. This can reduce uncertainty and reach a consensus between stakeholders more quickly.

The creation of a multi-party platform has been promoted in recent times as a way to generate agricultural development (Adekunle & Fatunbi, 2012). The Platform allows dialogue with several stakeholders from different international fora, with the aim of increasing productivity in sectors and deficient areas. Each stakeholder group shall perform the task best done on the basis of competences, scope, resources and operation. Private sector practitioners focus on generating profit among stakeholders along the value chain, while public sector stakeholders generate the various results needed for promotion within the public service system.

Multi-stakeholder platforms (MSPs) are seen as a promising tool to increase the impact of rural development. By increasing collaboration, knowledge exchange and mediation influence between farmers, researchers and other stakeholders, it can be assumed that MSPs improve the ability to innovate and assist the expansion of innovations in rural areas. However, there may also be inadvertencies between collaboration, knowledge exchange and influence networks: NGOs and the private sector are, respectively, over- and under-represented in MSP networks, links between local and higher levels are fragile, and the organisations with high notoriety are often not part of MSPs. Collaborations and innovations occur between the same type of organizations (Hermans et al., 2017).

Six key factors were identified as particularly important for successful participation processes (Neumeier, 2017): (1) commitment and (2) the skills of participating actors; (3) organisational structure; (4) the quality of the functional concept; (5) the climate of acceptance/cooperation and (6) access to financial resources.

Negotiations between several stakeholders promised greater visibility, compromises and democracy in decision-making in relations between different interest groups. Thus, the negotiations allowed disadvantaged groups such as small farmers and local producers to come to the public's attention and negotiate formal agreements with strong stakeholders such as corporations, international environmental NGOs, government and local elites. These processes have been increasingly recommended as a means of facilitating public interest decisions and generating collective action in the direction of community development.

It has been pointed out, however, that these benefits for disadvantaged groups depend on how negotiations are undertaken. In some cases, abuses of power and inequity are found under the guise of multistakeholder negotiations (Edmunds & Wollenberg, 2002). Under the appearance of the consensus given by collective discussions, one can exaggerate the level of agreement reached through

negotiations and expose disadvantaged groups to more manipulation and control by stronger stakeholders. In-detail, the participants' detailed information on the groups/ interests represented by the organizers and facilitators, the creation of the possibility of achieving alliances between disadvantaged and powerful groups, the encouragement of the expression of disagreement or doubts, the perception of negotiations as a long-term iterative process and the monitoring of impact and the adjustment of strategies to support disadvantaged groups help to alleviate manipulation problems.

The multi-stakeholder and multi-level governance approaches specific to LAGs initiatives, adopted on the basis of the Leader programme, are characterised by a paradigm shift from one to one of control, to one of cooperation and coordination of efforts, through mechanisms that guide the behaviours of networks of economic, social and political actors (Stoker, 1998; High & Nemes, 2007). Local Action Groups (LAGs) can be seen as institutions based on social contracts, providing an appropriate framework for negotiating and distributing power and influence relations in relations between rural actors, according to North's conception (1990). They may provide the necessary levers for the decentralisation of development processes to regional and local levels, where the influence of civil society representatives and the business environment increases in relation to the authorities (central or local). In this way, there is the possibility of transition from centralist approaches (in which localities/peripheral areas serve the political and economic interests of the central regions), to decentralised approaches, which put the interests of local stakeholder networks first, are the result of a good knowledge of the local context and which promote local control of development processes and benefits.

4. ANALYSIS OF LOCAL ACTION GROUPS IN ROMANIA

Local action groups can represent a real opportunity for the development of Rural Romania and, by implication, for the revitalization of small towns included in such structures.

In Romania, Local Action Groups (LAGs) were organized as a formal partnership that brings together private, public and civil society organizations from a rural territory, to which small cities were subsequently added, with the aim of implementing LEADER methods. The size of the covered territory ranges from about 10,000 inhabitants (5,000 inhabitants for the Danube Delta), to areas with about 100,000 / 150,000 inhabitants. LAG members mainly include representatives of local authorities, business groups, social organisations and environmental associations. The main advantage is that it centralises a vast knowledge base on skills and ensures fair coverage of interests.

Following the evolution of the LAG over time, the following mentions can be made: the number of LAGs increased in the two stages of funding from 163 to 239 (double the scheduled level of 120); the majority of LAGs established in the first stage continued their work; area covered at national level has reached 90%; they have diversified – fishing LAGs and urban LAGs.

The econometric correlation between the amounts allocated to LAGs, the population of each LAG and the development index (Mosora, 2012) was tested. The low correlation value is explained by the use only of the publicly financed value for the preparatory phase as a dependent variable. Noteworthy is the negative coefficient associated with the development index of the commune, which shows compliance with the orientation of the formation of LAGs especially in the poorer areas of Romania. On the other hand, the low influence of the total population seems to be paradoxical given that one of the four selection criteria relates to the number of inhabitants in LAGs. It seems that the eligible value is more related to the type of economic project around which each LAG revolves, rather than its demographic size, even if the impact factors of project implementation must also take this into account.

Through the proposed strategies, the LAG has as its priority the resolution of structural problems of sustainable rural development: reduced administrative and community capacity; lack of qualified human resources; poor infrastructure; low quality of life; low economic attractiveness. The bottom-up approach takes into account that the implementation of projects with impact at the micro-region level is difficult due to the lack of working practice in partnership, lack of qualified human resources (Iatco et al., 2008).

The functions performed by LAGs are increasingly complex. Thus, a new challenge arose in the 2014-2020 financial year, as a result of the obligation imposed by the European Union on LAG-s to carry out the evaluation of the implementation of local development strategies (Ministry of Agriculture and Rural Development, 2018). While at first glance the conduct of such an assessment may seem a "burden" for LAGs with a reduced organisational capacity, beyond the obligation to meet an EU-imposed requirement, the benefits of the assessment can be discovered and harnessed for both the success of local development strategies and the learning process within the Local Action Groups.

4.1. Results of documentary analysis and discussions

In Romania, the associative initiatives of the LAG type have known a continuous evolution since 2006, when the first multi-stakeholder initiative of this type was established, representing 0.42% of the country's territory and 0.1% of the total population. Thus, according to the data in Table 1 in 2017, the number of LAGs reached 239, occupying 88.57% of the territory and 49.85% of the country's population. A strong dynamic of this type of initiative was registered after the country's accession to the European Union on January 1, 2007. Thus, at the end of the 2007-2013 programming period, 123 LAG associations were registered, representing 49.39% of the territory and 28.48% of the population, and by the middle of the 2014-2021 programming period their number doubled, covering almost the entire Romanian rural area.

Table 1 Evolution of LAGs in Romania

Year	New established LAG	No total LAG	Occupied Area (Kmp)	Share in Total Area of Romania	People no.	Share of total population
2006	1	1	991,4	0,42	19654	0,10
2007	4	5	5312,95	2,23	190356	0,97
2008	1	6	5847,13	2,45	225781	1,15
2009	10	16	19494,94	8,18	699925	3,56
2010	27	43	46384,21	19,46	1978852	10,07
2011	24	67	71111,28	29,83	3062130	15,59
2012	38	105	106677,38	44,75	4821756	24,55
2013	18	123	117575,13	49,32	5594430	28,48
2014	16	139	128490,45	53,90	6114022	31,12
2015	41	180	164439,97	68,98	7698265	39,19
2016	57	237	209771,15	87,99	9707170	49,42
2017	2	239	211146,74	88,57	9793458	49,85

Source: author's calculations

A feature of this type of partnership is the instability of membership. Thus, some local action groups have experienced withdrawals of members and the integration of new members, from one period to another. The average size of a national LAG is 876.12 Kmp / LAG and 40,977 inhabitants / LAG. From the data in Table 2 we can see some homogeneity of the average size of a LAG in the case of 6 development regions, except for the two most developed regions: Bucharest Ilfov Region (predominantly urban) where the average size is much smaller in area and population and the Western Region where the average area of a LAG is almost double.

Regarding the distribution of the LAG in Romania by gender of the president and executive manager (table 3), it can be seen that in the case of the president the male gender predominates (almost 75%), and in the case of the executive manager a relatively balanced distribution between the two genders (54% male executive managers and 46% female).

Table 2 LAG size by development regions

	Surface	Population
--	---------	------------

Region	No GAL	Total (Kmp)	Average (Kmp/GAL)	Total	Average (Loc./GAL)
North West	31	27318,36	881,237	1216661	39247,1
Center	34	30058,81	884,083	1122820	33024,1
North East	45	35134,66	780,77	2112876	46952,8
South East	36	31630,53	878,626	1230093	34169,3
South Muntenia	42	31862,65	758,635	1967974	46856,5

Table 3 Distribution of LAG by gender of President and Executive Manager

	Female		Male	
	number	%	number	%
Gender LAG President	60	25,1	179	74,8
Gender executive manager	92	46	108	54

Source: author's calculations

Regarding the distribution of the members of the board of directors and the executive team by the two genders (table 4) the following can be observed:

- in the case of the board of directors, the male members predominate. Thus, in 148 LAGs, out of the 179 for which information was available, over 50% of the members are male, and in 143 LAG associations the female members represent less than 50%. In 31 LAGs 100% of the members are male and in no case do we have 100% female members.

- Regarding the gender of the members of the executive team, the situation is the opposite. Thus, in about 70% of cases over 50% of the members of the executive teams are female.

Table 4 Gal distribution by gender of board members and executive team

Share	Board of Directors		Executive team	
	M	F	M	F
100%	31	0	13	11
80% - 90%	55	4	5	18
70% - 80%	21	6	7	30
60% - 70%	28	12	24	31
50% - 60%	13	14	30	30
under 50%	31	143	93	53

Source: author's calculations

Regarding the distribution of the LAG by the origin of the president (Table 5) it can be seen that in 44.77% of the LAG the president comes from the public sector (representatives of local public authorities), in 32.64% from the private sector, 18.83% they are NGO representatives and only 3.77% come from individuals.

Table 5 Distribution of LAG by provenance of the President

Region	No GAL	Public		Private		NGO		Individuals	
		No.	%	No.	%	No.	%	No.	%

North West	31	12	38,71	8	25,81	7	22,58	4	12,90

Total	2814	25,41	6174	55,75	2004	18,10	82	0,74	11074

Source: author's calculations

Table 6 shows the distribution of LAG members by origin. Thus, it can be observed that at national level the largest share is held by members of private companies (55.75%), followed by members belonging to the public sector 25.41%, NGOs, 18.1% and only 0.74% individual members.

4.2. Results of qualitative analysis and discussions

The privileged interviews were conducted in three LAGs in the North-East Development Region of Romania. The investigation was used by semi-structured interview. Interviewees were members of the LAG leadership, but at the end of the meeting there were also members of the community beneficiary of the projects carried out. The issues concerned were the evolution of the strategic guidelines, a review of the sustained projects and their results, as well as managerial aspects regarding the structure of the LAG and the way of decision-making, as well as the difficulties encountered in achieving the partnership and supporting their development efforts.

The most important aspects mentioned in the interviews can be summarised as follows:

- In all 3 LAGs there was continuity both temporal (it was established from the first stage) and at the level of the structure of partnership, management and strategic and operational orientations;
- The most important projects were aimed at the development of infrastructure and equipment of local public authorities, for the provision of extensive public services and high quality;
- among the issues flagged by the representatives of the three LAGs are:

(1) Reduced managerial and operational capacity - staff working in the LAG do not have adequate training for the necessary strategic analyses nor are they in sufficient numbers to be able to undertake the activities at the operational level. This weakness is also supported by the conclusions of the analysis at the national level. Thus, the PNDR Analysis Report (<https://www.madr.ro/axa->

leader/leader-2014-2020.html) shows that 64% of LAGs say they turn to external consultants for documentation and local development strategies. There are also difficulties in implementing and monitoring their own projects and strategies, only in recent years the specific procedures of this evaluation activity appear, the implementation of specific procedures requiring time. As structures have been established for a relatively short time and partnerships not common at the social level, LAG management declares that they have little autonomy compared to other countries, this being empirically highlighted from the meetings and exchanges of experience conducted with LAG staff from other countries. Given the financing conditions, the syndrome of spending money on the last hundred meters often occurs, which decreases the capacity to plan and implement the steps considered relevant, the rapid spending of the budget being the priority.

(2) Poor communication - flagged at all levels. Thus, potential beneficiaries are unaware of the funding opportunities offered by LAGs, and lag management is accused of poor education by many local producers. Meetings organised by the county and national authorities are considered appropriate, but participation is limited. The materials provided by their network are appreciated, this being highlighted by the results of the studies carried out, in which the LAGs show that they appreciate the meetings organized by RNDR and FNGAL, and more than 90% of respondents consider the published support documentation to be useful or very useful. Poor internal communication capacity, lack of administrative staff is also due to reduced involvement in international studies. Thus, Romania is nominated in the report on the results of a global survey (<https://www.rndr.ro/leader.html>) on the implementation of LEADER at the level of EU LAGs as being among the countries with the fewest LAGs responding to this survey (8%), together with Hungary (7%).

(3) Statutory ambiguity - LAGs were declared ineligible on certain programmes/measures to which applicants could not be public actors, which limited the ability to make progress in certain areas financed by EU programmes. Although the decision-making power belongs, according to the agreement, to the private sector (public actors do not usually exceed 40% of all partners), the perception is that, in fact, LAGs are under the direct influence of mayors/political power, which can lead to a decrease in confidence on the part of the population, the tendency to change the staff involved in the LAG and a lack of continuity of local strategies.

Although many problematic issues specific to each area have been flagged, at all three meetings possible solutions have been outlined, which can be implemented at the level of local and regional partners. It has been pointed out that from an organizational point of view the trend is positive, over time the LAG acquires new functions and the activity within the network at the national level is dynamic and offers consistent support.

5. CONCLUSIONS

The multi-stakeholder model is considered a basic tool for the adequacy of the steps at regional and local level, there are many studies that demonstrate the effectiveness of its application. Being an extensive partnership, between organizations, groups and people with different cultural baggage, takes all the advantages but also the disadvantages of their interaction. Innovative tools - such as multi-stakeholder platforms - can support dynamic, extensive and efficient collaboration. Although many negative elements are recognized in the conduct of LAG activities - lack of strategic orientation, many LAGs being small or medium in size, documentation inappropriate to administrative capacity, insufficient resources allocated, reduced autonomy due to the early stage of development, but also the traditional structuring of power centers, there is no denying their potential role in the animation of communities, so necessary in the context of major regional imbalances and between rural-urban spaces.

Future research may target specific power structures, ways in which the interests of disadvantaged groups are supported, perceptions of transparency.

Possible solutions to increase strategic and operational capacity and to increase the impact of LAG actions are in the direction of professionalization of staff – by identifying the needs of competence and offering certification training programs, by offering individualized consulting, by organizing consulting services at the level of national networks, by regulating the status and eligibility of the

LAG's participation in non-refundable programs. Reputational growth, through targeted actions and a sustained communication plan, transparency growth and a prioritization based on local realities are permanent objectives of these structures.

The role of public and private investments in economic growth. The case of Albania

PhD. Jorida Koçibelli¹

Assoc. Prof. Eleni Vangjeli²

¹ Finance- Accounting Department, University Fan S.Noli, Korçë, Albania, agollijorida@gmail.com, ORCID:0000-0003-3055-2888

² Finance- Accounting Department, University Fan S.Noli, Korçë, Albania, elenivangjeli@yahoo.com, ORCID:0000-0002-2506-4225

Abstract:

Research background: The role of investments in the transformation of transition economies and especially Albanian economy, which inherited deep structural deformations, is very important. The article indicates some of the main features of public and private investments in Albania and aims at arguing that public investment has a positive impact on GDP, the private investments affect negatively the economic growth level and this effect is not statistically important and the effect of foreign investment is negative and significant also. All of these call for correction of the economic policy and more active role of the state.

Purpose of the article: The main aim of this article is to study and analyse the impact of investment especially public and private investment on the economic growth, because it is one of the most important indicators that shows how an economy perform. We have analyzed the mutual effect of selected factors on the economic growth level in long-run and short-run. The selected factors are: domestic investments, private investments, FDI.

Methodology/methods: To calculate the impact of those factors on economic growth was used time series data for the period 1998 – 2017. Relying on time series data were made regression and correlation analysis using SPSS-20 program.

Findings: Based on the testing results, we conclude that public investments affect positively the economic growth level and this effect is statistically important, FDI affect negatively the economic growth level and this effect is also statistically important and the private investments affect negatively the economic growth level and this effect is not statistically important. .

Keywords: *Economic growth; Public investment; Private Investment; Co-integration; Granger Causality.*

1. Introduction

Albania is a small developing country, its economic performance and growth have been influenced by the impact of internal and external factors. Among the most important internal factors include trade policies and reforms in the financial system. External factors are the economies of the largest trading partners, increased services, FDI, competitiveness and the index of corruption. All of these factors are expected to have different impacts on promoting our country's economic performance. In retrospect, Albania has presented a history of successful development in many aspects, ranging from intensive efforts to establish a market economy, reforms aimed at improving the business climate and economic partner in accordance with the membership requirements in BE and even faster integration into the European international community. Over the past two decades, economic growth has been rapid and steady, and unlike the Balkan countries, Albania has submitted a positive upward trend even during the global economic crisis, despite a significant decline in 2009-2010 (at the time when the effects of the world crisis were felt in Albania). The decline of foreign demand, the increase of uncertainty, the tightening of financing arrangements and the use of foreign funds by the region have stunted the economic activity and identified a number of structural problems. Characteristic in the case of Investments is the fact that private investment and FDI follow the real GDP growth line. Public investment has grown the most in times of economic recession (2008 case), public investment increased by 65% compared to a year earlier, at the time of the largest annual growth. The upward trend continued for 2009 as well. In absolute terms, the highest level of public investment was recorded in 2009 at ALL 95.9 billion. Following the steady decline in public investment throughout 2010-2018, 2018 also saw the highest level of public investment since 2010. This budgeted level amounts to ALL 86.4 billion. During 2004-2018, on average, 64% of public investment was financed from internal sources, while 36% from external sources. Each year public investments are dominated

by high levels of domestic financing, with the exception of 2012 where only 44.5% of public investments are financed from domestic sources. 2007 represents the year where public investments are mostly financed from domestic sources, with about 85% of them. In 2016 and 2017, the ratio of internal financing and external financing remained unchanged, where 64% of public investments are from internal financing and 36% from external financing¹.

Graph.1: Public investment, private investment, real growth GDP, FDI during 1998-2017

Source: Elaboration of authors, Database: INSTAT, Ministry of Finance (1998-2017)

Albania's average economic growth during 2000-2008 (pre-crisis period) was at level of 6.2%, being above the average of 5.3% of CEE countries, while the average inflation rate for this period was 2.7%, well below the average of 8.5 % of CEE countries. During 2009- 2011 (crisis and post-crisis period), the Albanian's economy was performed at an average growth rate of about 3.1%, while average inflation was at level of 3.2%, below the average inflation of 3.7% in CEE countries. Albania's impressive economic growth over the past decade is an important achievement. Policies are constantly being taken to keep growth steady and with a positive upward trend from year by year.

2. Literature Background

There is a large number of studies for the relationship between the investments's types with the economic growth, concluding that the impact was positive for different economies, while for other economies the result of this relation was negative. The causes were different, but the investment's size and allocation in priority economic sectors remained the determinants in the effectiveness of economic growth. Relying on several studies conducted, many authors around the world, such as: **Ellen R. McGrattan (2012)**, **Steve Loris Gui- Diby (2014)**, **Simon Feeny**, **Sasi Iamsiraroj**, **Mark McGillivray (2014)**, **Blomström Magnus ; Persson Håkan (1983)**, **Beugelsdijk, Sjoerd; Smeets, Roger; Zwinkels, Remco C.J. (2008)**, **Borensztein, Eduardo R.; De Gregorio, José R.; Lee, Jongwha (1998)**, **Panagiotis Pegkas (2015)** have concluded that there is a positive relationship between investment and economic growth. On the other hand, several authors such as: **Mohamed Abdouli; Sami Hammami (2017)**, **Masron, Tajul Ariffin; Hassan, Mohd Khairul Hisyam (2016)**, **Tafirenyika Sunde (2017)**, **Soo KhoonGoh, Chung Yan Sam, Robert McNow (2017)** argue the fact that investment, especially foreign direct investment have no impact on economic growth, even though they are considered as a component of GDP. The following studies bring another perspective of the impact of investment on economic growth: According to **Chaido Dritsaki, Emmanouil Stiakakis (2014)** confirm a bidirectional long-run and short-run causal relationship between foreign direct investments, exports and growth. **Sasi Iamsiraroj (2016)** also argued that there is also a possibility of a bi-directional relationship between FDI and economic growth. According to **Khan and Kumar (1997)**, public investment can also crowd out private investment when it produces goods and services that compete with the private sector. For the scanty empirical studies that have considered the relative importance of both public and private investment on economic growth, conflicting arguments and

¹Referring to publications and statistics from Ministry of Finance

results have been reported (**Crowder and Himarios, 1997; Khan and Kumar, 1997; Nazmi and Ramirez, 1997; Odedokun, 1997; Yang, 2006**). Meanwhile the existence of a bidirectional relationship between FDI and economic growth have proved: **Sasi Iamsiraroj; Samuel Adams; Eric Evans Osei Opoku and Chaido Dritsaki, Emmanouil Stiakakis** but in some case foreign direct investment do not have the expected positive impact on the economic growth because there are other factors that indicate each other.

Another point of view is given by the authors **Blomström Magnus; Persson Håkan** (1983). They argued the fact that if there is a positive relation between efficiency of domestic plants and the foreign participation of various industries they concluded that there is a spillover of technical efficiency. An earlier study realized from **Blejer and Khan** (1984) evidenced that public investment in infrastructure is complementary to private investment, while other types of public investment lead to crowding out of private investment. **Landau** (1986) used OLS method, examines the relationship between government expenditure, revenue and economic growth. The result indicates that each type of expenditure has either significant negative or insignificant positive effect on economic growth.

In more details in their study **Easterly and Rebelo** (1993) find that only public investment in transport and communication generates positive effect on economic growth for a mixed sample of both developed and developing countries. But this point of view is contested by **Deverajan et al** (1996) where in their result show that public capital expenditure has a negative effect on economic growth for developing countries, and the effect dramatically reverse for developed countries. Accord to them, these expenditures normally considered productive could become unproductive if there is an excessive amount of them. According to **Khan and Kumar (1997)**, public investment can also crowd-out private investment when it produces goods and services that competewith the private sector. This is especially so when the State actively participatesin commercial sector projects where the private sector is known to be moreefficient and has a higher and increasing marginal productivity than its counterpart. This economic arrangement would choke private investment growth through its displacement in the product market **Borensztein, Eduardo R.; De Gregorio, José R.; Lee, Jongwha** (1998) concluded that FDI contributes to economic growth only when a sufficient absorptive capability of the advanced technologies is available in the host economy. **De Mello** (1999) founds positive effects of FDI on economic growth in both developing and developed countries but conclude that the long-term growth in host countries is determined by the spillovers of technology and knowledge from the investing countries to host countries. This partial correlation between public and private investment was studied by **Everhart and Sumlinski** (2001). They find some evidence of a negative correlation appears to be positive for the countries with better institutions.

Carkovic dhe Levine (2002) argued that FDI can cause the collapseof the local industry that do not have the technology and cannot afford the competitiveness of foreign firms investing in developing countries. Due to the spillover, know-how and domestic crowding effects, the firms shrink in short-run causing a negative correlation with economic growth. **Alfaro** (2003) suggests that total FDI exerts an ambiguous effect on growth. Foreign direct investments in the primary sector, however, tend to have a negative effect on growth, while investment in manufacturing a positive one. **La Struga** (2005) explore that impact and in his result show that both public investment and FDI have a positive relationship with economic growth. A significant study has been done by **Beugelsdijk, Sjoerd; Smeets, Roger; Zwinkels, Remco C.J.** (2008) for the impact of horizontal and vertical FDI on host's country economic growth. They found that horizontal and vertical FDI have positive and significant growth effects in developed countries. Moreover, their results indicated a superior growth effect of horizontal FDI over vertical FDI. In line with existing literature, they found no significant effects of horizontal or vertical FDI in developing countries. **Vu and Noy** (2009) in their results show that FDI has a positive effect on economic growth directly and through its interaction with the work. Moreover, they find that the effects appear to be very different in different countries and economic sectors. According to **Ellen R. Mc Grattan** (2012) shows that the lack of empirical evidence is consistent with theory if countries are in transition to FDI openness. Although no systematic benefits of FDI openness are found, the model demonstrates that the eventual gains in growth and welfare can be huge, especially for small countries. **Jen-Eem Chen** (2012) claimed that there exists a positive long-run relationship between outward FDI and growth as well as long-run bi-directional causation between them. In the short-run, we do not find Granger-causality between outward FDI and growth. **D. Gomes Neto, FJ Veiga** (2013) studied empirically the

role of foreign direct investment on growth through the diffusion of technology and innovation. The authors found that these two mechanisms have a positive effect on productivity growth and GDP growth. **Steve LorisGui-Diby** (2014), studied the impact of foreign direct investments on economic growth in Africa. They found that FDI inflows had a significant positive impact on economic growth. The scarcity of qualified human resources did not limit the impact of FDI. **Simon Feeny, Sasi Iamsiraroj, Mark Mc Gillivray** (2014) concluded that FDI is associated with higher rates of economic growth in the Pacific. A 10% increase in the ratio of FDI to host Gross Domestic Product (GDP) is associated with higher growth of about 2% in all countries on average. In their article Mohammed Ameen Fadhi, Mahmoud Khalid Almsafir found out that FDI inflows together with the human capital development contribute strongly to the host country's economic growth. But the technology spillovers of FDI inflows are still not sufficiently combined with human capital to contribute to the economic growth. **Panagiotis Pegkas** (2015), in his empirical analysis reveals that there is a positive long-run cointegrating relationship between FDI stock and economic growth. The results also indicate that the stock of foreign direct investment is a significant factor that positively affects economic growth in the Eurozone countries for the 2002–2012 period.

The following studies bring another perspective of the impact of investment on economic growth: According to **Chaido Dritsaki, Emmanouil Stiakakis** (2014) confirm a bi-directional long run and short run causal relationship between foreign direct investments, exports and growth. The results of the research indicate that foreign direct investment do not have the expected positive impact on the economic growth. **Samuel Adams; Eric Evans Osei Opoku** (2015) show that both FDI and regulations (total regulations, credit market regulations, business regulations and labor market regulations) do not have an independent significant effect, however, their interaction has a significant positive effect on economic growth. **Sasi Iamsiraroj** (2016) also argued that there is also a possibility of a bi-directional relationship between FDI and economic growth. Results from the estimation indicate that overall effects of FDI are positively associated with growth and vice versa; whereas labor force, trade openness and economic freedom are other key determinants of FDI, which in turn stimulate income growth further.

Masron, Tajul Ariffin; Hassan, Mohd Khairul Hisyam (2016) observed that there is no guarantee that FDI inflows into various sectors within manufacturing industry will generate positive externalities. **Mohamed Abdouli; Sami Hammami** (2017) concluded that there is unidirectional causality from FDI inflows to economic growth. In his article, **Tafirenyika Sunde** (2017) confirmed cointegration between economic growth, foreign direct investment and exports. It indicates that both foreign direct investment and exports spur economic growth contrary to some studies, which found that FDI does not cause economic growth. **Soo Khoon Goh, Chung Yan Sam, Robert McNown** (2017) used a newly developed cointegration test, the bootstrap autoregressive distributed lag (ARDL), to examine long-run relationship among foreign direct investment (FDI), exports, and gross domestic product (GDP) in selected Asian economies. Their tests fail to find evidence of cointegration when GDP is the dependent variable. The absence of a long-run forcing relation from FDI and exports to GDP implies that FDI and exports were not the sole sources of economic growth in that economies. **Jai S. Mah** (2010) examines the causality between FDI inflows and economic growth in case of China using a small sample cointegration test. The empirical results show that since economic reform FDI inflows have not caused economic growth, but the latter has caused the former. Anis Omri, Bassem Kahouli (2014) in their empirical results show that there is bi-directional causal relationship between foreign investment and economic growth, as well as domestic capital and economic growth, and there is unidirectional causal relationship from foreign direct investment to domestic capital for the region as a whole. Another context is provided by **Brian J. Aitken and Ann E. Harrison**. They find that foreign equity participation is positively correlated with plant productivity (the “own-plant” effect), but this relationship is only robust for small enterprises. They then test for spillovers from joint ventures to plants with no foreign investment. Foreign investment negatively affects the productivity of domestically owned plants. The net impact of foreign investment, taking into account these two offsetting effects, is quite small. The gains from foreign investment appear to be entirely captured by joint ventures. Another point of view was determined by **Tam Bang Vua, Ilan Noy** (2009), who concluded that empirical studies on foreign direct investment (FDI) and growth in developed countries have yielded conflicting results using cross-country regressions. They use sectoral data for a group of six country members of the OECD. Their results show that FDI has positive, or no statistically

discernible, effect on economic growth directly and through its interaction with labor. Moreover, they find the effects seem to be very different across countries and economic sectors.

3. Research Methodology

3.1 Test of normality

Before we create the model, we have tested the depended variable if it has normal spread. Below we have represented the results of the test.

Table no. 1 Tests of Normality in long- run

Tests of Normality						
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	Df	Sig.	Statistic	Df	Sig.
Real_Growth_GDP	.150	20	.200*	.916	20	.084

*. This is a lower bound of the true significance.

a. Lilliefors Significance Correction

Table no.2 Tests of Normality in short- run

Tests of Normality						
	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	Df	Sig.	Statistic	Df	Sig.
Real_Growth_GDP	.196	5	.200*	.915	5	.497

*. This is a lower bound of the true significance.

a. Lilliefors Significance Correction

According to normality test we calculate Kolmogorov-Smirnov and Shapiro-Wilk coefficient which values are higher than 0.05. Dependent variable, in this case economic growth is normal for long term and short-term period of time. Then in other part of study we used linear multiple regression model to calculate allocated impact of variables in economic growth.

3.2 Model Specification

In this study we used as independent variables the investment categories calculated in % of PBB, while as dependent variable the real economic growth calculated in % too.

Firstly, we studied the influence of each variable in economic growth and the correlation between them. The study is made in dy periods of time: long term period and short term period. The study results are explained in tables in the end of the document.

3.3. Hypothesis

This research is based on the following hypothesis which will be tested for above mentioned regression model.

Ho: Private Investment, Public Investment, FDI have not any effect on economic growth.

H1: Private Investment, Public Investment, FDI have effect on economic growth.

3.4 Empirical Results

To calculate the impact of the variables on the level of GDP was used time series data for the period 1997 – 2017. Relying on time series data was made regression analysis using SPSS-21 program. The test results are shown in the table below:

Table nr.3: Summary of multiple regression results

Variables (%GDP)	Coefficient β		Significance	
	Long Run	Short Run	Long Run	Short Run
Private_Investment	-.107	-0.004	.191	0.998
Public_Investment	.742	1.307	.045	0.697
FDI	-.671	0.030	.000	0.972

In the table we see that determinable coefficient $R^2 = 0.63$ calculated during short term period while $R^2 = 0.618$ during long term period. We concluded that in both periods the significative power is relatively high. When we use F test we see the importance of model. In short term period the results is not likeable because $p = 0.718 > 0.05$ so hipothesis (H_0) is proved. So independent variables have not any effect on dependent variables.

In long term period $p = 0.001 < 0.05$ which shows that independet variables explains the difference of dependet variables in model. This means that hypohthesis (H_0) is no longer true because hypohthesis of research (H_a) is proved. In conclusion during long-term period independent variables influences on dependent variables. In order to allocate which of independent variables are important according to dependet variables we have to calculate regresion coefficient by t test. From results we conclude that:

Public investments have positive impacts in Economic Growth while FDI has negative impact but is important for both variables only in long term period. In this period p value for public investment is $0.045 < 0.05$ while for FDI p value is $0.00 < 0.005$. While private investment has negative impact on economic growth but it is not important because p value = $0.191 > 0.05$. According to regression tables we can write the equation:

$$GDP = 7.127 + 0.742 \text{ Public Invest} - 0.671 \text{ FDI} + 1.10090$$

In this equation we write coefficient (B) only for independent variables, impact of which is important for dependent variables.

Summary and Conclusions

Public investment has a positive impact on GDP, which effect is significant. In addition, the outcomes also show that public investment has crowding- out effect on net private investment so it results on a higher private domestic investment. The effect of foreign investment is negativ and significant also.

Impact of independent variables on dependent ones is shown in graphical and econometric analysis. According to graphical analysis we prove that it exists a positive correlation between IHD and gross inside product. The reason why empiric result does not give the expectance result, might be correlation between independent variables which are part of this analysis. We want to emphasize that regardless the results of the study, IHD has positive impact in economy of a country because employment and incomes are increased. Finally based on result of our study we conclude that public investments improve economic situation of a country. We will have a stable economy if a lot of investments are made in a country.

Finally we suggest:

- Government should make more efforts to develop national human capital to attract and serve for FDI inflows. Moreover, the openness of the economy and the foreign exchange environment shall continue moving in favourable track.
- Powerful encouragement of initiatives dhe investments in economic sectors which provide huge regional economic growth. So government should be focused on branches of economy that develop regional trade. In Albania our priority should be focused on stimulation of agriculture production and their export outside country, handicrafts, tourism and tradional products.
- The impact of public investment on growth depends significantly on the quality of governance.
- If we have more and more collaborations between foreign and local companies, we will have an increased quantity of productions in our country and this results on positive economic growth.

Abstract: The management of each school unit is the greatest challenge that a school principal is called to face, as soon as he is required to combine leadership skills, broad skills, efficiency, ingenuity in dealing with crises that arise daily within a school community, in parallel with and combined with the culture that he is called to shape but also, to be a role model, both for his colleagues and for his students, as the main person in charge, of this picture of society. Thus, the purpose of this study is to determine whether the mental resilience and complex psycho-emotional skills possessed by a school principal, help him to adequately cope with the duties and responsibilities defined by his role.

The study focuses on primary school principals, this means to kindergartens and primary schools that are the core of compulsory education in Greece, having the largest number of students per school unit, and therefore their management seems to be particularly demanding. The sub-objectives of this study are to highlight the skills and weaknesses that the managers face during the carrying out of their duties, their roles and responsibilities, as well as the tools they use to perform their work effectively. The sample of the study will be the principals of formal and special education units of a specific region in Greece, while the analyzes will be obtained through the respective questionnaires and the relevant reports of the participating principals. The results of the present study can be used for further investigation of the mental reserves and the mental involvement of teachers - principals.

Keywords: leadership skills, mental resilience, primary education, principals, demanding role

1. Introduction

Achieving having a school capable of meeting modern real needs and requirements, presupposes a high quality educational environment. The main actors of this quality approach are all teachers and especially school principals and especially higher authorities, who are called to meet the multidimensional needs of the modern school. The acquisition of basic skills, such as leadership, management, psychoanalysis, etc., presupposes the existence of training programs that are addressed to executives of education and take into account the needs presented in this field. Upgrading the professional development programs of teachers and educators, is a key factor in providing better educational processes, introducing reforms and necessary educational policies.

The concept of school effectiveness in recent decades is referred to, as a counterweight to the view of school as a mechanism of reproduction, of educational and social inequalities and its theoretical background, emphasizes the active role of school in improving the level of students (Pasiyas, 2017). According to Edmond (1979), founder of the effective school movement, research in schools in poor areas of the United States, has concluded that all children are educable and that school behavior is critical to the quality of education provided, which presupposes that the public fair school teaches poor students as well as students of the middle and upper social strata.

Clearly the criteria for defining effectiveness, include political and social choices, but a school is effective when it has quality education and equal learning opportunities for all, but also when the staff involved are actively and energetically involved with vigor and will, guided by democratic and decisive leadership (Lezotte, 1989). Through this position, the importance of the management and its executives is emphasized once again, and especially in primary education, where the foundations of school attendance and the educational pedagogical process are laid.

A major element for the school community is the mental resilience of its members. In the complex and multidimensional educational work, it is considered necessary and imperative to have many different abilities and skills, with the predominant one being mental resilience, since teachers are called upon to face daily multiple challenges that require huge mental reserves. A prerequisite for a person to be considered mentally resilient is whether they are better adapted than expected, based on the data of the conditions they experience (Wright & Masten, 2015).

Psychological adequacy is a key criterion for mental resilience and refers to the effective adaptation of the individual to his environment, which is inferred from the way he has faced in the past or continues to face as defined within the specific cultural and historical context in which he lives. The indicators of a manager's psychological competence, for example, are the quality of relationships with his colleagues, work performance, self-esteem, positive emotional mood, the absence of dysfunctional behaviors, etc. The personal competence characteristics of adults generally refer to extroversion, to self-control, to positive self-perception, to the sense of self-effectiveness, to self-esteem, to the positive assessment of events, to optimism, to the regulation of emotions, to the active management of difficulties, in humor, etc. (Herrmanetal., 2011; Hornor, 2016).

2. Mental Resilience: A Holistic Approach

2.1 Mental Resilience - Conceptual References

The term "resilience" in the field of social sciences defines the adaptive ability of the individual to respond positively and successfully to the needs and requirements of the environment and despite obstacles, dangers or threats, to recover after traumatic events (Bonnano, 2017). In Psychology the term is used to describe the ability to recover from negative emotional experiences and the flexibility to adapt to the required changes from a stressful event (Lazarus, 1993). It also refers to the individual's resistance to adversity or recovery from stressful situations and his empowerment in future similar situations (Rutter, 2006, 2012).

AnnMasten (2001) refers to mental resilience as the ability of an individual to manage challenges and difficulties in all situations and areas of life and to return without collapsing after adversity, emphasizing that resilience is based on fundamental systems of human functioning and survival, and represents an adaptive mechanism of the individual to deal with stressors and difficulties.

George Bonnano (2004) focused on traumatic events, defining mental resilience as "the stable trajectory of a person's healthy functioning after a particularly adverse event" and that successful adaptation depends not so much on any regulatory process but on ability to flexibly reinforce or suppress emotional expression according to the requirements of the situation.

Rachel Yehuda (2007) presented Mental Resilience as the opposite of psychopathology or post-traumatic stress disorder and focused on the biological changes that take place to adapt to the environment as well as a number of other available resources which the individual has (support system, opportunities, better DNA, etc.).

2.2 Aspects and Dimensions of Mental Endurance

Other scholars consider Mental Resilience to be an extension of the ability to manage stress and define it as a return to normal mental state and healthy functioning. Others also focus on results that may be different in each individual, due to the diversity of human reactions based on their individual differences. It can be positive for resilient individuals, while the opposite is true for vulnerable individuals and in some cases negative prior experience or experienced adversity leads to individual empowerment and stronger resistance to future stress (Rutter, 2006).

In this context, we are talking about personal resilience and protective sources refer to personality traits of the individual such as: a) the "sense of dominance" which includes optimism, self-efficacy and adaptability, b) the sense of kinship, i.e. the emphasis that is given to close interpersonal relationships and access to support from people with whom a bond of trust has been developed; c) "emotional reactivity" refers to the individual's rapid response to negative emotional stimuli; d) the meaning of life derived from spirituality; and the positive expectation in the future (Schneider, 2018).

According to Wright & Masten (2015), *"in modern dynamic, open systems, the behavior of the individual system is influenced by many interactions of each system with the others."* Human adaptation depends on the interaction of many systems in which the individual lives and operates and so Mental Resilience must be seen as the result of this interaction of the individual within the biological, psychological, sociological and cultural system that develops and interacts.

The basic dimensions of Mental Resilience emerge from its very definition, as expressed in many variations of the various theories. The first refers to the adversities in which the person is forced to live, the second refers to the protective factors and processes that help the mentally resilient person to avoid the negative effects of risk factors and the third dimension to the fact that, despite the adversities, the individual is well-adjusted and psychologically adequate (Rutter, 1993).

Bonanno, Romero, & Klein (2015) argue that we should treat the concept of Mental Resilience as an extended concept and as an "umbrella" phenomenon, which includes a large number of elements, which are temporally related and cannot be understood individually. A relatively simple model they suggest includes:

- The basic degree of adaptability before adversity, from which the reaction mode and results are derived.
- The facts and the actual conditions of adversity.
- The results and the reaction after adversity, which refer to both the basic adaptation and the conditions of adversity.
- Measuring the prediction of resilience outcomes before during and after adversity.

2.3 The Protective Factors of Mental Resilience

Factors that mitigate or modify the effects of risk factors in a positive direction to achieve positive results are called protective factors (Truffino, 2010). The categories of factors that can theoretically act as protectors for the psychological adequacy and mental health of people experiencing adverse conditions and stressful situations include personal factors (temperament, intelligence, cognitive abilities, individual resilience, etc.), quality relationships with family and connections with people in the wider environment (safe neighborhood, quality school, leisure activities), social support and interpersonal relationships (participation in clubs, friendships, social networks, etc.), the protective function of religion, as well as the creation of "meaning in life" through a value system (Garmezy, 1993; Masten, 2005; Luthar, 2006; Masten, 2012; Mansfield, Beltman, & Price, 2014; Ungar, 2014; Bonanno, Romero, & Klein, 2015; Siepel et al., 2015; Schneider, 2018).

The enhancement of the above factors helps primarily in the healthy development of the individual, in self-efficacy, in self-regulation, but also in the dynamic treatment of conjuncturely demanding life situations. Also, all of the above factors (whether they are positive, so they act as protective factors, or are negative and act as risk factors) are not static. Instead, they are fluid and change over time or as situations change.

2.4 The Basic Models of Mental Endurance

In the most commonly required models of Mental Endurance, we find the following:

- The Compensatory Model, which treats resilience as a factor that neutralizes risk exposure. In the study of Werner & Smith (2001), four main characteristics of the person with mental resilience are mentioned: a) active attitude in problem solving, b) tendency to positively deal with experiences even

if they are negative, c) ability to gain positive attention of other people and d) strong faith and confidence in the positive side of life (Ledesma, 2014).

- The Challenge Model, according to which risk factors can actually extend an individual's ability to adapt. Negative experiences, that is, essentially prepare the person for possible adversity and possible difficult situations that the person will have to face in the future. (McEwen, Gray & Nasca, 2015).
- The Immunity to Vulnerability Model, according to which there is an interaction between protective factors and risk factors that reduce the negative effects or mitigate the effect of exposure to risk. This model of resilience suggests that protective factors help the individual's positive reactions and the development of healthy personal characteristics despite adverse conditions, experiences and situations. Protective factors also include emotional skills, intrapersonal reaction skills, academic and work skills, self-esteem, life skills, planning and problem solving (Ungar, 2004).

3. Mental Resilience in Educational Administration

3.1 Introductory Report

Although the majority of studies on Mental Resilience were initially focused on children and young people (Bonanno, 2004), it has been shown that this ability works widely and is applied in the workplace, either as a characteristic of the individual coping with difficulties or as a recovery process of the individual or organization from adversity, either as a result of experience and learning about future stressful situations, and is related to employee performance and effectiveness, regardless of employment (Harvey, 2006; Yousef & Luthans, 2007).

This approach has been used by the scholars of the Educational Administration to identify and describe the dimensions of Mental Resilience in the school environment, as well as in the way that the Principals of the School manage, in practice, to face and overcome the difficulties in their professional everyday life (Isaac, 2003). The responsibilities of the modern principal include, not only the bureaucratic work required by his administrative position or the provision of instructions and directions for the implementation of the curricula but also the ensuring the smooth operation of the school in a healthy, safe and learning-friendly environment (Leonard & Sparkman, 2012). Each school principal applies his / her own system of values, management style, behavior, set of abilities and skills, personal characteristics, etc., which he / she transfers (consciously or unconsciously) and influences (positively or negatively) the cultural context in his / her workplace, as well as and the behavior and reactions of all members of the school community (Maulding, 2012).

The nature of their work and the school environment requires the principal to persevere and make a firm commitment to cope with stressful difficulties in the exercise of his multifaceted role, so he must be equipped with a range of skills, not just recovery from stressful situations. but also, with the so-called ability of the everyday (Kelchtermans, 2011). It is essential for the principal to be involved daily and to resolve situations and problems involving many stakeholders, so that his / her personal practices in implementing communication policies, problem solving, change, motivation for development and promotion of educational work, participation in social and cultural events of the local and wider community, directly and indirectly affect the balance of daily life at school and dictate the existence of mental resilience, determination, hope, optimism and commitment, which must be supported by a strong core of values (Day, 2014).

3.2 The Principal at the Primary School

The position of the director of a school unit is at the lower level of the administrative hierarchical pyramid, but his role is extremely important in its organization, administration and operation. According to the official legislation, the day-to-day administration of the school unit is exercised by: the principal, the deputy principal, the teachers' association. The principal is the hierarchical body of the staff that serves in the school unit, is selected after a special procedure and is placed organically in school units.

The role of the school principal includes the implementation of laws, presidential decrees, ministerial decisions, circulars, etc., manages the liaison with the hierarchical higher levels of the educational administration, promotes educational innovations and ensures that every measure is taken. which

contributes to the proper functioning of the school. In order to achieve good and effective management, the manager is required to have management knowledge (management) and a multifaceted and continuous scientific training in issues such as planning, organization, consulting, evaluation, motivation, efficiency, the achievement of goals, the administration and management of the human resources of each school unit (Mardas&Balkanos, 2002).

3.3 Responsibilities and Skills of Managers

The current social data that seeks a flexible and competitive school requires the principal-leader to have specific knowledge and skills, in order to promote the goals and values of the organization and to shape its directions accordingly (Morgan, 1996: 32-37;Kantas, 1998). Within the dominant aspects of a manager's leadership role, we find the creation of a vision, the motivation of the staff, the management of the team, and the creation of the appropriate climate (Iordanidis, 2005).

The basic functions of a manager within a formal organization such as the school unit, are concentrated in maintaining communication through an organizational structure and in the harmonious "informal organization" of managers, in providing the necessary services of individuals to the organization, but and in the formulation and definition of objectives (Andreou & Papakonstantinou, 1994). Therefore, the management of the school unit is called upon to fulfill the following administrative activities: Motivation-motivation of teachers, Conflict management, Ensuring communication, Creating a culture and favorable climate, Caring for the professional development of teachers (Hatzipanagiotou, 2003).

One of the most important characteristics of an effective principal is his ability to be visible everywhere in the school, to be a living role model and point of reference for his subordinates. He is also called to be able to focus on emotional intelligence and the possession of five emotional and social abilities consisting of self-awareness, self-regulation, behavioral motivation, awareness and social skills (Andreou, 1994; Pasiardis, 2004). The principal is therefore called upon, on the one hand, to promote the success of both general objectives set by the state and the educational authorities, as well as specific objectives which fall within his jurisdiction, to set them, taking into account the requirements and perceptions of the teachers and the needs of students, utilizing the human and material resources available to ensure their success (Kotsikis, 1993).

The role of the principal, as it is formed today, contains a contradiction: the principal, on the one hand, deals with administrative and bureaucratic issues concerning the day-to-day operation of the school as an executive body of power, and on the other hand a modern, collaborative and effective school that is in constant interaction with society. It must, therefore, transcend the perception of the principal-manager of the bureaucratic model of administration, manage in a functional way the needs of the members of the school community and discover the common place of the vision and the goals of the school with their achievement factors (teachers, students, parents) (Georgiadou &Kambouridis, 2005).

The school principal is primarily responsible for the smooth running of the school, the coordination of school life, the observance of laws, circulars and official orders and the implementation of the decisions of the teachers' association, issued in accordance with the ministerial decision on responsibilities of the teachers' association. He also participates in the evaluation of the work of the school teachers and collaborates with the school counselors”(Lilimbaki, 2013).

3.4 Profiles and Skills of Primary School Principals

Today's principals are called upon to balance their dual and contradictory and, at the same time, executive role, that of bureaucrat-executor, but also of a leader and visionary in a conservative, suffocating, centralized operating framework of the school unit that survives even today. Weaknesses are identified around stereotypes about their role, i.e., in influencing teachers, in the functional management of the needs of school community members, as well as in finding a point of intersection with the achievement factors of the school context (Koutouzis, 2016).

In addition, their professional profile includes another dual role, one which must meet the expectations of the colleagues of the team he leads and one which must obey the orders of his

hierarchical superiors since he is an appointed civil servant (Athanasoula-Reppa, 2008). The variety of roles and tasks of the Principal involves the common acceptance of having a range of skills, which allow him to manage process, envision, inspire, in order to operate the school unit effectively (Stavrou, 2018).

The modern school does not need a principal-bureaucrat who is devoted only to the processing of official correspondence and the organization of the smooth functioning of school life, but a principal-leader who can create a vision so that the school unit acquires its own culture, its own identity and at the same time, to inspire and give life to all the functions of the school, as successfully emphasized by the Panhellenic Scientific Association of Primary Education Directors. After all, school management is the ongoing and dynamic process of planning, organizing, directing, and controlling all the productive resources involved in the educational effort so that decisions, actions, and knowledge products are effective (Petridou, 2002).

The manager, although at the lowest level of the administrative organization of education, must have skills that allow him to exercise leadership behavior based on specific roles and functions, so that he is not limited only to management or instruction, but also to development organizational resources, organizational, design, and control in parallel (Burandas, 2005). The school management must identify the needs of staff, use their skills through collaborative efforts and not through requirements, and adjust the leadership style accordingly with the situations. To be able to fulfill his duties, he must have a wide range of knowledge and skills to facilitate the development of rules, values, beliefs and assumptions, focusing on student progress, teacher professional development and support, and constructive communication; collaboration with parents building a positive school climate (Karapanagiotou, 2015).

The skills that the school principal must have in order to be effective in his / her work are: a) The ability to plan the objectives and goals of the school, as well as the ways and means to achieve them, b) The ability to organize the appropriate framework to properly activate the human resources for the efficient operation of the training unit, c) The ability of the management-management of human resources, d) The ability to control whether the results are in line with the purposes of programming , in order to redefine and organize the appropriate framework that will lead to the achievement of the desired result (Saitis, 2002).

Control, therefore, is not aimed at staff behavior but at feedback, review and planning of the next strategic objectives. It is argued that in the educational unit the administration is effective, when the expectations of the principal-leader, the teachers' association and the project converge, while with a more macroscopic look the principal simply tries to reconcile, shape and implement the "external" educational policy, which emanates from the central power shaping. an internal educational policy in the school unit in which he is in charge and creating an environment of continuous improvement and modernization of the organization in which he leads (Zavlanos, 2003).

3.5 The Value of Training for the Execution of the Managerial Project

A dominant element in the operation of the school as an organization, is the principal, who in order to respond effectively, is necessary to have scientific knowledge, skills and experience, communication skills, and to pursue his professional development with continuous and multifaceted training (Georgiou, 2005). Their frequent inability to perform their duties effectively is explained, among other things, by the lack of basic training and education in administrative matters, since according to the relevant surveys, 88-90% of managers do not even have the basic training in educational administration matters. A key reason for this lack is the way they are selected, where their academic knowledge is devalued, their specialization in organization and management is not taken into account, while their years of service are overemphasized (Daraki, 2007).

Despite the tendency in the evaluation of their qualifications, groups of education executives, knowing their weakness in the field of training, have underlined the need to organize training programs by formulating specific proposals for the character, content and appropriateness of training institutions (Kostika, 2004).

From the above it can be seen that the practice of teaching is becoming more and more the result of negotiations through which the skills of teachers are developed and mobilized by interactions with

the educational community, the institutions and the contexts in which they fall. The focus on teacher skills can be seen as a consequence of the European shift to core competencies in school curricula, and the success of teacher skills policy requires significant behavioral changes in key teachers and providers of education, teachers and their professional development. After all, it constantly seems that schools are becoming more and more complex and autonomous organizations and various skills are required for the effectiveness of their management (Engestrom, 1999; Caena, 2013).

4. Research Results - Conclusions

Taking into account the data of the literature review, an attempt was made to quantify the mental resilience of principals through the use of a questionnaire specifically addressed to teachers. The aim of the quantitative research is to investigate the existence or non-mental resilience among primary education executives and to check the existence of a correlation with demographic and service characteristics. The research involved 139 primary education principals in the majority, who were asked to answer weighted with the Multidimensional Scale of Teachers' Mental Resilience. This scale includes 26 statements and evaluates four dimensions of teachers' mental resilience: a) Professional Mental Resilience, b) Emotional Mental Resilience, c) Social Mental Resilience and d) Motivation and was selected as the most complete and multidimensional study. A weighted closed-ended questionnaire with questions on a Likert scale was used to measure the mental resilience of the sample principals, namely the Multidimensional Teacher Mental Resilience Scale (Mansfield & Wosnitza, 2015). The questionnaire was distributed electronically to Primary School Principals of the Thessaly region.

Regarding gender, men's responses were higher with a positive sign, but it should be noted that men are more than women in this sample of teachers and perhaps this unequal distribution affected the results. In addition, perhaps the fact that women are in charge of many roles makes them less resilient to mental reserves. Regarding the age, the findings are in line with the data in the literature where they show that the teaching profession is particularly stressful and especially for young people, who have the highest rate of leaving the profession. Regarding the total years of service in education, they play a positive role in shaping mental resilience. Regarding the type of marital status, it is observed that married educators presented more positive answers, which shows that marriage maintains balance and therefore increases mental resilience.

Regarding the higher level of education of the sample teachers, the principals with a postgraduate degree accumulated higher percentages in positive responses for mental reserves. Regarding the type of primary education served by the sample principals, the majority serves in Primary special education and therefore no safe conclusions can be drawn due to the unequal distribution. Most primary school teachers responded positively to the question of whether they are good at building relationships in a new post of job.

In general, the sample managers have all four components of mental resilience to a satisfactory degree. Regarding its influence on the work of executives, the majority of respondents have characteristics that enhance the leadership ability of Managers, such as flexibility and adaptability, organization, balance of managerial role, perseverance, enthusiasm and motivation, good control, challenges, communication and perception of situations from different perspectives are some of the characteristics that affect the administrative work of the respondents.

The challenges of our time are great and require a capable and flexible school that meets the requirements of today's reality, so that it manages to adapt to the continuous developments that take place both at European and international level, facing the new knowledge creatively and critically.

The work of education executives acquires major importance, as it involves the development of policies and actions aimed at shaping a dynamic and effective education management system to meet the challenges and needs of the time. Although teaching can be stressful, especially for young teachers, teachers' mental resilience is a relatively recent area of research. Regarding the resilience of teachers, there is little research in the literature. This gap is attempted to be filled by the present study through a concise but complete research report and development, which took place in the Region of Thessaly, in the field of the aspects of mental resilience experienced by the managers of educational units.

Regarding gender, men's responses were higher with a positive sign, but it should be noted that men are more than women in this sample of teachers and perhaps this unequal distribution affected the results. In addition, perhaps the fact that women are in charge of many roles makes them less resilient to mental reserves. Regarding the age, the findings are in line with the data in the literature where they show that the teaching profession is particularly stressful and especially for young people, who have the highest rate of leaving the profession. Regarding the total years of service in education, they play a positive role in shaping mental resilience.

Regarding the type of marital status, it is observed that married educators presented more positive answers, which shows that marriage maintains balance and therefore increases mental resilience. Regarding the higher level of education of the sample teachers, the principals with a postgraduate degree accumulated higher percentages in positive responses for mental reserves. Regarding the type of primary education served by the sample principals, the majority serve in Primary special education and therefore no safe conclusions can be drawn due to the unequal distribution.

Most primary school teachers responded positively to the question of whether they are good at building relationships in a new job. Of course, it is worth noting that all special education schools in the Region of Thessaly are 16 in number, so the distribution with general education schools is unequal anyway.

In a broader sense, the component with the highest average value is social mental resilience, while the component with the lowest score is emotional mental resilience. Therefore, we conclude that the sample managers have all four components of mental resilience to a satisfactory degree, so they can be considered as mentally resilient managers. About how mental resilience affects the management work of Managers The majority of respondents have characteristics that enhance the leadership ability of Managers, such as flexibility and adaptability, organization, balance of role as a Manager, perseverance, enthusiasm and , challenges, maintaining control, good communication and perception of situations from different perspectives are some of the characteristics that affect the administrative work of the respondents and in fact have a large percentage of the majority of Managers in the sample.

Thus, in terms of checking the correlation with the demographic and service characteristics of the sample, the prefecture does not seem to have influenced the answers, while on the contrary the school area, gender, age of teachers, total years of service in education, marital status, specialty, higher level of education and type of primary education influenced teachers' answers to statistically significant questions.

Good interpersonal relationships between colleagues have a positive effect on their psychology, so the role of mentor could play a catalytic role in this direction. Evidence that is confirmed by the literature research and verified by the field research. Its introduction in the school environment was proposed by the former Minister of Education and was voted by law in the Greek parliament, however, it has not been implemented so far for unspecified reasons. Equally useful tools could be programs or workshops aimed at Positive Psychology, mental empowerment and mental resilience of teachers. Holistically, it is concluded that principal educators based on the results of the present study have mental resilience. The results of the present study could be used to design special educational programs and interventions to strengthen the mental resilience of teachers and in particular the principals of primary schools.

Access of SMEs to Bank Loans During the Coronavirus Crisis: A Case of Slovakia

Katarína Belanová¹

¹ University of Economics in Bratislava, Slovakia, e – mail: katarina.belanova@euba.sk, ORCID: 0000-0003-2634-9238

Abstract: This paper surveys the impacts of the current economic recession caused by the COVID-19 pandemic. Due to the economic and social importance of the small and medium – sized enterprises for the economy of the Slovak Republic, it is necessary to improve the business environment for their development, esp. to improve their access to sources of finance. As we present, SMEs in Slovakia are primarily financed from their own sources, respectively from loans and leasing. Compared to large businesses, they are supposed to be more vulnerable, riskier, and so it is more difficult to obtain external sources of finance for them. The aim of the article is to evaluate the access to bank loans of SMEs in the Slovak Republic at the times of the coronavirus crisis. We found that the dynamics of credit growth maintained stable from the point of view of the corporate sector as a whole, but the availability of financing was limited for riskier groups of companies.

Keywords: Small and medium – sized enterprises, loans, banks, coronavirus crisis

1. INTRODUCTION

Small and medium-sized enterprises (SMEs) are the most important segment in the business environment of almost every economically developed country. They bring innovative products to the market, represent an important source of economic growth and they are of great importance in job creation.

According to the Report on the State of SMEs prepared by the Slovak Business Agency (2020), SMEs accounted for 99.9% of the total number of business entities in the Slovak economy in 2019. SMEs accounted for 73.8% of employment in the corporate economy and contributed by more than half (54.9%) to total value added.

One of the basic prerequisites for the development of the SME sector is access to finance. Small and medium-sized enterprises, given their distinctive features, have different financial needs compared to large enterprises.

These businesses require different spectrum of financial tools in various stages of life – cycle. They often depend on the informal sources of finance at the initial stages of their life. External sources are getting to be important with the beginning of the expansion stage and access to them can influence the development trajectory significantly.

Current economic recession caused by the COVID-19 pandemic has a greater impact on the business sector than the crisis of 2008. Many companies have had to reduce or even to close their business completely as a result of various measures taken to prevent the spread of the disease. Insufficient demand, low liquidity and significant fixed costs represent a serious deterioration of the financial situation for many companies. However, the crisis has affected the most vulnerable segment of the business sector, SMEs, to the greatest degree.

Many small and medium-sized enterprises are currently struggling with a lack of liquidity, which results in subsequent insolvency.

As the impact of the prevailing pandemic is also felt in the financial sector, many commercial banks are much more cautious in lending - some of them have responded by tightening of credit standards, making it much more difficult for businesses to access credit financing.

The aim of the article is to evaluate the access to bank loans of SMEs in the Slovak Republic at the times of the coronavirus crisis.

2. THEORETICAL BACKGROUND

The differences in SME finance compared to financing of large, established companies, has always been in the interest of many studies.

Berry, Grant, and Jarvis (2015) dedicated their attention to issues of obtaining funds and attitudes of banks to small and medium-sized enterprises. They have proved that banks play a crucial role in financing of SMEs because they have a difficult access to the capital market.

Additionally, according to Dierkes, Erner, Langer and Norden (2013), SMEs are not the attractive client for bank lenders. Machauer and Weber (2000) dealt with credit relationship of SMEs. Degryse and van Cayseele (2000) surveyed the relationship between interest rates and loan amount. Prevan and Kuvek (2014) argued, that smaller and younger companies have bigger problems with external financing and also pay higher prices. As table 1 reveals, this holds also in case of Slovak SMEs. Larger enterprises have more possibilities for financing as SMEs.

Table 1: Possibilities to financing according to corporate size (%)

enterprise	micro	small	middle	large
Share of own funds in total assets	40.6	38.7	40.7	43.5
Bank loans	19.3	26.5	25.2	19.9
Bonds issued	2.4	4.5	1.2	1.3
Liabilities to related entities	4.5	9.1	20.6	18.8
Obligations from commercial contracts	14.5	25.3	29.4	34.0
Other liability items	59.3	34.6	23.6	26.0

Source: Own processing according to the data of the National bank of Slovakia

As OECD (2016) states, bank lending is the most common source of external finance for many SMEs and entrepreneurs, which are often heavily addicted to straight debt to fulfil their start-up, cash flow and investment needs. SMEs, however, typically find themselves at a disadvantage with respect to large firms in accessing debt finance. It is connected with their smaller size, lower degree of diversification, more limited market and higher riskiness. As Covaci (2008) presents, SMEs are in generally riskier than large companies, because they present a high sensitivity to economic shocks while disposing of an inferior capacity to absorb variations. This makes it more difficult for SMEs to borrow than for larger companies, and may make it effectively impossible for many SMEs to borrow money at all. From this reason, SMEs rely on internal or "personal" funds, increasingly suffer from information asymmetry problems and have a small internal rate of return.

In Slovakia, SMEs are primarily financed from their own sources, respectively from loans and leasing. These are the sources that they know and therefore they most often use them (Belanová, 2015). We can document this by the data released from the National bank of Slovakia as well (table 2).

Table 2: Financing of Slovak enterprises, in EUR mm

	2018	2017	2016
Bonds and loans totally	46,728,237	48,682,377	42,280,213
Bonds issued:	5,122,764	5,734,102	5,857,755
-in Slovakia	1,495,486	1,495,445	1,418,270
-abroad	3,627,279	4,238,658	4,439,484

Loans from Slovak subjects	26,921,782	26,696,037	24,371,925
-enterprises	4,587,376	5,519,557	4,610,230
-banks	18,532,679	17,626,161	16,513,978
-financial leasing	1,952,014	1,896,457	1,848,690
-factoring	1,849,713	1,653,862	1,399,028
Loans from foreign country	14,683,691	16,252,238	13,050,533

Source: Own processing according to the data of the National bank of Slovakia

If we take into account the life - cycle of the company, SMEs are not very indebted at the beginning of their establishment. They prefer the use of own sources of financing, the share of which in total assets was about 81% to 85% in the first year. As for loan financing, we see that only about 3% of companies use this form. A short credit history of the company, as well as insufficient security of new business entities can be marked as the reasons. In 2019, the share of companies, which used a loan was 3.22%, which represents an increase by 0.15 percentage points compared to 2018 (table 3).

Table 3: Indebtedness indicators of newly created SMEs (%)

	2017	2018	2019
total indebtedness	17,96%	15,92%	18,85%
Own sources	82,04%	84,08%	81,15%
Bank loan	3,16%	3,07%	3,22%

Source: Own processing according to the data of the Statistical Office of the Slovak Republic

3. IMPACT OF CORONAVIRUS CRISIS

Belas, Bartosa, Habanik, and Novak (2014) explained that conditions for SMEs have worsened because of the global financial crisis.

However, the current economic recession caused by the COVID-19 pandemic has had an even greater impact on the business sector. Within the corporate economy, it has mainly affected SMEs. The negative consequences of the pandemic for entrepreneurs are reflected on both the supply and demand side. The pandemic thus causes many companies not to use their capacity to the full, for several reasons:

- the measures taken to control the disease limit or completely prevent entrepreneurs from carrying out their business activities;
- staff must take care of children as a result of school closures;
- the staff is not in good health;
- supply chains are interrupted or limited, leading to a lack of inputs necessary for business.

Sectors of hotels, restaurants, services and retail were affected by lockdown and other quarantine measures the most. Many of them had completely suspended revenues, which was reflected in their cash flow.

As table 4 shows, according to the European Payment Report (Intrum Slovakia, 2020), the most common crisis measures for companies include cost reduction, caution in indebtedness and restrictions on the recruitment of new employees.

Table 4: The most common measures taken by companies during a pandemic (%)

measure	Slovakia	Europe
cost reduction	54	38

greater caution when borrowing	22	35
restriction on the recruitment of new staff	23	29
identification of endangered segments	18	29
ensuring faster collection of payments from clients	21	26

Source: Own processing according to European Payment Report, 2020

As the supply of manufactured products or services decreased, so did the demand for goods and services. It caused a significant reduction in corporate revenues. The growth of entrepreneurs' incomes is also affected by the fear and uncertainty of consumers, who, in addition to the disease itself, also fear a loss of income. They are radically reducing their consumption costs. The impact of the prevailing pandemic is also reflected in the financial sector. Low confidence in the market caused stocks to fall. Many commercial banks are now much more cautious in lending - some of them have responded by raising prices, making it much more difficult for businesses to access credit.

The results of the Survey on the Access to Finance of Enterprises (SAFE 2020) by ECB, where the companies were asked about the situation from April to September 2020, reveal that SMEs reported a sharp deterioration in the economic environment in 2020.

In Slovakia, bank loans were relevant for 41% of SMEs (and used by 13% of them), while credit lines were relevant for 50% (used by 29%). Leasing was relevant for 50% and equity for 1%. The financing was used by 28% of SMEs for fixed investments and by 44% for inventory and working capital. 19% of SMEs used it for developing new products or services and 11% for hiring and training employees, while 20% refinanced their obligations. On the other hand, SMEs used it more often for other purposes (probably including COVID-related expenses). Between April and September 2020, 28% of SMEs in Slovakia actually applied for a bank loan (EU: 35%). 3% did not apply because of fear of rejection (EU: 4%). Regarding credit lines, 34% of SMEs in Slovakia actually applied for them (EU: 31%). 5% did not apply because of fear of rejection (EU: 4%).

3. DEVELOPMENT OF THE BANK LOANS PROVIDED TO COMPANIES IN 2020

The year 2020 was specific in that the world was hit by a global pandemic. The first case of COVID – 19 was recorded in Slovakia at the beginning of March 2020. The pandemic is, among others, associated with a trend of growing corporate indebtedness. The growing debt in the corporate sector mainly compensates for significant shortfalls in revenues of the companies.

In accordance with the statistics of the National Bank of Slovakia, we present the volume of loans provided to enterprises - non - financial institutions in total and broken down into short - term (up to 1 year), long - term (1 - 5 years), long - term (over 5 years).

According to the data of the National bank of Slovakia which we processed, we observe that the dynamics of corporate loans recorded a stable development during the first wave of the pandemic, July brought even its acceleration (table 5).

Table 5: Year-on-year growth in corporate loans in 2020

month	Growth rate (%)
January	2.3
February	3.0
March	3.7
April	3.5
Mai	3.5

June	3.8
July	4.7
August	4.3
September	2.9
October	2.8
November	2.6
December	2.2

Source: Own processing according to the data of the National bank of Slovakia

Corporate loans recorded stable growth at 3.6% in the first half of 2020 during the duration of the pandemic measures. As mentioned, lending activity even accelerated in July, reaching 4.7%. This is the fastest growth in the region of the central and eastern part of the EU. The growth of loans was heavily affected by the significant economic downturn. Compared to the beginning of the year, the credit dynamics even increased in the period from March to June. In March and April, short-term loans in the form of drawdowns of approved credit lines increased significantly, which was reflected in an acceleration of lending activity from 3.0% in February to 3.7% in March. The second quarter was already stable, with month-on-month increases in this period at the level of the average of previous years.

The situation across economic sectors was relatively diverse, with several sectors experiencing a slowdown in credit flows. Developments in industry shaped credit growth significantly, which accounted for almost half of the growth. In addition to industry, loans also grew in the case of car sales, accommodation services and selected professional activities. In the context of economic sectors, July remained relatively diverse, although there was some improvement in some other sectors. Construction and professional activities thus joined the above-mentioned sectors with a recovery in credit growth.

Two trends can be observed among EU countries in the context of the development of the volume of corporate loans. The first is the gradual slowdown in credit growth in the countries of the Central and Eastern EU region. As a result, Slovakia has moved to the first place in the dynamics of corporate loans within these countries. The second trend is the development in several large western EU countries, where lending to the corporate sector has accelerated significantly against the background of strong fiscal stimulus.

In July 2020, lending activity increased thanks to the improving situation in the economy following the release of epidemiological measures. Since the onset of the crisis, several important economic sectors have seen significant declines in sales from March to May. The end of the first half of the year has already brought a relatively significant improvement in the situation in the development of corporate sales.

After the situation improved in the summer months, credit growth declined to 2.9% in September 2020.

However, growth rate in the volume of loans granted to non-financial corporations compared to previous periods of 2020 continued to grow in IV. quarter of 2020. The year-on-year growth rate was highest for long-term loans over 5 years with a year-on-year growth of 6.0%. As for the volume of short-term loans, we recorded a year-on-year growth of 1.1% compared to the same period last year. On the contrary, for long-term loans from 1 to 5 years, we recorded a year-on-year decline in the growth rate in IV. quarter of 2020 at the level of 4.5%.

If we look at the situation from the point of view of the euro area, the volume of loans to non-financial corporations in the euro area increased by 5.5% in December 2020 compared to the same period of the previous year, while in Slovakia we recorded growth of 2.2%. In the euro area, apart from two months, we were able to observe a year-on-year decline in short-term loans to non-financial corporations throughout 2020. The year-on-year decline in these loans was 7% in December 2020. On the contrary, the volume of short-term loans to non-financial corporations in Slovakia in December

2020 increased by 1.1% year on year. During the last two years, we have recorded a year-on-year growth in short-term loans in Slovakia each month.

Throughout 2020, we recorded year-on-year growth in long-term loans in the euro area from 1 to 5 years, while in Slovakia we have seen a year-on-year decline in the value of these loans since February 2020.

We have been observing continuous year-on-year growth in the euro area in the item of long-term loans from 1 to 5 years since May 2015, and in December 2020 the year-on-year growth was 15.8%. Year-on-year growth in loans increased significantly in March and April 2020, when the growth rate accelerated from 3.4% in February 2020 to 12.1% in April 2020. The year-on-year decline in the value of loans with a maturity of over 1 year to 5 years in Slovakia reached minimum value in June 2020, when it represented -8.7%.

Long-term loans over 5 years to non-financial corporations in the euro area grew by an average of 5.1% in 2020, with the dynamics increasing significantly in the months of March to May. Year-on-year growth in loans over 5 years to non-financial corporations in December 2020 was 6.8%. In Slovakia, long-term loans over 5 years to non-financial corporations grew at a relatively fast pace in 2020, with more significant growth in June to September. The highest growth was achieved in this category of loans in September, when year-on-year growth was 8.8%. Year-on-year growth in December 2020 for long-term loans to non-financial corporations was 6%.

Although almost no impact of the coronavirus crisis can be seen on the overall growth rates of corporate loans, the availability of financing has been limited for riskier groups of companies. In terms of business size, credit growth was driven mainly by large enterprises, a large proportion of which were state-owned enterprises. Lending activity in the case of small and medium-sized enterprises, which are a riskier group of enterprises, remained markedly subdued, with average growth exceeding 1%. However, it is important to note that the decline in lending to small and medium-sized enterprises took place even before the coronavirus crisis at the turn of 2019 and 2020.

In this regard, July has already brought a slight improvement in the case of growth in loans to small and medium-sized enterprises. Lending, especially to large state-owned enterprises, played an important role in maintaining credit growth. On the other hand, the flow of loans to privately owned enterprises has slowed markedly. The July improvement was only partial in this case, with credit growth for foreign-controlled enterprises rising from 5.5% to 8.3% between June and July, while credit growth remained subdued at 1% for privately owned enterprises.

At the beginning of the coronavirus crisis, banks increased the share of loans provided to their clients. The increase in uncertainty associated with the COVID-19 pandemic was reflected in a partial reduction in funding for both new clients and clients of other banks. While in 2019 the share of loans provided to clients outside the own loan portfolio reached almost 8%, in the first half of the year it was just over 5%. July has already brought a partial correction.

The figure 1 documents, the volume of the new loans is very volatile, but it did not decrease even in the first phase of coronavirus crisis.

Figure 1: Volume of new loans provided to companies in the Slovak Republic, in EUR mm

Source: Own processing according to the data of the National bank of Slovakia

Although the tightening of credit standards was reported by almost all banks, the restriction on the availability of financing concerned mainly riskier groups of clients.

The reduction in supply in the credit market in the second quarter of 2020 was reported by almost all banks, but without a significant impact on credit growth. Measures against the spread of the disease taken by both the domestic government and the governments of other countries were almost immediately reflected in the decline in sentiment and the perspective of individual economic sectors. The result was a quick reaction of individual banks in the form of tightening of credit standards. The tightening affected all credit conditions, but most of all the amount of credit and the required collateral, to a lesser extent the maturity of loans and covenants. Non-interest charges remained the least affected. The interest margin increased mainly for riskier loans.

Restrictions on the capital or liquidity requirements or the cost of resources of the bank were mentioned only to a small extent as factors influencing the tightening of credit standards. The banks cited the absence of state guarantee schemes as an important fact influencing the tightening of credit standards. Despite the tightening on the supply side, whether from the point of view of banks or individual credit conditions, mostly riskier groups of clients were affected. This corresponds to the development of the volume of loans, where the slowdown in credit growth occurred mainly in selected groups of companies.

Despite the slower and more complicated start-up of state aid, loans with a state guarantee accounted for 13% of all loans granted in the third quarter of 2020. On the positive side, loans also grew in several sectors more affected by the crisis.

It is not possible to observe the impact of the crisis associated with the COVID-19 pandemic on credit risk indicators. By taking advantage of the deferral option, many companies have gained additional time to deal with a temporarily deteriorating financial situation. Several trends have continued in the development of previous years. The volume of non-performing loans also remained at low levels. The volume of non-performing loans taken out by non-financial corporations amounted to approximately EUR 648.9 million at the end of 2020. The volume of non-performing loans is generally much lower than in the past, as it remained above one billion euros between May 2010 and April 2017. If we compare the situation with the Czech Republic, at the end of December 2020, the Central bank registered non-performing loans in the amount of about 2.5 billion euros.

At the end of September 2020, the deferral of repayments was approved for 12% of corporate loans. Thanks to the possibility of deferring repayments, the share of non-performing loans has not increased yet, but banks will face an increase in non-performing loans in the coming period.

As table 6 reveals, the possibility of deferral of repayment was used to a greater extent by micro-enterprises and small enterprises and sectors significantly affected by the coronavirus crisis. However, this lower level is due to the fact that the legally defined deferral of installments does not apply to large companies that have agreed on deferral of installments individually with the financing bank. From the point of view of individual economic sectors, companies from the economic sectors most affected by the crisis made the most of the possibility of postponing installments. In the case of accommodation and food services, deferred loans account for half of total loans, while in the arts, entertainment and recreation sector, these loans account for one third.

Table 6: Share of deferred loans according to the size of the enterprise (in %)

	micro	small	medium	large
Share of deferred loans	15.0	15.2	11.8	5.9
the share of loans granted to enterprises which have been granted a deferral of repayments on	17.7	19.5	21.0	13.1

at least one loan				
-------------------	--	--	--	--

Source: Own processing according to the data of the National bank of Slovakia, data to September 2019

The deferral of repayments was just one of the measures taken by the governments to mitigate the effects of the COVID-19 pandemic and restart their economies and international trade. In general, these are measures to support:

- liquidity of companies and households (deferrals of loan repayments we mentioned, provision of loans and guarantees from public sources, relief in the area of tax burden)
- solvency of companies (capital injections from public sources, temporary stronger protection of debtors to delay restructuring-bankruptcy proceedings)
- exports (short - term export credit insurance) a
- employment policies (compensation for companies with compulsory closure, contributions to compensate for the decline in sales, contributions to job retention).

Slovakia is no exception in the use of support tools. Measures that are considered to be most effective so far include deferrals of corporate and household loan repayments and measures to support job retention.

In this context, we emphasize that the uncoordinated termination of support instruments may endanger the gradual recovery of the corporate sector. The main target group of ongoing support measures should be, in particular, promising companies with a sustainable business model that need to bridge the temporary shortfall in sales.

In a period of growing uncertainty due to the second wave of the pandemic, maintaining access to finance for businesses will be crucial.

4. CONCLUSION

This paper surveyed the access of enterprises to bank loans. We can conclude that the dynamics of corporate loans recorded a stable development during the first wave of the pandemic. Compared to the countries of the region of the Central and Eastern part of the EU, the domestic banking sector achieved the most significant growth in August. Credit growth has slowed in most of these countries. The situation is the opposite in several large western EU countries, where there has been a significant acceleration in corporate lending, probably against the background of strong fiscal stimulus.

Demand from clients, especially for operating financing, continued in the market. Banks' credit conditions eased partially after the tightening in the first months of the coronavirus crisis.

In terms of maturity, loans with a maturity of over 5 years contributed to the year-on-year growth most significantly. However, these were not investment loans, which continued at a subdued pace. The slowdown in investment loans was largely offset by government-guaranteed loans.

The year-on-year growth in the volume of corporate loans was relatively significantly affected by deferred loan repayments. The impact of the pandemic on the credit risk of the corporate portfolio will thus become apparent only after the end of the deferral of repayments and support measures by the state.

At the end of the third quarter of 2020, growth in corporate loans slowed to 2.9% year on year. The slowdown occurred after a significant increase in the summer months, when corporate loans grew at a rate of 4.4%.

Despite the slowdown in lending activity in September, the availability of corporate finance can be assessed relatively favorably. Uncertainty about future developments in the corporate sector remains significant.

Modern Management in Healthcare System

Katrin Krahtova-Nasteva¹

¹University of agribusiness and rural development, Plovdiv, Bulgaria

Abstract: Healthcare is an integral part of socio-political and socio-economic life in a country. In the last decades, reforms in the healthcare system have been carried out in almost all countries of the world, aiming to better meet the medical and social needs of the population and increase "profitability". The restructuring of healthcare systems worldwide is aimed at strengthening and improving healthcare, ensuring equal access to comprehensive and adequate health care, oriented to the needs of every citizen. In the conditions of coronavirus pandemics the management challenges to healthcare system are bigger and problems need urgent and effective solutions. The present study proposes ideas aimed at health benefits, efficiency and effectiveness by providing high quality healthcare in a changing competitive environment of health services and modern healthcare challenges.

Key words: healthcare, management, system, human resources, quality.

Introduction

Healthcare is a system of bodies, institutions, organizationally separated structures and activities for strengthening, protection and restoration of health and treatment of diseases based on medical science and practice, traditions and specific socio-economic conditions in the country. New requirements are set for medical specialists, in accordance with the rights of the patient and respect for his/her personality and human dignity.

The current conditions and trends for the healthcare system are in the following directions:

- Introduction and development of market principles;
- Transformation of healthcare institutions into autonomous market entities;
- Constantly developing competition between the medical establishments;
- Increasing the requirements for the care of the patient;
- Rapid improvement of technologies.

Thus, the provision of quality and affordable medical care becomes a major priority of health system, which requires the search for adequate management actions and solutions to improve the quality of medical activities¹. Management is considered as integrating knowledge, people, resources, structures and processes into concerted action². Effective management requires constant monitoring and an adequate response to undesirable changes.

The effective management system in healthcare means to build in real conditions from the available resources (staff, material and technical means, infrastructure, finances, etc.) a fundamentally new system of hospital care, meeting the needs of citizens, in accordance with the capabilities of the country, but also measurable with the European health service. Current work in the conditions of the pandemic situation is without an analogue and a ready model of action, as invariably in the management of the medical activities chance and risk are present. The management activities with their requirements reflect on the structure of each medical unit and institution, on the levels of the organizational structure and the individual work in the health system. New challenges in healthcare necessitate the introduction of new methods in the practice of medical professionals, improving the quality of medical care, better division of labor and delegation of rights and responsibilities. This

creates a need for each manager to be able to manage change, to balance the needs of employees and the goals of the medical institution to prevent insecurity and disorder.

There is an increased drive for effective training of medical professionals, fueled by the intensity of local and international competition, and rapidly changing market conditions. The results of the work are directly dependent on the behavior and relationships of medical professionals in the work environment, their skills and experience, their ability to make decisions, their value systems and expectations, their civic behavior. Modern training forms and develops these qualities in accordance with the dynamic requirements of the environment.

The problems of motivation are not new to management science, but they acquire new, unexpectedly important dimensions in moments of crisis for management. In the Bulgarian practice few decades ago they were related to the need for a complete change of the management system according to the rules of the specific model of transition to a market economy in the conditions of economic crisis. Now, the problems are even sharper in the coronavirus pandemics³. This requires managers to rediscover and rethink the truths of motivation in classical concepts and in modern theoretical models and to seek to apply them in the management of organizational behavior. The training activities of medical specialists are related to the motivation and stimulation of medical specialists and the application of an adequate and realistic system for evaluation of the performance of work tasks.

The main purpose of a management program in that context is to provide through organizational methods, innovations and constant control⁴ an affordable, adequate, timely and quality healthcare, meeting the market of medical services and the modern achievements of medicine as a science of highly competent, responsible and ethical staff - medical professionals to take their place as worthy collaborators in carrying out the overall healing process.

According to that the tasks of a program for management in a medical unit could be formulated as follows:

- to develop approaches, mechanisms, tools for improving management methods;
- to develop an accurate system for assessing the quality of work of medical professionals;
- to optimize the doctor-nurse-patient relationship;
- to develop a system for fairer remuneration of health care specialists depending on their contribution to achieving the goals of the healthcare unit.

The expected results are connected to:

- continuous improvement of the quality of healthcare;
- efficiency in the implementation of healthcare;
- high culture of relationships.

Current paper presents some recommendations and solutions for developing effective management programs in healthcare units.

Management activities in healthcare units

A program for management of medical specialists is an important strategy and a basic tool for the management and development of healthcare. The management system covers all the activities that need to be carried out, the connections between them, their interaction with the environment and the way of functioning in order to achieve the goals of the unit. The management of medical professionals covers activities that can be considered as elements and as a series of processes between which there are complex causal relationships. The elements in the management system are

³ Dimitrov, I., Spasov, E. 2021. Public health management in the European union and Bulgaria. Health security challenges in the context of the COVID-19 crisis. Academic publishing house "Talent", University of agribusiness and rural development, Plovdiv.

⁴ Zahariev, E. 2015. Alternative Forms for Promotion and Dissemination of Good Management Practices. Journal of Economic Development, Environment and People, v. 4, n. 3, p. 17-25.

all activities that must be carried out: analysis and design of positions, human resource planning, selection, training and evaluation of staff, remuneration, motivation, ensuring safe and healthy working conditions, improvement of labor relations, etc.

- *Job analysis* includes a systematic study of the content, responsibilities and relationships of positions and the requirements for their performers.
- The *design of the positions* covers the activity of determining the content, functions and interrelations between the positions, which takes into account both the technological and economic requirements of the work and the individual needs of the contractors.
- The *planning* of medical specialists is an activity of determining the needs for human resources and formulating appropriate actions to meet them so as to achieve the goals of the unit.
- The *selection* of medical specialists covers the recruitment and evaluation of job candidates, on the basis of which the most suitable one is selected in view of the requirements of the position and the unit and the procedure for his/her appointment is carried out.
- The *training and development* of medical specialists covers the activities for improving the knowledge, skills and attitudes of employees in order to increase the level of their performance and to provide career development opportunities, taking into account the individual needs of employees and future needs of employees and the organization.
- The *evaluation* of medical specialists includes characterization of the level of employment of the employees according to the set standards and formulation of guidelines for improvement at this level.
- *Remuneration* is an activity of determining adequate and fair remuneration in the unit in accordance with certain criteria.
- *Ensuring safe and healthy working conditions* includes improving working conditions and protecting the health and working capacity of employees.
- The *improvement of labor relations* is an activity of maintaining labor peace in the healthcare unit and the formation of favorable relations.

When managing medical professionals, some basic causal relationships must be considered:

- The planning of the medical specialists determines the needs of the staff and formulates the actions for their satisfaction by developing plans and programs for the development of all elements of the management of the medical specialists in accordance with the goals and plans of the unit. In this sense, the planning of medical professionals is crucial for the content of all other activities.
- The analysis and design of the positions provides the initial data in determining the criteria for selection and evaluation of medical professionals, forms the information base for evaluation of positions and the pay system, determines part of the working and rest conditions. In this way, it emerges as a factor that influences the relationship and is an object of interest in the process of collective bargaining. The results of job design and analysis are a necessary component in the process of determining training and development needs.
- The selection of medical professionals can be seen as an entrance through which human resources are passed, which subsequently become the subject of relevant management interactions - evaluation, training and development, pay, use under certain working and rest conditions and under certain employment relationships.
- The training and development of medical professionals provides the desired changes in the knowledge, skills and attitudes of people in the organization. In order to achieve this goal, it is necessary to carry out in parallel and in mutual connection the other activities of the management of the medical specialists. In this regard, the possible influence of working conditions on the employment of employees must be taken into account. The motivation for training is related to the existing system of payment and the opportunities to increase the salary after improving the knowledge and skills of the people. The training and development of medical

professionals is an important factor in labor relations and is therefore often present as an object in the process of collective bargaining.

- The evaluation of medical specialists provides valuable information, both for the needs of training and development of human resources, and for the payment of their work and in accordance with the achieved results. The evaluation of medical specialists is a traditional element in labor relations as a basis for the formation of adequate and fair salaries and criteria for internal movement of medical specialists.
- Remuneration is also linked to all other elements of the management of medical professionals. The main criteria for forming the salary are the content of the position (presented in the process of designing and analyzing the positions and the peculiarities of working and rest conditions), the qualification of the contractor (result of the selection and training of staff) and the level of his/her performance (characterized during the periodic assessment of employees). In this sense, salary is a focus in which decisions are concentrated on all other elements of the management of medical professionals.
- The activity of ensuring safe and healthy working conditions can lead to changes in some of the components of the content of jobs (working environment, work and rest conditions, burdens and monotony of work tasks, etc.) and in this sense is related to the design and analysis of positions, the selection, training and evaluation of medical professionals. The state of working conditions is taken into account when determining a part of the salaries and at the same time is an important factor for improving the labor relations in the organization.
- On the other hand, the regulation of these relations often turns out to be the starting point from which the activities for the improvement of the working conditions, the system for evaluation of the medical specialists and the remuneration of the work, the activity for training and development of the medical specialists start.

All these dependencies give grounds to conclude that the elements (activities) of the management of medical professionals function in close interrelation⁵. The omissions made in each of them affect the others.

The implementation of the activities characterizing the content of the management of the medical specialists can be considered as a process that covers several stages. The first of them is to diagnose the problem, to clarify the reasons that caused it, to determine those of them that are of leading importance. Based on this information, options are developed for its solution and the most effective one is chosen. After the implementation of the decision, the degree of its effectiveness is assessed.

In the broad sense of the term, the management of medical professionals is the management of people and is an element of the work of every head of a healthcare unit. Therefore, managers at all levels are actively involved in a number of management activities for health professionals. However, as the unit grows, so does the need to coordinate the activities of a larger number of human resources, which are distributed in more complex organizational structures. The responsibilities for the management of the medical specialists in the unit are also increasing. The requirements for application of modern highly effective methods and procedures in the management of medical specialists are increasing.

There is a need for a unified approach in solving the numerous problems that arise in this area. In connection with this, a specialized structural unit is created for the implementation of some of the activities of human resources management. This does not relieve managers of the responsibility to manage medical professionals in their units, but only provides them with professional advice and operational assistance when needed.

The main task of the *human resources department* is to ensure the most effective management and use of organizational human resources. Within this unit, the various activities discussed above, included in the human resources management system, are carried out.

⁵ Dimitrov, I., Fotev, P., Petrov, P. 2018. Interpersonal behavior, I, in the workplace. Contemporary Medical Science, Issue 1 (2018), 49-54.

The close interrelation of the management of medical specialists at micro and macro level is evidenced by the impact that the state of the national labor market has on the system through the relationship between labor supply and demand.

- provokes the unemployed to improve and change their professional skills in accordance with the real needs of the economy;
- stabilizes the relative workforce in the organization, helping to improve labor, production and technological discipline;
- has a favorable effect on the processes of integration in the organization;
- stabilizes and, under certain conditions, reduces the remuneration;
- facilitates the conduct of collective bargaining between employers and trade unions, etc.

When the demand for labor is greater than its supply, the labor market:

- provokes the growth of the labor remuneration for keeping the necessary labor force, as well as for attracting medical specialists;
- provokes the development of the internal labor market and in particular - the increase of the qualification, the retraining, the development of the personnel and their growth in the career;
- provokes the technical, technological and structural development of the organization in order to multiply the existing medical specialists, and this causes a significant change in the structure of the required workforce;
- tests the motivation of employees;
- provokes the demand for foreign labor;
- creates preconditions for increasing the movement of the labor force, etc.

The labor market also has an impact through its institutional structure:

- the more developed it is, the more effective the connection of the organization with the labor market and vice versa;
- the greater the protection of the national labor market, the less significant are the organization's links with the foreign labor market and vice versa;
- the more developed and efficient the infrastructure on the labor market, the more efficient the activity of managing the medical specialists in the unit can be, etc.

Guidelines for improving the management in healthcare system

Creating conditions for effective management by integrating the actions and coordinating the efforts of medical professionals:

- to be guided in a way that motivates the performance of the tasks;
- to clarify the activities of each participant in the treatment-diagnostic process;
- to build compliance between rights, obligations and responsibilities;
- to strengthen the responsibility of medical professionals in the process of providing medical care;
- to clearly state the obligations - the medical specialists to know what is expected of them;
- to specify the personal participation of everyone: to define the activities, to differentiate the perimeter of the functional obligations;
- all activities to be regulated in job descriptions;
- introduction of new and means for quality health care;
- regulation and control over the correct implementation of the tasks through dynamic monitoring and to make periodic evaluation of the performed activities in accordance with certain standards;

- making timely correction in case of deviation and new control;
- to create conditions for high morale and prevention of commercial pressure on the part of medical specialists and support staff;
- in all activities to respect and stimulate the autonomy of patients.

Creating a good psycho-climate and good relationships in the teams⁶:

- to allow autonomy in exercising control;
- to provide creative and supportive leadership;
- to encourage ideas, opinions and suggestions;
- to create a benevolent style of communication between the participants in the medical activities;
- to demonstrate respect, recognition and equality to medical professionals;
- to create and maintain an atmosphere of mutual trust;
- to encourage professional ethics, loyalty and confidentiality in the teams;
- to stimulate self-confidence;
- to provide optimal conditions for training and development of everyone; stimulation to increase the level of knowledge and skills of each medical specialist;
- systematic and patient in the introduction of new and newly graduated medical specialists in the teams - acquaintance with their competencies, responsibilities and obligations;
- to take into account the preference of medical professionals in relation to various aspects of their work.

The management should consider the construction and effective use of an accurate, high-quality and timely communication⁷ and information system for:

- adequate communication provision between the teams and the units;
- clarification and synchronization of requirements;
- well-organized hourly functional connections;
- adequate and effective communication between different levels of government⁸;
- effective information provision through the implementation of a unified computer network, uniting the automated workplaces for effective management of the registers and health files necessary for the medical practice;

- strict observance of the requirements of the health insurance fund for keeping the documentation;
- proper entry of all types of medical documentation;
- introduction and use of computer equipment and software in keeping medical documentation and document flow, management of the bed stock, issuance of medical documents, etc.;
- all documents should be kept in an appropriate version - computer or traditional;
- the registers and card files should be compatible with the other information carriers;
- to ensure security and inviolability for protection against unauthorized access, as well as reliable access and secure retrieval of data from the documentation.

Unlike the well-known practice in Bulgaria, in the selection of personnel to use mainly intelligence tests and various personality tests, the toolkit should contain some of the most modern methodologies for personnel selection, measuring the competence of the candidates. Among the questionnaires used are those that measure attitudes to work, abilities, motivation for achievement and the like. Based on the results of the applied tests to form three main indicators that serve as criteria for the future actions of the candidates.

The first indicator is the level of intelligence (IQ), which shows the potential of the person. The second indicator refers to the level of emotional intelligence (EQ), which shows the individual's suitability for teamwork and the degree of integration in the organization. The third indicator is the level of motivation (MQ) and is one of the most modern areas in recruitment. The methodology used is a combination of statements about what motivates the person and what demotivates him/her. Based on the level of motivation, it is possible to identify what needs to be done to achieve the goals. Standard interviews, traditional tests and verification of recommendations provide information on whether the candidate can do the job, while the results of the level of motivation can be a predictor of whether the candidate will do the job.

In addition to these already adapted and standardized questionnaires and tests, a methodology is being developed to measure the value orientations of the individual⁹. The methodology aims to differentiate relatively sustainable values - universal and specific to work, from those that are the result of economic and socio-cultural changes. Efforts are aimed at revealing the main dimensions of the values attributed to work - internal and external motivation in the performance of work tasks¹⁰.

The healthcare units are constantly striving to improve and keep up with global trends in this field. It is for these reasons that values are an important predictor for the rapid and successful adaptation of new medical professionals in the units.

Assessing the current socio-economic and political situation in Bulgaria, it can be said that the competitiveness and added value to the healthcare services is largely due to the human factor in it, which is really our strategic advantage over competitors. Extremely important in this regard are the demonstrated commitment and concrete actions of the management of the units to the training and development of its specialists.

- to create conditions for professional qualification and realization, taking into account the factors necessary for this: the development of medicine as a science, the creation of new

⁹ Dimitrov, I., Petrov, P., Irmov, V. 2018. Organizational development - model "Organizational cone". Proceedings of the International scientific and practical conference "Bulgaria of regions'2018": Socio-economic zoning: traditions, contemporary state and problems, 19-21 October 2018, University of agribusiness and rural development, Plovdiv, Bulgaria.

VII International scientific conference "Innovations in technology and education", March 2014. Ministry of Education and Science, Federal State budget institution of higher education "Kuzbass State Technical University named after T.F. Gorbachev", St. Cyril and St. Methodius University of Veliko Tarnovo, Bulgaria, Branch KuzSTU in Belovo, University of Agribusiness and Rural development - Plovdiv, Bulgaria, Belovo, March 2014, pp. 149-153.

technologies - equipment, medicines, introduction of new ethical principles, charity and humanism;

- to develop positive rules for training and development, as the goals are work-oriented, namely improving skills, increasing knowledge, acquiring specialized skills, increasing opportunities for growth;
- to encourage and motivate the training and professional development of medical professionals in accordance with modern requirements on a global scale for Continuing Medical Education (continuing education), i.e. the maintenance of high qualifications should be a permanent process. Guiding principles should be:
 - with regard to the patients - protection of the patient and society from incompetence
 - with regard to medical staff - to be a basis for better remuneration and the prospect of higher recognition of work performed;
- to build a mechanism for determining the need for training, including:
 - assessment of everyone's professional skills and knowledge
 - adequacy in the performance of professional duties;
- to create the necessary conditions and opportunities - development of programs and plans for postgraduate education and specializations:
 - specifying what training to provide and for whom to provide;
 - elaboration of a plan and selection of the trainees;
 - elaboration of programs together with the specialists, including the forms of training, the places of training, the schedule of the theoretical classes and the practical exercises;
 - conducting a colloquium and issuing a certificate for completed training course;
- to create and maintain favorable conditions for the proper training of students in the unit;
- to make maximum use of the knowledge and skills of medical specialists with a bachelor's degree.

Regarding the training of new medical specialists:

- to realize the integrity of the newly appointed medical specialist in the process of work;
- to get acquainted with the rules of internal order and other normative documents, including job descriptions;
- to be acquainted with the organization of work in the unit and the ways of communication with other units;
- to be acquainted with the competencies, obligations and responsibilities;
- to be acquainted with the main relations in the medical unit, research, treatment and recovery regime.

Regarding the training of newly graduated newly appointed medical specialists:

- to be aimed at the formation of quality and adequate activity, precise implementation of the set tasks, acquisition of professionally significant personal qualities, necessary in the future activity among the team;
- to acquire technical skills - fast, correct and skillful implementation of activities;
- proper behavior towards patients, doctors, other medical professionals and support staff;
- to form a sense of cooperation;
- to make a periodic assessment of the behavior of the medical specialist in the team, his/her adjustment, how he/she copes with the requirements and obligations, the degree of independence and adequacy, reactions in conflict situations and in situations with increased requirements.

Regarding the training of supporting staff:

- to carry out mandatory step-by-step training of supporting staff in order to acquire basic knowledge and acquire the correct technical skills to perform the activities within their competence;
- to prepare a project / programs and plans of those who will be trained;
- training courses to be conducted in small groups during non-working hours on the territory of the medical institution;
- to issue a certificate for completed training course.

With regard to the quality of medical activities, the medical activity in the healthcare units must be carried out with the maximum possible effect, the results must correspond to the scientifically predicted ones, it must be substantiated, legal and meet the expectations of the patients.

It is necessary to introduce and use the following criteria for quality assurance of medical activities, which are recommended by the World Health Organization¹¹:

- technical quality, i.e. performance of professional functions;
- use of resources, i.e. economic efficiency;
- control over the degree of risk, i.e. social efficiency, which is the ultimate sought-after result of medical care;
- patient satisfaction with medical care, creating comfort and trust.

In order to work on creating a system of modern technologies that guarantee a minimum sufficient, but the most effective path for the patient, the implementation of a common quality management system is possible only with the coordinated efforts of managers and medical professionals.

It is necessary to carry out preliminary quality control, which should include the requirements for the qualification characteristics of medical professionals: level of education, certification, certification, licensing, and to develop corrective measures in the quality management system of medical activities.

Conceptual quality management models that can be used include:

- Quality control - operational activities used in fulfilling the quality requirements;
- Quality assurance - planned and systematically implemented activities within the quality system;
- Continuous and general quality improvement - activities aimed at achieving long-term success.

It is necessary to take into account all the factors that affect the quality of medical activities:

- Staffing;
- The material and technical provision of the healthcare unit;
- Improving the qualification of medical specialists;
- Professional adaptation and on-the-job training;
- Observance of the sanitary and anti-epidemic regime in the clinic;
- Management control;
- Observance of norms of behavior;
- Observance of the algorithm for the activity in manipulations;
- Proper implementation of doctors' prescriptions;
- Material incentives (salary).

Regarding the management of the motivation of medical specialists to create commitment, personal attitude, attitude and readiness to perform the work, which should be focused on achievements.

With regard to the evaluation of medical professionals and the evaluation of medical activities, it is appropriate to create a control system that is permanent (systemic and daily) and operational (upon receipt of signals of violations in the work of medical professionals). The control must be objective

¹¹ World Health Organization: <https://www.who.int/>

and based on uniform criteria for all the inspected, to have a benevolent attitude and to exclude the influence of the personal emotions and attitudes of the inspector. The aim is to help medical professionals overcome their mistakes and omissions by developing measures to eliminate them. The control should be planned and carried out openly, by creating a system for documenting the results of the control and they must be reduced to the knowledge of the contractors. The information should be included in the form of a database and analyzes and evaluations should be made.

Use the following techniques to assess the knowledge and skills of medical professionals is recommended:

- Oriented to scientific and technical aspects;
 - - current tests giving an idea of the degree and reliability of the acquired knowledge;
 - - direct monitoring;
- Oriented to psycho-social and ethical aspects - surveys, opinions of patients.

The introduction of medical technologies as assessment methods that will contribute to the provision of quality medical activities, to support the assessment of the work performed and to determine the effectiveness of each activity. They can determine the manner and extent of the practical application of the available medical knowledge, techniques, methods and procedures for diagnosis and treatment. They should be on electronic media to facilitate the mental work of medical professionals and they should have sufficient time for direct contact with patients, and should be periodically checked and corrected if necessary. All activities according to their specifics must be planned and carried out by highly qualified specialists. They must meet the high criteria and quality standards set at the European level.

Conclusion

The management of medical professionals can be defined as the process of achieving the goals of the healthcare unit through planning, matching, selection, retention, release, development and appropriate use. Providing qualified, capable and willing medical professionals is an extremely important aspect of planning, which is one of the most important stages in the whole process of managing medical professionals. Because processes are dynamic, organizational forms cannot be considered ideal and final. It is necessary to ensure flexibility and adaptability of medical professionals. It is particularly important to establish an organizational governance structure that ensures the principle of unity and clear functioning feedback.

The idea of quality must be embedded in all elements of the management process. In medicine and healthcare, it is already accepted as an axiom that it has the greatest importance for the consumer value of medical care and through it has the greatest impact on health outcomes. Recently, there is more and more talk in healthcare about total quality management - a positive change in the health of patients, improving the quality of life of patients with incurable diseases, improving the satisfaction of people who have received healthcare. This implies "total" staff training (i.e. all and constant), "total" participation of all staff in solving quality problems, "total" control (i.e. control of all indicators and quality operators). The real criteria of the quality of medical care are: efficiency, adequacy, relevance, efficacy, satisfaction, timeliness, system. The quality of the health services provided in the healthcare units is assessed by the patient and his/her relatives from the moment of admission to the moment of discharge. That is why at any moment they must form a positive attitude of trust and confidence that they receive high quality diagnostic and therapeutic care and services. Particular attention should be paid to the quality of communications and communication culture in the healthcare unit. The performance of the duty of medical specialists is measured not only by diagnostic and treatment methods, but also by the psychological impact.

New Trends and Challenges in Training of Medical Specialists

Katrin Krahtova-Nasteva¹

¹University of agribusiness and rural development, Plovdiv, Bulgaria

Abstract: Over the last decades special attention has been paid to raising the qualification and training of staff worldwide. This is especially true for medical professionals. The training of medical professionals naturally fills the gap between what they can do and what they should do to achieve the goals of the healthcare unit. Current paper presents a systematic approach to training and development in healthcare units considering needs assessment, definition of goals, design of programs, principles of training, policy of training and development, effectiveness of training programs. Recommendations are provided concerning design, influencing factors and evaluation of training programs.

Key words: medical specialists, training, healthcare.

Introduction

The aim of training medical professionals is to reach the desired level of work as quickly and at the lowest cost, to build and expand the skills and knowledge needed for the position or to gain potential for the future. To this end, original methods are constantly being created and experimented with, which develop the most important management skills and lead to a significant increase in the level of quality of management of medical professionals.

The training of medical specialists can be defined as a systematic process of enriching the knowledge, skills and attitudes of employees in order to improve their performance in the positions, the structural units and the health organization as a whole. The systematic approach to this important function assumes the following sequence:

- identifying and analyzing training needs;
- defining the objectives of the training;
- preparation of training plans and programs;
- determination of the trainers and the requirements to them;
- choice of methods, techniques and forms of training;
- controlling the learning process;
- determining the effectiveness of this process;
- improving the learning process and ensuring its continuity.

In general, several conditions can be formulated, necessary for the successful design and implementation of training plans and programs:

- The individual must be motivated to learn, and he/she will be motivated if he/she thinks it will be useful;
- The trainee must receive satisfaction from the training;
- Performance standards and achievement goals must be set before the trainees;
- The learner needs guidance and feedback on how to cope;
- Learning should be an active, not a passive process. Medical professionals learn best when they do something, not just by listening;
- Training techniques to be tailored to the individual goals and needs of individual participants;
- To apply various teaching methods in order to maintain the interest of the trainees;
- Sufficient time should be given to trainees to "assimilate" what is learned, etc.

Modern information and communication technologies, audiovisual and computer technology allow individualization of training, development of mental and organizational abilities of trainees. Along with the methodological preparation and individual selection of the training programs, an important reserve for increasing the intensification of the training process are the appropriate training methods,

the application of modern technical means, the orientation of the training programs to solve specific tasks of the healthcare unit.

Factors determining the need for training and development of medical professionals

There are several mandatory prerequisites for determining the effectiveness of training, and first of all that should be noted is the need for it to be based on prior planning and assessment of the needs. Lack of judgment can lead to unnecessary or too expensive training, to training at an unnecessarily high or low level. Given the nature of training, training needs can be defined as the difference between the actual and desired state of knowledge, skills and attitudes of medical professionals. They are manifested in a certain level of work performance (desired and actual) - work results and behavior in performing the respective tasks. In this sense, the training needs can be considered as a difference between the desired and the actual level of performance of medical professionals, which is due to gaps in their knowledge, skills and attitudes.

Indicators of the need for training can be:

- change of the applied technology and/or working methods;
- changes in the composition of medical specialists;
- waste of materials;
- poor performance of the set tasks;
- delivery of new equipment, required qualification other than the available one;
- change in the implemented activities;
- increased number of unfavorable results;
- excessive turnover of medical specialists, etc.

All these indicators show the need for training, leading to analysis of the healthcare unit, analysis of tasks and analysis of medical professionals.

Organizational analysis includes specifying tasks, resources, and organizational environment. The policy for the medical specialists, the climate in the unit, the available resources and some external factors, for example, legislation, regulators, etc. are important for the training programs. The analysis at the unit level should determine to what extent the unit achieves the set goals and to what extent the training of medical specialists is a factor for better results in this regard. This analysis includes: a review of organizational goals and plans in the short and long term at various structural levels; analysis of the strengths and weaknesses of the unit; review of the quantitative and qualitative aspects of medical professionals, including their use, etc.

The analysis of the tasks requires a review of the job description and the conditions in which it is placed. Before that, an analysis of the tasks is performed, including differentiation of the individual tasks contained in the given work and listing the stages of the tasks, containing the specific actions of the individual and the necessary knowledge. This includes a study of information about the content of work tasks, the necessary qualities of the contractor, the norms and standards of work behavior and performance. As a result, it is determined what is the desired level of performance and what are the requirements for knowledge, skills and attitudes of medical professionals.

The analysis of medical professionals covers the knowledge, skills and habits of employees. It gives a definition of the quality of performance, studies the characteristics of individuals and their groups placed in a learning environment. This is important so that the training program can be modeled to get maximum results at minimum cost. The analysis of medical professionals aims to determine the actual level of performance and to indicate which knowledge, skills and attitudes should be improved through training. It examines the level of performance and compares it with the standard requirements already defined in the job analysis process. The difference between the actual and the desired level of performance is outlined, on the basis of which the objectives of the training are determined. The analysis at the individual level shows who needs training, which knowledge, skills and attitudes need to be improved. However, in order to reach this point, there must be enough information from the previous two levels.

The analyzes of the unit, the tasks and the medical specialists form the idea of the need for training.

Defining the goals of the training of medical specialists

Based on the analysis of the needs of the unit for training of medical specialists, the goals of the training are formed, which represent a kind of bridge between the training needs and the training programs. The objectives of the training specify the needs and determine what should be the knowledge, skills and attitudes of the trainees at the end of the training.

The clearly stated goal of the training includes information on this:

- what are the criteria that prove that this behavior has been achieved;
- what behavior should be achieved by the participant at the end of the training;
- under what conditions this behavior is expected to change.

In some cases, learning objectives are much more difficult to formulate. When it comes to improving the communication skills of medical professionals, it is not possible to metrify the end result of the training to such an extent. But this should not be a reason not to look for more accurate and clear descriptions of the purpose of training¹.

Properly defined learning objectives are useful in:

- the selection of appropriate training methods, taking into account which elements of knowledge, skills and attitudes need to be improved;
- the definition of the specific tasks both to the participants in the training and to the trainer;
- evaluating the effectiveness of the training provided.

Preparation of plans and programs for training of medical specialists

The preparation of training plans and programs is not a purely technical activity, the perfect implementation of which requires only following certain procedures². It includes numerous creative elements in which a number of variables must be assessed, decisions must be made, compromises must be made, and priorities must be outlined. Moreover, with one ultimate goal - improving the work performance of trainees. Any deviation from this goal means that the unit can afford irrational costs of resources and low efficiency of training activities. A sensible approach requires the unit to constantly analyze and monitor the effectiveness of training.

When organizing training programs, the principles of training must be taken into account, a system of rules that must be followed in the training process.

- Trained health professionals should have feedback on how well they have mastered the material and receive a periodic assessment of the extent to which they are moving towards the objectives of the program concerned. This is useful in several ways. On the one hand, some mistakes in what has been learned are noted and it is possible to correct them in a timely manner. On the other hand, the motivation of the trainees increases, who in the process of periodic assessment are encouraged for their efforts.
- Trained medical professionals must be motivated to participate in the training and to study. Motivation is an internal psychological process for each learner, but it can be influenced by the purposeful actions of the learner. In this regard, all participants need to be aware of the objectives of the training and how it can contribute to achieving their individual tasks and goals: improving job performance, increasing remuneration and opportunities for professional and career growth.
- The study material should be organized and systematized so as to avoid ambiguities and contradictions. The correct arrangement of the provided knowledge and skills requires

¹ Dimitrov, I. Hristeva, E., Enchev, N., Aleksandrova, M. Communication skills in training nurses, Health Management 2016.

² Arabska, E. 2019. Coaching and mentoring in the system for acquiring knowledge and skills. XII International Scientific Conference "Innovation in Technology and Education", Belovo, March 21-22, 2019, Collection of Articles, Part 3, 30-34.

following a certain logic, according to which the medical specialists receive the information consistently and in mutual relation. Otherwise, conditions for tension, disturbances and even indifference to the taught material are created by the trained medical specialists.

- Trained medical professionals must be actively involved in the training process. In this regard, a reasonable selection of appropriate training methods and techniques is required, which allow for the direct involvement of participants in discussions and business games.
- The training should be conducted through systematic repetitions and practical exercises. This facilitates the learning process and is directly related to maintaining the motivation of the participants.

The study material should have practical applicability in the real work environment. Very often medical specialists declare that they are satisfied with the knowledge and skills that are given to them, but do not see a sufficient connection with their practical activity, i.e. they are not convinced enough that what they have learned they can apply in their work³. In connection with this, specific requirements are formed for the content of the offered training programs.

The design and organization of training programs must take into account the resources needed: for the remuneration of trainers; to provide a training base - halls, technical means; for teaching materials; for remuneration of medical specialists who do not perform their duties during the program, etc. The organization of training programs is a process of combining and connecting trainers, trainees and material and technical base and resources in a certain way, at a certain place and time.

A training program could have the following sample structure:

- Topic of the training program;
- Characteristics of the medical specialists - participants in the training: age and gender structure, number, educational and qualification level, professional structure, etc.;
- The main goal of the program: knowledge, skills and attitudes that must be achieved by the participants at the end of the training; what are the expected results; criteria for current control of the achieved results (standards); forms of current control (exams and tests).
- Curriculum structure: main thematic modules of the program for training of medical specialists; justification of the thematic modules according to the ultimate goal of the program; duration of each thematic module; trainers for each of the modules.
- Resource provision of the training program: halls, technical means, teachers, hotel base, canteen, training materials for normal classes, training materials that remain for the participants, others;
- Responsible for carrying out the individual tasks and providing resources;
- Time schedule for conducting the training activities.

Principles for training of medical specialists

The effectiveness and success of a training program for medical professionals largely depends on the proper clarification of the need for training and the preparation for its implementation. The preparation of the training is related to basic principles, on which the choice of methods and techniques for training of medical specialists depends. The main prerequisites for the success of a training program are the readiness and motivation of the trained medical specialists. Readiness is seen as a factor expressing the condition of trained medical professionals. It may be different for individuals and groups of medical professionals. Therefore, it is necessary to group the trained medical professionals according to their ability to learn, which is achieved through the application of special tests. If this is not possible, then the training itself is differentiated. The right motivation presupposes that the trained medical specialists have realized the benefit for themselves from the

³ Dimitrov, I., Fotev, P., Petrov, P. 2018. Interpersonal behavior in the workplace. Contemporary Medical Science, Issue 1 (2018), 49-54.

acquisition of new knowledge, skills, information. Setting individual goals brings better results than the overall goal, motivating the participants in the training course for medical professionals.

If the two main prerequisites are present, then the success of the training is a function of the following principles:

- Significance of the taught material.
- Reinforcement - application of confirmation, praise, approval by the trainer, which strengthens the responsibility of the trained medical professionals.
- Connects between learning and practice.
- Distribution of training. Studies have shown increased training effectiveness in dividing the training course into shorter periods (for example, instead of 10 two-hour, 20 one-hour periods).
- Practice and exercises. The principle is related to the need to practice the acquired knowledge. For example, computer training should be accompanied by practicing what has been learned.

Policy for training and development of medical specialists

The policy for training and development of medical specialists is closely related to the unit's strategy for growth, renewal, high competitiveness and others. At the same time, it reflects the basic philosophy of the management in terms of ways to provide the necessary medical professionals and is the basis of decisions in determining training needs, in designing and organizing training programs, in evaluating their effectiveness, in managing and developing career, etc. The policy of the unit in the field of medical specialists allows to formulate the requirements for medical specialists, after which we move on to the study of the necessary conditions for their development. These include:

- data on the healthcare unit, organization and modes of action;
- resources available to the unit;
- the environment of the unit;
- the applied techniques;
- the technique used in the field of management of medical specialists. In second place are the analytical and creative skills of managers:
- recognizing the goals of the unit and ranking them in order of importance;
- determining the amount of medical specialists needed at the unit and their value expression;
- solving emerging management problems.

In next place are the so-called interpersonal skills, including:

- communication with medical professionals from different levels⁴;
- coordination between the different structural units in the unit;
- coordination within the separate structural unit;
- motivation of medical specialists.

If the unit seeks to "buy" ready-made staff from the labor market and is reluctant to devote time and resources to their training, it will have to spend significant resources to attract and retain the desired workforce by offering relatively high salaries and social benefits. In such cases, several main problems usually arise:

- the labor market does not always offer exactly what is needed for the relevant stage of the unit's development;

⁴ Dimitrov, I., Petrov, P., Fotev, P. 2019. Effectiveness of communication in medical teams. Medical store, issue 3 (2019).

- the possibility of disturbances in the organizational climate in relation to the tolerance of some and discrimination of other medical professionals with regard to working conditions and pay;
- difficulties in adapting newly admitted medical professionals to work teams, given that even the best-trained newly appointed medical professional needs introductory training to facilitate and accelerate the period of adaptation to the new work environment;
- the possibility of conflicts arising from the discharge of medical professionals who are no longer needed.

All these problems will be exacerbated against the background of current trends for continuous technical, technological and organizational changes.

If the unit focuses on the other approach in providing the necessary medical specialists - newly admitted and available medical specialists with a certain level of qualification are developed and improved through targeted training in accordance with current and future needs of the relevant structural units and positions. Here, the training of medical specialists is also a means of motivating staff by providing opportunities for professional development and growth in the service hierarchy, to unite work teams and to integrate medical professionals into the values and culture of the healthcare unit.

Effectiveness of training programs for medical professionals

The evaluation of the training of medical specialists is necessary in order to justify the costs of the healthcare unit in connection with this activity against the background of the achieved benefits. On the other hand, it also influences the behavior of the trainees themselves, who know from the very beginning that they will have to evaluate the processes in which they participate. This, other things being equal, increases their motivation and improves their attitude to the overall training activity in the unit.

At this stage, different answers are given: what are the costs incurred with the training, whether the training course should be continued or suspended, whether changes in work should lead to changes in the training course. The effectiveness of the training of medical professionals is generally assessed. This is a conditional issue, as the ability to benefit from training depends on the type of work. The effect of training courses for medical professionals performing relatively simple tasks is easier to predict. It has been proven that the benefits outweigh the costs when the learning objectives are clear, when using well-chosen training methods depending on the work performed, when there is good motivation of the trainees⁵. Increased quality of work is considered to be a significant benefit for the unit from the training of its medical specialists; the possibility for the trainees to be elevated in the hierarchy; the reduction of unfavorable results, leaving the unit, etc.⁶

When assessing the changes in knowledge that have occurred after the implementation of the program, the following are usually used: the forms of the traditional exam; a variety of tests of questions with several possible answers, of which the correct ones must be indicated; tests, including sentences that have been started and must be completed by the participants, etc. Various tools are used to assess changes in participants' attitudes, the most popular of which are the so-called "semantic difference scales". They are relatively easy to design and implement in which they reflect his opinion.

When assessing changes in the skills of medical professionals, techniques are applied, which are summarized in two main groups - technical skills and social skills. When assessing technical skills, the

⁵ Dimitrov, I., Petrov, P., Stefanov, T. 2018. Assessment of the quality of communication in healthcare facilities. UARD Collective monograph series: Sustainable development and competitiveness of regions, Book 1, Academic publishing house "Talent", University of agribusiness and rural development, Plovdiv, 2018, Seventh part "Topical problems in health care and services in regions", 251-256.

⁶ Dimitrov, I., Fotev, P., Petrov, P. 2018. Interpersonal behavior in the workplace. Contemporary Medical Science, Issue 1 (2018), 49-54.

skills of medical professionals to perform a specific job task are tested. When assessing social skills, different techniques are used - role-playing games, structured surveys, group discussions⁷. As a result, participants receive assessments of various dimensions of their social skills - proposing new ideas, interacting with colleagues, managers and patients, summarizing and analyzing information, impact on others, etc.⁸

When assessing changes in the work behavior of trained medical professionals, the methods of direct and indirect observation and self-assessment are most often used. Relatively the most labor-intensive is the direct observation, in which during the whole working day or part of it the labor behavior of the respective trainee is observed. In indirect monitoring, conversations are held with people who can provide information about the work behavior of the trainee - direct supervisor, colleagues and patients. Valuable information in this regard can also be derived from the periodic evaluations of the medical specialists in the unit (of course, this depends largely on the qualities of the applied system for periodic evaluation in the unit).

Another method used to assess changes in behavior is self-assessment. In its most elementary version, the self-assessment is made by each participant answering in free form the question: "Do you think you will change your activities after this course? In what aspects will the changes be?"

The evaluation of the results of the training of medical specialists at the unit level is relatively the most difficult. Here is analyzed the change of a number of indicators that reflect the work results of the participants in the training - quality of work, turnover, causeless absences, unfavorable situations and results, etc. It should be borne in mind that these indicators reflect the influence of a number of factors, including training. The changes in these indicators should not be explained solely by the results of the training, but they prove that the training also contributes to the final overall results of the unit. In the process of evaluating these indicators before and after the training, interviews can be conducted, both with the participants in the respective course and with their direct supervisors and to identify a number of barriers that hinder the practical application of what is learned from the respective programs.

The practical activity of evaluating the results of training of medical specialists shows that:

- the benefits of training in many cases outweigh the gains associated with improving task performance;
- the benefits of training are more easily determined for physical than for mental work;
- it is easier to determine the result related to the improvement of the quality of labor than to the limitation of the need for control, unfavorable situations and results, labor turnover;
- the cost of off-the-job training is easier to determine than that of on-the-job training.

Different combinations of these approaches are used to assess the effectiveness of training, taking into account their specifics. Research shows that informal surveys of the direct supervisors of the participants in the training are most often used, as well as the forms for assessing the reactions immediately after the course. Tests to assess knowledge, skills and attitudes before and after training are relatively less common.

In order for a training program for medical professionals to be effective, it must generally:

- motivates the trainees to improve their performance;
- illustrates the desired skills;

- ensures active participation of the trainees;
- provides an opportunity for immediate practice;
- provides timely feedback on the performance of trainees within the unit;
- be structured in the direction of simpler to more complex tasks;
- be adaptable to specific problems;
- encourages the positive transfer and use of what has been learned in practice.

Conclusion

A number of activities can be recommended, taking into account the best experience, which can support the first and most positive changes in improving the effectiveness of training of medical professionals.

First: the heads of the units responsible for the training and development of the medical specialists in the unit can put into practice the observance of the following basic principles for the effectiveness of the training:

- Medical professionals must be motivated to train. They must have a clear idea of what is expected of them and what level of knowledge and skills they must reach (definition of criteria).
- Trained medical professionals must have clearly defined achievable goals (definition of goals).
- In the process of training they must be guided, supported and evaluated (implementation of guidance).
- The training must satisfy the realized one or several needs of the trained medical specialists (motivation of the medical specialists).
- Training must be an active process.
- Depending on the specific case, the most appropriate methods for training medical professionals must be determined in advance (choice of methods and means).
- The methods of training of medical specialists must be varied and alternate in an appropriate way (alternation of methods).
- It is necessary during the training of medical specialists to leave enough time for perception, assimilation, assimilation and verification of knowledge and skills (control over the intensity of training).
- It is necessary to monitor, stimulate and correct the behavior of all trained medical professionals (behavior management).
- Different levels of training require different duration and application of specific methods (differentiated design of training of medical professionals).

Second: the heads of the training and qualification units, together with the human resources management departments, can activate the following factors contributing to the effectiveness of the training of medical specialists:

- Making a close link between the unit's strategy and training.
- Maintaining active contact between the head of the qualification and the unit.
- Providing own budget for the training of medical specialists.
- Carefully identify the training needs of medical professionals.
- Clear definition of the training objectives of medical professionals,
- Ensuring close contact between the training participant and the line manager.
- Treatment of individual development as part of the change in the work and development of the unit.
- Basing the methods of training medical specialists on the experiment.

- Discussion during the training of medical specialists of the possibilities for application of what has been learned and/or for overcoming the barriers to its implementation.
- Undertaking special measures for implementation of what has been learned immediately after the completion of the training.
- Focusing on both the long-term effect of medical training and the short-term.

Third: the heads of the qualification units can put into practice a method for complex evaluation of the training programs, which should include the following more important steps:

- Calculation of costs for each component of the program (direct and indirect costs are included).
- Evaluation of the expected effect of the program (to what extent its goals will be achieved).
- Monitoring and control of the evaluation process.
- Analysis of the reports evaluating the implementation of the program
- Decision making based on the analyzed reports, etc.

Motivation of Medical Professionals

Katrin Krahtova-Nasteva¹

¹University of agribusiness and rural development, Plovdiv, Bulgaria

Abstract: Despite the colossal achievements in the field of technology, organization and information systems, man remains the main productive and creative force, which is only able to unite other factors and provide the most essential attributes of economic progress - high productivity and efficiency. Problems of motivation are not new to management science, but they acquire unknown, unexpectedly important dimensions in moments of crisis for management. In our practice they are related to the need for a complete change of the management system according to the rules of the specific model in the conditions of the coronavirus crisis. Current paper presents a study of the motivation processes in healthcare institutions and provides some concrete recommendations concerning motivation factors and models.

Key words: medical professionals, management, motivation.

Introduction

Motivation is a complex process. Not without reason, some authors point to motivation as an equal management function with the organization, planning, leadership and control¹. The problems of motivation acquire essential importance for the successful functioning of economic entities in market conditions. Motivation can never remain hidden in a person. It is realized outside. The first thing to do in the process of motivation is to find that need that is most important to a particular person or that goal that is extremely important to him/her. The process of motivation begins with someone who consciously or unconsciously recognizes an unmet need. Then a goal is determined that is supposed to satisfy the need, a chain of actions is determined by which this goal is achieved and thus to satisfy the need. The process of motivation begins with the identification of the need. One of the main reasons for the complexity of this process is because individuals differ so much, it is impossible to make a universal law that provides for how all people will behave in certain circumstances.

Based on Maslow's theory of needs and their hierarchy, only one satisfied need can motivate behavior, and the dominant need is the main motivator of behavior. When a need is satisfied, the higher becomes dominant and the individual's attention is focused on satisfying that higher need, although the need for self-expression can never be satisfied.

Needs, desires and expectations are the things that give energy to the behavior of medical professionals. Decisions and actions (internal and external behavior) are what channel human behavior. Through motivation, a person gets closer to his goals. And achieving goals is a new energy that is feedback to consumers, desires and expectations.

A significant problem is the choice of the motivational strategy and policy for medical professionals to ensure their maximum involvement in the goals and objectives of the healthcare unit. This could be achieved only in the context of the overall improvement of the management system of medical professionals and the management of the unit as a whole. A significant part of the solution of the problem is related to the theoretical and practical rethinking of the model of motivation and its adaptation to the specifics of the system of needs, motives, interests and values of the medical specialists. In the concrete reality, in the conditions of deep crisis, motivation is rightly given priority as an inexhaustible source of additional creative energy. This leads to an increase in attention to motivational issues in theoretical and especially in applied aspects. There is a growing need for its management by managers at all hierarchical levels.

Motivation is a process based on the existence of unmet needs of the individual. The initial impulse, the awareness of the need, results in the increasing tension in the person. On this basis, energy is released and directed to behavior oriented to meet the corresponding need. By accepting a priori that people are intrinsically motivated to work, that they prefer to work rather than stay, that they

¹ Zahariev, E. 2015. Fundamentals of management. Academic publishing house "Talent", University of agribusiness and rural development, Plovdiv.

naturally strive for self-improvement, I defend the understanding that medical professionals should be given freedom of work, that they should the manifestation of their hidden abilities in the search for and realization of the most effective solutions is encouraged².

Motivation is an activity for developing models, methods and tools, which create incentives for effective and creative work of medical professionals in achieving their goals. Hence the complexity of the problem - to combine the goals and motives of individual medical professionals with those of the system and the unit, achieving an understanding of a common goal. This is a rather complex creative activity, which involves first studying all the causes and factors that affect the system of diverse needs, interests and motives of medical professionals, and secondly constructing a system for motivating medical professionals in the unit.

Motivation in modern organizations

Before the Industrial Revolution, the main ways to motivate at work were remuneration and punishment. Now, human resource management is a new philosophy that offers a new approach, which in the eighties began to consider motivation as a complex process. It is a network of interrelated factors, needs for friendship, needs for achievement, expectations, etc. In different people, however, the motivation is different, in the sense that everyone is motivated by different combinations of factors.

The modern multivariate approach to motivation is based on three main factors in the organization: the individual; labor characteristics; working environment. The emphasis is on the interactions between the three factors. The individual may have a great and strong desire to work well. This is the first factor for motivation, but it alone is not enough. The other two factors are also needed - the characteristics of work and the work environment, as well as the interactive connections between them. For example, the work of the individual can bring internal rewards, be liked, be attractive, be diverse. However, the colleagues, the climate or the culture of the organization may not be attractive. Then the motivation of the individual will be less.

Namely motivation makes medical professionals act or behave in the way they perceive. When observing certain actions of medical professionals, their managers ask themselves: "What are their motives?". If they want to do something, they ask themselves "How can we motivate them?". It can be argued that for the correct explanation of the rules and principles of managerial influence on medical professionals, it is especially important to define the factors of motivation.

There are several classic approaches to clarifying behavior and motivational factors:

- a) Freudianism, in which motivation is assumed to be a "game" of conscious and unconscious, of motives and instincts, but instincts play a leading role;
- b) behaviorism, which is based on the fact that human behavior and its motivation are regulated by needs, rewards, goals;
- c) cognitivism, in which it is assumed that human behavior is guided by expectations, beliefs, hopes, values, which are the result of knowledge and perceptions of people;
- d) hedonism, which formulates the idea that people by nature tend to seek pleasure, reward, good and attractive work and avoid inconvenience, punishment, suffering, difficulties, difficult professions.

It should be noted that there is no consensus in the literature on motivational factors. For the correct and thorough clarification of this complex problem are important not only the classical concepts, but

² Zahariev, E., Arabska, E. 2014. Eclectic concepts for distribution and popularization of good management practices. VII International scientific conference "Innovations in technology and education", March 2014. Ministry of Education and Science, Federal State budget institution of higher education "Kuzbass State Technical University named after T.F. Gorbachev", St. Cyril and St. Methodius University of Veliko Tarnovo, Bulgaria, Branch KuzSTU in Belovo, University of Agribusiness and Rural development - Plovdiv, Bulgaria, Belovo, March 2014, pp. 149-153.

especially the development of the so-called "humanistic psychology" which opposes the narrow view of the individual outside the context of the multifaceted environment and interrelations³.

The original interpretation of the question of motivational factors is made by the famous American specialist Frederick Herzberg, who distinguishes two groups of motivating factors:

- Factors that allow to increase satisfaction: achievements; recognition of achievements by others; the work itself; responsibility; career development; opportunity for self-realization.
- Factors to reduce dissatisfaction and dissatisfaction with work (so-called "hygiene factors"): policy and characteristics of the organization's management; material working conditions and safety at the workplace; salary; the relations with the members of the group to which the person belongs; personal life; relationships with subordinates; social status; social security.

It is interesting to note that according to Herzberg real motivating factors are those of the first group, and "hygiene factors" are considered only as a necessary condition for normal operation and a prerequisite for the manifestation and use of the other group of factors for management purposes⁴.

Without striving for a clear grouping, the factors that reveal some of the most important aspects of motivation are:

- The expectation that a certain behavior will lead to the desired results;
- The experience gained in taking action to meet the needs;
- The system of incentives (the value of incentives and the realization that the incentive depends on effort);
- Abilities - intelligence, knowledge and skills of the individual;
- Perception of work - what the individual wants from the job or thinks it is required of him/her. From the point of view of the unit, it is desirable to obtain a match between the personal perception of the work and the requirements of the unit;
- The influence of other people - the group influence of colleagues, family or other social groups to which the person belongs, is important because it affects social needs and the need for evaluation;
- The work itself - the degree to which work creates opportunities for achievement, responsibility and satisfaction.

It can be summarized that people's behavior in the labor process is determined by three main groups of factors:

- Factors related to the individual characteristics of the personality: human abilities, qualities and character, including the degree of maturity or stage of development reached by the individual; the needs, interests, goals and aspirations of the people, reflected in the individual work motivation; commitment to the organization and its values.
- General motivating factors representing the impact of the general economic and social environment on the individual: the level of needs of people and their families; the state and development of the commodity and money market; the state and development of the labor market.
- Immediate motivating factors reflecting the impact of the organizational environment on staff: the level and dynamics of wages; recognition of achievements in work; the participation of the staff in the activity of the organization and in the distribution of the profit; opportunities for the development of individuals; the level of distribution and

³ Humanistic Approach: <https://www.simplypsychology.org/humanistic.html>

⁴ Zahariev, E. 2015. Fundamentals of management. Academic publishing house "Talent", University of agribusiness and rural development, Plovdiv.

cooperation of labor; the expansion of group forms of work; the organization of work in the workplace; working and safety conditions; the socio-psychological climate, etc.

The logic of such an assumption does not exclude the finding that this grouping of motivational factors is still quite conditional, as far as some "overlap" of elements of the three groups can be allowed. However, this can be considered natural, because at least for now it is not possible to prove the exact relationship between the level of motivation and the influence of individual factors, moreover, that they do not act in isolation, but connected with each other. Clear grouping and categorical limitation of the influence of individual factors is difficult also because different people are very differently and too specifically influenced by these groups of factors - their behavior can fundamentally change the general theoretical positions about the importance of different motivational factors.

The following demotivating factors leading to frustration have a particularly important modern sound: gaps in the organizational structure; manifestations of bureaucracy; gaps in management technology; untimely regulation; subjectivism in personnel policy; disorders in interpersonal relationships; excessive centralism; uniformity and template in the management; bit; objective lack of development horizon; tendency to perceive the phenomena from their negative side; old age; tendency to guard forces; recreational resources.

Motivation is negatively influenced, therefore repulsively, by such moments in management as: the emphasis on the quantity and not on the quality of the work performed; underestimation of the capabilities and abilities of subordinates; standardization and depersonalization of the activity of individuals; the results of the organization's activity are not assessed as socially significant; subordinates are not encouraged to experiment with new forms and methods of work; creating an environment in which people feel insecure in their actions and in the correctness of the decisions made, etc.

The study of motivational factors makes it possible to establish the so-called. motivational profile of the group, which allows more targeted and more effective influence on both individual and group work behavior⁵.

Motivating the staff in the healthcare institutions

Until the 1950s, simpler theoretical generalizations of behavioral motivation were used in management. However, since the 1960s, the topic of motivation has become increasingly important in the theory and practice of management. One of the avant-garde mechanisms, for example, is based on the theory of human resource management. Motivation in management arouses the interest of managers and researchers almost as much as communication in management. What are the reasons for this interest?

The first reason is that motivation refers to the most important resources of the modern organization - these are human resources. It is believed that the effectiveness of the organization, as well as its excellence, is achieved on the largest and fastest through people. The aspiration of leaders is to manage their organization through human resources. The strategy for attracting, maintaining and reaching an agreement with the medical specialists is always developed carefully and precisely, and the main techniques in it are the motivational ones.

The second reason for the huge interest in motivation is that it is different for different medical professionals. They differ in style and motivation. Their behavior in the unit is a result not only of personal motivation, but also of the influence of the environment on the motivational structure of medical professionals.

The third reason that strengthens the interest in motivation is the new concept of organizational efficiency. To a large extent, it is already perceived as a matter of the ability of the managers themselves to motivate the medical specialists in the unit to achieve the goals and other criteria for effectiveness.

⁵ Zahariev, E. 2013. Challenges to industrial management: priorities and solutions. Academic publishing house "Talent", University of agribusiness and rural development, Plovdiv.

The fourth reason is that the healthcare units have recently been thinking strategically about human resources and seeking to create the so-called "Talent bank". They make special efforts to "raise" suitable specialists and to develop them. At the heart of programs for training suitable staff, career planning, remuneration, work organization, official communications, etc. is the motivation⁶.

The variety of motivational models shows that there are alternative ways in the approach of managers in choosing the most appropriate forms of impact on people. It cannot be said that there is one best, universal motivational model applicable in all cases. When applying any model, it should be borne in mind that in the specific conditions of economic crisis in our country there are many medical professionals who can "voluntarily" distance themselves from the needs of some lower levels, which allows more to use motivational factors effectively. To this end, as well as for the general increase of the ability to motivate, managers must adhere to some simple rules in their work:

- To strive to understand the needs of their subordinates, according to the classification of E. Maslow;
- To study not only what they need, but also what they want. Even if they are unable to provide it for them, managers could change their approach to motivation depending on the wishes of medical professionals.
- To try to grade the motivational factors for the individuals and to use them skillfully depending on the specific possibilities of the unit at any time;
- Remember that money is not the only incentive that medical professionals need and strive for. Medical professionals can be motivated by promotion, by the work itself, by recognition, praise, the opportunity to achieve additional results or take on new responsibilities, and more. Sometimes such incentives can be more effective than monetary rewards.

For some medical professionals who have their material needs met at lower levels, the following circumstances would have a motivating effect:

- granting greater power;
- opportunities for rapid growth in professional and hierarchical lines;
- ensuring a sense of security;
- transfer to such a unit, which provides the best opportunities for complex development of the personality and a suitable environment for the manifestation of the specific individual abilities;
- ensuring a certain social status, which according to the individuals is very dignified and prestigious;
- an opportunity to participate in the management of the organization and in making strategically important decisions;
- an increase which they may receive from others;
- assignment of such tasks, which contain risk, surprise, test of will, for which some persons have inclinations;

⁶ Dimitrov, I., Petrov, P., Irmov, V. 2018. Organizational development - model "Organizational cone". UARD Collective monograph series: Sustainable development and competitiveness of regions, Book 1, Academic publishing house "Talent", University of agribusiness and rural development, Plovdiv, 2018, Seventh part "Topical problems in health care and services in regions", 257-264.

Dimitrov, I., Irmov, V. 2018. Study of the specifics of communication between the different levels in the health facility. Proceedings of the International scientific and practical conference "Bulgaria of regions'2018": Socio-economic zoning: traditions, contemporary state and problems, 19-21 October 2018, University of agribusiness and rural development, Plovdiv, Bulgaria.

- full employment and work corresponding to the level of qualification, as well as the regular change in the nature of the work;
- encouraging creativity;
- awareness of the ultimate goals and results of the operation of the unit;
- opportunities for constant facilitation of the work by introducing the top achievements of the scientific and technical progress for automation and intellectualization of the work;
- permanent opportunities for mastering new knowledge;
- opportunities for closeness, interaction and contacts (formal and informal) with persons from the highest levels of management in the unit, etc.
- In the practical solution of the problem of motivation to approach comprehensively. The influence of individual factors must be considered in their interrelation and the influence of social and personal preconditions must be taken into account⁷. Assess also that motivation is not just a matter of giving more money. Assess also that motivation cannot be achieved by creating a sense of satisfaction - too much emphasis on it can lead to complacency and inertia.
- Take into account the importance of expectations and their impact on motivation. The reward will be more effective if medical professionals know in advance what they will get for a job well done. To this end, the link between effort and remuneration must be clearly emphasized, as the requirements and tasks set for medical professionals are not easy, but they are not impossible. It should be clear to medical professionals what they will get if they do a good job, but also what they will not get if they fail. They should also know that for good achievements they will receive praise, a special award or greater opportunities for performance, but the award itself should not be devalued and should be given only when it is really deserved. While the reward can be defined as a positive factor, insofar as medical professionals strive for it and after achieving which they feel satisfaction, the effect of punishment as a form of motivation is more complex. While the award is determined for factual situations, it reinforces the positive attitude of medical professionals towards the work. However, punishment does not always eliminate the tendency to negative behavior, so it must be applied with special care so as not to become a factor of frustration. Improper application of punishment causes bad mood, hostility, tense atmosphere and even causes aggressive behavior of subordinates. It should be borne in mind that the faster or faster the reward or punishment. Rewards and punishments should be a universal system of influence in the unit. They must form a balanced system and be used in the correct gradation, accurately measuring the strength of the stimulus or sanction against the severity of the positive actions or transgressions.
- To know well the psychological types, the peculiarities of the individual and other socio-psychological characteristics of the personality, in order to use individually in the motivation those factors that have the strongest influence and to the greatest extent involve the medical specialists in the goals of the unit.
- Recognize that group influences strongly influence motivation. Therefore, leaders must do everything necessary to win over the groups on their side, from formal leaders to take leadership positions.
- To periodically do research in the unit which hinders motivation and not to forget that the same stimulus acts differently on different people.
- Objectivity and fairness in assessments and remuneration, effective feedback, etc.

The main methods to determine motivation are:

⁷ Dimitrov, I., Fotev, P., Petrov, P. 2018. Interpersonal behavior in the workplace. Contemporary Medical Science, Issue 1 (2018), 49-54.

- Use of money as a reward and incentive;
- Imposition of requirements;
- Motivation through work;
- Development of empathy;
- Recognition and publicity of achievements;
- Emphasis on group work;
- Staff training and development;
- Elimination of negative things at work;
- Exercise leadership.

Remuneration of medical professionals: Money, as a means of payment or other form of remuneration, is the most obvious form of reward. Money is the lure that most, if not all, people want. In order to effectively use money as a motivator and to avoid its action as a demotivator, the manager must: pay competitive salaries to attract and retain medical professionals; to provide a salary that reflects the value of the work for the unit, as well as to pay fairly and fairly; to link pay with performance or results as far as possible, and thus to give a direct incentive to work.

Imposition of tests: Motivation is not just a matter of giving rewards and incentives. Healthcare professionals need to know what they are expected to do and what will happen to them if they do not. They must be aware of their role, the goals that must achieve the required standards of performance and behavior. They may be aware of the rewards in the form of money, promotion or improved status that will follow from the compilation with these expectations, but they should also be aware of the sanctions that will follow if they fail.

Development of empathy: The manager should do everything possible to increase empathy and identification with the unit. Its aim should be to integrate, as far as possible, the needs of the unit with those of the medical professional, so that the latter believes that if the unit prospers with his/her help, he/she will prosper as well. Medical professionals can work hard if they believe in the unit's mission, and can identify with its values, goals, and activities; they will work even harder if they feel that there will be something for them in achieving the desired results of the unit.

Motivation through work: By providing a fair and competitive pay structure that, as far as possible, offers effective financial incentives, the manager can increase identification and provide long-term motivation by developing an internal incentive system. Internal stimuli are at the heart of work and give satisfaction, allowing people to feel satisfied, to express and use their abilities, and to exercise their own decision-making power. Motivation through work itself is a major issue of constructing work and enriching it.

The award and recognition of achievements: The pay system can be designed to link rewards to achievements, but the leader must also reward people by giving them more responsibilities (internal reward) and more opportunities for promotion and promotion (external rewards). Achievable rewards are very good when they are deserved and medical professionals appreciate this fact. The award for a job well done is an important motivator, as long as it is once again deserved. It depreciates when given too freely.

Exercise leadership: Leadership plays a key role in motivation. It develops empathy and identification, but it also gives a sense of direction. It can clarify roles and goals, develop group spirit. Inspired leadership by charming personalities who make everyone accept what is sometimes called "super-ordinated goals" – i.e. goals above and beyond a sense of duty - may be appropriate in some conditions, such as during a crisis. But a cool, calm and restrained leader who pulls people after him/her because he/she knows clearly where he/she is going and how to get there - with the help of his/her team - can be equally effective in certain situations.

Team building: A cohesive team will engage all its members with it. Enthusiasm is contagious, so if a manager can create enthusiasm for his/her team's task, he/she is much more likely to get everyone to go their own way. Team building activities aim to achieve a strong bond and overcome the negative influences that groups can cause.

Training and development of medical specialists: The systematic training and development program motivates by enabling medical professionals to expand their skills and reach positions of greater responsibility. Sending someone on a course can be a good way to show them that they are valuable. Unit training programs, especially on-site ones, can help improve the identification of health professionals with the unit.

Eliminate the negative sides: In addition to the positive contribution of motivation, there are also negative aspects, as described by Herzberg (hygiene factors), which the manager must minimize. One is the unfair pay system; the other is poor working conditions, inadequate supervision and unjustifiably restrictive or bureaucratic practices.

The main *motivators* can be grouped as follows:

- First, *the development of medical professionals*. This possibility can be realized if in the unit the content of the work is constantly enriched, it is intellectualized and becomes creative; the professions - wide-profile, the qualification - multifunctional. Medical specialists are motivated when the work is interesting for them, it is not too easy and executive, but they can actively participate in it, show initiative and have the opportunity to make suggestions for its rationalization. The development of medical specialists presupposes the creation of conditions by the unit for their continuous training and self-training, for creative, professional and personal self-improvement. Particularly effective motives for medical professionals are created when development is associated with career advancement. Here the main place in modern conditions is given to the growth horizontally - from some activities - to others, with a richer content of labor, without vertical hierarchical movement.
- Second, *recognition and respect*. The unit must create conditions - on the one hand - for recognition of the achievements in the work and professional development of each medical specialist by managers and his/her colleagues, and on the other hand - self-recognition of their own success and achieving self-confidence and authority of each person. The idea should be supported not only for the medical specialist to adapt to the goals and requirements of the unit, but also for the latter to adapt to the specifics of the individual, something that is not yet applied in Bulgaria.
- Third, *social contacts*. When a person is accepted as part of the team, part of a certain social group, his/her need for social belonging, for action is satisfied. This is a prerequisite for both highly effective activity and personal development. The most suitable form for the development of social contacts is teamwork. Good relationships make work easier and lead to increased work efficiency.
- Fourth, *security*. Perceptions of it have changed significantly with the adoption of the concept of a 'flexible workforce'. Today, job security is associated with mobility, flexibility and adaptability to change. And this means continuous professional development not only for the performance of work duties, but also for survival. However, clear rules are needed that redundancies will, in any case, remain the best, and not, as is often the case, the use of various other criteria. Security in the new conditions is also related to strengthening solidarity between medical professionals to compensate for the risk of rapid and radical change. And also the responsibility of the unit (along with the state) for social protection in case of loss or transformation of employment, for retraining and reorientation of the affected workforce.
- Fifth, *the salary*. Its level and dynamics determine the possibility of satisfying not only the material (physiological), but also a significant part of the spiritual and social needs of the individual. In addition, for the majority of staff, the salary is still the main, the main motive for active work participation, as well as for professional development. with the professional career system. In many cases, when the salary system is not set up properly, the distribution of salary is unfair, it not only does not motivate, but can demotivate medical professionals.

- Sixth, *cooperation between the heads of the unit and the medical specialists*, instead of the usual schemes of hierarchical subordination. The cooperation is built on the unity of goals between the two parties in the value system of the unit, which can be formalized in a moral code. This can undoubtedly happen when building a relationship of trust and openness. On the one hand, the management provides complete information about its actions, and, more importantly, listens to all possible suggestions and ideas from medical professionals. The dominant model of interaction and communication is that of cooperation, not obedience.
- Seventh, *power for all, based on common views, values, trust and perseverance*. The empowerment of specialists in social systems and organizations is a key element of cooperation, but it also has an independent role in motivating staff. "Empowerment" is understood and is based on the assumption that each person is driven by the inner motive to do real things in the right way, regardless of his/her position in the hierarchy or the level of power he/she has. Such a motive is considered to be a basic human position, which on the basis of the assessment of the real situation and the abilities and experience of each one generates the respective autonomous decisions. At the same time, the person understands the need to be responsible for his/her decision and the consequences of it. The "authorized" person is considered as a subject, not as an object of interactions in the system and the organization. Viewed in this way, "empowerment" is also understood as an expression of man's most natural and principal desire to determine his/her own destiny".
- Eighth, *evaluation of the activity of all medical specialists*. Motivation is achieved, on the one hand, by imposing requirements through clearly defined goals, standards and expectations related to the result (positive or negative), and, on the other hand - by objectively, fairly presenting the results to each medical professional. The importance of the assessment is determined by the fact that it is the basis for building science-based systems for the development of medical professionals (training, professional career), for the salary, as well as for the selection and dismissal of medical professionals. Thus, evaluation is a motivating factor with both direct and indirect action, through these systems, which have a decisive influence on the motivation of medical professionals.
- Ninth, *the provision of fair, safe and healthy working conditions and favorable living conditions* for medical professionals has a great motivating effect. They are an element not only of social policy, but also of management. Because it is difficult to imagine that a person who works for a long time without a break, in harmful, unhealthy working conditions, will be able to be creative in their work and will develop. And further - that if he/she has no home, travels long and hard, has nowhere to eat, to rest, he/she will be motivated for highly efficient work. And vice versa.
- Tenth, *leadership based on competence* (rather than position in the hierarchy), the formation, maintenance and management of relationships; the ability to work with a group, respecting everyone's opinion and recognizing their results; of attracting medical specialists in the management (empowerment) and creating a healthy socio-psychological climate in the team. But for this, in addition to the above qualities, the leader must also be fair, honest, hardworking, educated, etc. This type of leader and leadership is still unknown for the Bulgarian conditions, but it is already obvious that although slowly and painfully this management system will make its way in our country as well.

The main skill of the leader therefore becomes communication⁸. There is no such thing only from top to bottom; there is a permanent one on both sides. All issues and problems that affect the work are subject to discussion.

⁸ Dimitrov, I. 2020. Communicative skills, an effective way of health management. Intel Design Ltd., Plovdiv 2020.

Based on the above, a *motivational strategy* could be proposed, which also takes into account the requirements for job satisfaction and for a positive work attitude and empathy for the unit:

- Defining and expanding the mission and the main "philosophy" and values of the unit, as well as its strategic priorities;
- Setting challenging, but achievable, group and individual goals with the active participation of medical professionals. Formation of common organizational goals in search of an opportunity for the individual aspirations and intentions of each to fit in some way into the general goals of the unit. Use every possible means of communication to ensure 100% certainty that the signals of mission, values and strategies have reached every member of the team. The individual goals in the unit are directly related to the needs and therefore the regularities that have already been mentioned must be taken into account here.
- Finding ways to ensure participation in management, to involve medical professionals in clarifying problems and developing options for solving them in order for them to feel the changes as a consequence of their own will for them. Using general meetings, discussion groups and any other similar forms to get medical professionals to discuss the problems of the unit and to be able to use their ideas in front of an audience. Mass dissemination of information about the activity and results of the unit.
- Suggesting - through examples and training - the confidence that the management style in the unit is right to encourage empathy and collectivism, that everyone's opinion is valued.
- Search for leadership that inspires and "infects"; appointment of management staff and team leaders with the ability to motivate; organizational and behavioral training of the current management staff.
- Designing structures and positions so that the medical specialists occupying them feel the feeling of completion of the work, to be able to apply and develop their knowledge, skills and abilities. Providing guidance and training that would enable health professionals to use and develop their abilities to the fullest.
- Providing a feedback system for work results. Disclosure and explanation between the performance and the remuneration. Creating expectations that certain behaviors and outcomes will lead to appropriate rewards that, in the judgment of the medical professionals themselves, would be worth the effort.
- Ensuring the respective financial remunerations for the labor achievements. Their involvement in a system of evaluation and remuneration, which is focused on the effectiveness of teamwork and meets the requirements of fairness. Maximum linking of individual remuneration with skills and mastery. Providing non-financial remuneration of all types on a current and periodic basis.

Conclusion

Dimitrov, I., Fotev, P., Petrov, P. 2018. Structure and essence of group communication in medical teams. Contemporary Medical Science, Issue 2 (2018), 51-56.

Dimitrov, I., Perov, P. 2019. Peculiarities of communication in medical teams. National Union of Obstetricians and Gynecologists from Pre-Hospital Care, 2019.

Dimitrov, I., Petrov, P. 2018. Study of the connection between good communication in healthcare facilities with the quality of the offered health service and the image of the healthcare institution. Proceedings of the International scientific and practical conference "Bulgaria of regions'2018": Socio-economic zoning: traditions, contemporary state and problems, 19-21 October 2018, University of agribusiness and rural development, Plovdiv, Bulgaria.

Dimitrov, I., Petrov, P., Fotev, P. 2019. Effectiveness of communication in medical teams. Medical store, issue 3 (2019).

There is no universal theory or approach to motivation. Although each of the considered approaches is liked to a different degree intuitively, none of them can be perceived as the only right way. To achieve the best results, the manager must be able to diagnose each situation and apply different motivational principles as appropriate.

Motivation is a complex process. Motivation includes at least the analysis of needs, choice of behavior, evaluation of the effectiveness of the work, rewards and satisfaction. In addition to this obvious completeness, managers need to consider the following two aspects: First - medical professionals differ in what motivates them - some highly value money, others rather look at the nature of work, others are motivated by a complex of other factors. It is essential for them to make that distinction. Second, motivation is essentially a learning process, and as such, no immediate results can be expected from it. Motivation is continuous activity.

The reward mechanism in the healthcare unit is a powerful motivating factor. Rewards are a major motivator, as health professionals usually put in more effort the more they get in return - in other words, "what they get for what they do". Although there are important differences between internal and external rewards in motivation, the manager should not rely on just one. Since an attractive job may end up being unsatisfactory in the absence of appropriate pay, both high-paying but boring work will be detrimental to motivation. The leader must learn to combine the use of external and internal rewards.

The manager is a key element in the process of motivating medical professionals. It can influence any team in a person's motivational process. He/she identifies key motivational needs, assists in the selection and conduct of motivated behavior, assists in the training of medical professionals in improving skills and abilities, evaluates work and rewards or punishes their behavior. He/she should not only take into account its important role in this process, but also prepare in stages - how to effectively assess what motivates medical professionals, etc. - how to conduct the interview when evaluating the effectiveness of medical professionals.

With the advent of more and more research and practice in the application of theories of motivation and their methods, one will better understand the process of motivation. Even with so many unknowns, executives today are in a much better position than their predecessors in terms of understanding what makes a medical professional better or what reduces his or her effectiveness.

Sports Tourism – Status And Significance

Kiril Borisov¹

¹PhD, College of Healthcare and Sports –Plovdiv, Bulgaria

Abstract: Sport tourism is an interesting and different kind of tourism. There are not many articles in Bulgaria about its identity and specifications. The main object in this publication is to define the concept of sports tourism and its significance. Sports tourism has many characteristics. The beginning of sports tourism dates back to ancient times. The publication traces the most important stages of its development to the present days. The definitions given in the scientific literature for sports tourism are reviewed and a definition is proposed, which most accurately conveys the essence of sports tourism in terms of at least three prerequisites - motives for travel, product features and the type of experience. The Covid-19 pandemic hit tourism hard, including sports tourism. The economic losses are estimated to be more significant than those caused by the financial crisis in 2008-2012. There is every reason to expect that very soon sports tourism will take its rightful place in people's lives and it will become an important part of the tourism industry.

Key words: sports; history of tourism; specialized types of tourism; prospects of sports tourism; Covid-19 and tourism.

1. Introduction

It has long been known how significant is the influence of sports on the health of the people. Sport and a healthy lifestyle are inextricably linked with each other. This is confirmed by the famous saying: "A healthy mind is in a healthy body!" (*in latin - Mens sana in corpore sano*). One cannot argue with this: as a rule, athletes are decisive and purposeful people, constantly moving forward. The positive effect of sport on human health and character has never been in doubt and has long been scientifically proven.

The impact of sport on human health has long been known. The first level of motivation that motivates a person to travel is physical motivation, which is aimed at restoring the body and soul, wellness goals, pleasure and sports. This is largely determined by the fast pace and high level of stress in the life of modern people, which increasingly stimulates them to actively spend their free time. These factors largely explain the growing popularity of sports and active tourism. One type of active tourism is sports tourism, which, on the one hand, satisfies a person's need for sports, and on the other hand, the need to participate in sports. Passive tourism is one in which people travel in order to attend sporting events that they enjoy as fans. Tourism is such an area of human life that allows him to meet a variety of needs - recreation, communication, knowledge, new experiences and more.

In Bulgaria, sports tourism is an underdeveloped but very promising area of tourism. The purpose of this publication is to analyze the relationship between health, sports and tourism. As far as there is a growing popularity of sports tourism, the relationship is specified on the impact of sports tourism on human health.

2. History of sports tourism

Travel to observe and participate in sporting events dates back to ancient Greece. Today, sports activities are growing in popularity. The term tourism comes from the French "tour" - *travel, excursion*. According to the modern definition, tourism is a trip for some purpose - mostly recreation and entertainment for work, for guests, with cognitive motives, etc. At the same time, tourism is an economic sector with a serious contribution to the creation of GDP (in our country between 12 and 14%)¹, and in recent years there has even been talk of a tourism industry comparable to that of

¹ According to the World Travel and Tourism Monitor, tourism generates 9% of the world's GDP, and for Bulgaria it is already 13.6%. Available at: <https://www.investor.bg/na-fokus/441/a/turizmyt-shte-formira-18-ot-bvp-prez-2020-godina-162019/> (seen on 20.04.2021)

production. The definition in a narrower sense describes tourism as a set of phenomena, people, relationships and interactions resulting from the change of location and stay of travelers.

Different forms of tourism can be defined by different criteria, with the motives for the stay and its organization by the travelers in the foreground. They can be the most diverse and, in general, characterize tourism as a leisure-oriented activity. The term "sport" comes from the old French word "desporter", which means "have fun". More famous, however, is the English word "sport" meaning physical exercises and games with a competitive nature and the pursuit of excellence and victory. The growing popularity of the sport nowadays makes its competitive nature optional. The Council of Europe (1992) defines sport as "all forms of physical activity which, through organized or unorganized participation, aim at improving physical condition and mental comfort by forming social contacts or obtaining results at all levels". However, this definition does not distinguish between professional and non-professional, as well as competitive from non-competitive sports.

The most widely accepted definition of the term "tourism" is *"a social, cultural and economic phenomenon which entails the movement of people to countries or places outside their usual environment for personal or business/professional purposes."*²

Based on the definitions of these concepts, their connection can be sought and the concept of "sports tourism" can be defined. In the specialized literature it is found relatively recently (late twentieth century). In our country, sports tourism is almost not considered, but it is the subject of attention of a number of foreign authors. In 2001 WTO and IOC define the reasons for the growing interest in sports tourism, namely:

- expansion and democratization of sports participants;
- increased interest in health and fitness since the 70's;
- increased active activities during the holidays from the 80's;
- increased interest to sports games and sporting events and increasing tourist opportunities related to them.

According to Stamov and Aleksieva (2003), sports tourism is "a type of specialized tourism in which the needs of tourists for sports, recreation and active recreation are met through their participation in various sports events"³. In order for a tourist trip to be defined as sports tourism, it must meet the following basic principles:

1. The practice of sports activities is a goal of the tourist trip;
2. Tourists are active participants in sports.

Sports tourism is born on the one hand as a continuation of sports and sports entertainment, and on the other hand as a need for the development of new additional services and products in the field of tourism. This connection has a strong stimulating effect on both tourism and sports. At the same time, theory and practice are faced with the question of whether sports tourism is a sufficiently specific product that can be separated from sports and tourism. If it is a distinctive and unique product, it is necessary to apply a specific management approach to its development.

Although sports tourism has a history of many thousands, its diversification and modern lifestyle trends in developed countries are making it an increasingly widespread phenomenon. From a historical point of view, the connection between sports and tourism dates back to ancient times together with the organization of the first sports competitions. The cult of sports and entertainment in ancient times reached its peak in the 8th century BC. in the Greek city-states. Of the four panel games, the most famous are those held in the Olympia region. During the Olympic Games, the number of athletes, spectators and traders ranged between 40 and 60 thousand people. The Olympic Games bring together people from all lands inhabited by Hellenic tribes, including southern Italy and Antalya.

3 Stamov, Stamen and Й. Алексиева (2006) Специализирани видове туризъм „Кота“. Stamov, Stamen and Y. Alexieva (2006) Specializirani vidove turizam. "Kota" p.89

The Romans continued the practice of traveling to participate in or observe sporting events, albeit in various forms. The need for sports is determined by health and social reasons, as the competitive element is no longer so important, which to some extent limits the movement of significant flows of people between the cities and areas of the Roman Empire. Gladiator fights and carriage races are gradually displacing athletes from the ancient Olympics and are spectacular events that are usually attended by spectators from the same city or the surrounding area. The Romans contributed to the development of sports tourism in terms of preserving the tradition of ball games, which are the basis of many of the most popular modern sports such as football, rugby, volleyball, softball. The tendency of the wealthy Romans to travel helped to spread the ideology of games throughout Europe as a means of keeping the mind and body in good shape. The relationship between sport and tourism expanded during the Middle Ages, when wealthy people traveled to watch competitions. The most popular sporting events then were the so-called tournaments, in which knights compete in several sports.

Later, with the development of the transport system, travel time was shortened and tours began to include increasingly distant destinations in Asia and Africa. Although sport is not the main motive at the beginning of the big tours, it becomes an important part of the experience in the later stages. This is because the initial tourists are rich young people for whom the main goal is education. However, the value system gradually changed and in the 17th century social skills came to the fore, including training the body through cycling and fencing exercises. The main obstacle to the development of sports tourism before the industrial revolution in the 19th century was the poorly developed transport infrastructure. After the 16th century, the situation gradually improved, especially in Britain, where new roads and improved carriages were built. For the return of the highly competitive element in the sport inherent in the ancient Greeks, the emergence of professionalism is of great importance, which from the very beginning provoked fierce debates in society. However, another element is needed for the development of commercial and professional sports in the era of industrialization, and that is the emergence of a critical mass of spectators.

However, the real flourishing of mass sports tourism can be said only in the 20th century, when the increase in leisure time allowed a significant mass of people to travel to play sports or watch sports competitions. The development of transport infrastructure is another powerful factor for the development of sports tourism. While the 19th century is the age of the train, the 20th century is the age of the car and the plane. The latter two modes of transport give a revolutionary impetus to the ability of people to travel to observe or participate in sports competitions and activities. The construction of quality and affordable hotels is also a prerequisite for the development of tourism and in particular sports tourism.

In the 1920s, more than 1,160 competitions were organized annually. The most popular tournaments are in northern France. They bring together athletes and spectators from the then kingdoms of Germany, England, Scotland and Iberia. With the improvement of transport after the 16th century, the opportunities for the development of tourism in general and sports tourism in particular increased. One of the most modern phenomena in tourism, which finds a wide echo in the literature of that time, is the so-called Great Tour. In the 18th century, wealthy English young people, after completing their higher education and before starting their careers, made a long tour of Europe. Due to the still weak transport infrastructure, the time to tour Europe is about a year.

3. Sports tourism in the 21st century - status and trends

3.1 Factors for the development of tourism

Since the beginning of the 21st century, tourism has been ranked among the fastest growing industries in the world, not only as a volume of markets, revenues and profits, but also as the introduction of new forms of supply and demand. The EU does not have a comprehensive tourism strategy, but a number of policies (climate and environmental protection, rural development, regional economic and social cohesion policy) have a major impact on the development of the tourism sector. At the beginning of 1980s, the European Commission recognized the role of tourism in the European economy, and in 1999 four working groups were set up on tourism-related issues dealing with the types of tourism, the quality of the tourism product, including and the diversification of traditional destinations, the protection of the environment in popular resorts, there is also talk of sustainable

tourism development, which affects rural areas and involves the active participation of the local population. In addition to the Union's targeted policies, a number of objective factors are also changing the tourist sector to a “restructuring” of the forms, destinations and types of services.

First of all, easy accessibility (open borders, improvement of all modes of transport, especially low-cost flights) increases the volume of tourist activities. New tourist products are constantly being created, new and unknown places to visit are offered, the emphasis shifts not only to the traditional quality - accommodation and service, but also to the cognitive or emotional experience of the trip.

Secondly, group distribution through tour operators and prepayment lowers the prices of mass holiday tourism, which in turn leads to the fact that the tourist supply begins to exceed the tourist demand. Prices remain a decisive factor, but new consumer requirements are added to them - more activity (accompanying packages for sports, entertainment, tours, training), more impressions (exotic destinations, experiences related to local culture), a requirement for locations that do not are overcrowded and have preserved nature.

A third important factor is the new communication channels and the openness of the information, which stimulate changes in advertising and marketing strategies - the sharing of personal impressions and the rating created by users in specialized platforms become decisive for the preferences of tourists, regardless of accommodation , cities or whole countries.

Another factor that changes the tourist demand is the increase of free time and the increase of the income, which leads to an increase of the time spent for travel and vacations, at the same time shortening the stay - ie. more holidays per year, but in fewer days, the share of "weekend" tourism increases by no more than two nights.

Last but not least, the change in consumer thinking should be noted - towards a more individual and more responsible attitude to one's own health and the environment. All this, in turn, leads to the transformation of the tourist market into a highly dynamic and fully consumer-oriented. According to some definitions, tourism and especially its alternative forms are being transformed from a "service economy" to an "experience economy" sector and necessitating a 'restructuring' of the forms, destinations and types of services.

That is why the profile of the Bulgarian tourists, presented in the Strategy for sustainable development of tourism in Bulgaria, horizon 2030, is interesting. The most characteristic for them is that they are:

- tourists of working age, seeking rest and recovery;
- families and groups (families and friends) seeking security and quality assurance;
- tourists with their own experience, looking for a good value for money;
- tourists traveling outside the active seasons - weekends and holidays;
- tourists traveling with a short stay, but more often all year round;
- actively looking for tourists, flexible in their choice and with their own opinion, organizing their trip themselves and willing to combine several types of tourism;
- emotionally connected with Bulgaria tourists (Bulgarians living abroad), appreciating the offer of cultural and historical landmarks;
- tourists with higher educational qualifications and intellectual level, seeking to meet additional needs and with the need for additional products in different types of tourism;
- people related to nature and ecological way of life, with requirements for the appropriate use of natural resources and the use of sustainable tourism;
- people active in the global network and using electronic services, new technologies (mobile);

- plowing with own property or holidaymakers with relatives, willing to combine travel for "rural tourism" with another specialized type of tourism (mountain, eco, cultural, spa, hunting and fishing).

3.2. Forms of sports tourism

Bulgaria has an international image of a host country and a symbol of sports fame and achievements. This naturally creates incentives for the development of Bulgarian tourism in integration with physical culture and sports. The typical forms and varieties of sports tourism, both around the world and in our country, are the trips of athletes, incl. amateurs (active sports tourism) and trips to observe sports events (passive sports tourism). Bulgaria has favorable conditions for the development of this type of tourism. In recent years, a significant part of the sports base has been renovated, new modern facilities have been built. Golf tourism can be considered as part of the sports tourism product of Bulgaria, as there are already several modern and luxurious courses in different parts of the country, including the coast.

Cycling is becoming more common as a tourist product in Europe. The advantages of this type of tourism are that it significantly reduces emissions from transport to travel to the destination, and in long-distance cycling they are completely eliminated. Bicycle tourism is developing in two directions. More widespread in our country is mountain biking, which can be considered part of adventure tourism. Apart from being a summer substitute for ski tourism in mountain resorts, mountain biking routes exist in all higher mountains in our country. There is already a significant cycling community, which performs a number of activities on a voluntary basis, which should be within the competence of various state institutions. The other direction of cycling tourism is the long bicycle routes and sightseeing tours. There is potential for such routes in Bulgaria, due to the presence of several long river systems, around which they usually navigate. The weak development of this direction is caused by the fact that the requirements for the road infrastructure must be approved by the state. However, it should not be considered that for such routes it is necessary to build a bike path. Experience at European level shows that a number of adaptation measures are applicable to the development of high-quality routes with minimal public investment and a short payback period in the form of revenue in the local economy.

Hunting tourism is also part of the sports tourism product of Bulgaria. The geographical location, the relief, the climate, the water resources and the other natural conditions are prerequisites, which determine the presence of extremely rich and diverse flora and fauna, of preserved wild nature and impressive with their beauty and strength game populations. The hunting fund of Bulgaria amounts to over 10 million ha, the hunting farms are 40. For the needs of the hunting activity 68 bases for intensive breeding, resettlement and use of fallow deer, mouflon and wild boar and 15 farms for production of hunting birds have been built, of which 9 for the production of pheasants and 5 for the production of semi - wild ducks. Bulgaria's fish wealth is also large and diverse. Apart from the Black Sea coast, fishing sites are also the large dams Iskar, Belmeken, Golyam Beglik, Shiroka Polyana, Dospat, Batak, Vacha, Rabisha, Bakar Dere, Karadja Dere. River fishing is accessible on the waters of Kamchia, Tundzha, Ropotamo, Veleka and their tributaries, which attract amateurs and professionals and less on the Danube. In general, the good prerequisites for the development of hunting tourism are the built specialized infrastructure - convenient roads, good communication, off-road vehicles, hunting facilities hunting residences, homes and chalets. The practice of hunting tourism in Bulgaria is under strict control, which contributes to the conservation of biodiversity.

In addition to the already mentioned factors that have a positive impact on the development of sports tourism in the 21st century, some more difficult to detect but significant elements are of great importance, namely:

- The growing importance of democratization at the expense of elitism in society;
- The transformation of sports and travel into an important element of the modern value system. The mass penetration of television into the homes of ordinary people, for example, is a phenomenon typical of the 21st century.

Television is a global business, and sport is one of the activities that can be turned into a commodity and sold to a wider audience. Corporate business plays a key role in the development of sports

tourism. This business invests in the sport product by creating clothing, sneakers, souvenirs and other goods, enhancing the pleasant experiences of tourists who, by dressing in a certain way, declare their sense of belonging.

Despite the main role of private capital in the development of sports tourism, governments also do not remain indifferent. Many activities and sectors, including tourism, are supported by government organizations because of their importance in the gross domestic product, employment and sustainable development of local communities. The fact that sports tourism, and especially the holding of major sporting events, can attract large groups of tourists has forced many governments in the last few years to conduct targeted and costly advertising campaigns to win the right to host such competitions.

Fig. 1 Forecast Gross value added in tourism until 2020

Source: World tourism organization

Sports tourism is at the heart of this dynamic, as it is the fastest growing type of tourism. In 2008, it generated about \$ 600 million or about 10% of the tourism market. In some countries, sports tourism reaches between 25% and 32% of this market. It is projected to create a gross value added of about \$ 1.6 billion in sports tourism by 2020 (Fig. 1)

We must immediately acknowledge that the COVID 19 pandemic has hit tourism hard in the world. According to the United Nations World Tourism Organization, international tourism in the first 10 months of 2020 fell by 72%, international travel was 900 million less, and levels returned to those of 1990. Losses so far are estimated at 935 billion dollars, and hundreds of millions lost their income.⁴

There are a number of publications in the scientific literature that aim to define the concept of sports tourism, distinguishing it from the concepts of tourism and sports. The fact of the relocation of large groups of people who participate in or observe sports competitions characterizes one of the possible relationships between sport and the provision of tourist services. Playing sports during your stay in holiday centers is another example of this relationship.

Last but not least, the connection between sports and tourism is manifested when visiting cultural centers related to sports - museums, monuments, ancient remains, sports facilities and towns, where already known international competitions have been held.

The diversity and difficulties in defining sports tourism stem largely from the lack of uniform definitions of the two constituent elements: sport and tourism.

4 Available at: https://www.capital.bg/biznes/turizum/2020/12/24/4156543_ubi_li_covid-19_svruchturizma/
(seen on 20.04.2021)

In the field of sport, for example, there are numerous and conflicting opinions about the scope of the concept itself. Some are adherents of historical content and tradition, while others offer a much wider scope. Another reason for the different definitions of sport are the specific features of the historical development of sports. Many modern sports have been practiced since antiquity, but only later, in the industrial age, are formed in their current form - with strict rules and regulations. Last but not least, the differences in the definitions of the term sport arise from the context in which the sport activity is performed. For example, according to some authors, "sport covers activities related to participation in competitions, active physical activity and / or the acquisition of physical skills in compliance with certain rules"⁵. However, there are also activities that do not fall within this scope, despite the fact that they involve physical effort. Unorganized swimming, running, walking are typical examples of mass sports. There is no unity in the definitions of the term tourism. They all contain travel and moving away from their usual place of residence or work as a necessary element, but differ in other characteristics and scope. The journey of the individual may not be tourism, but it is a necessary condition to talk about tourism.

The authors, who view tourism primarily as an economic activity, emphasize that it is "a study of the supply and demand of shelter and other ancillary services for those outside their place of residence, as well as the corresponding ways of spending, income and employment of those who provide the services"⁶. In the same context, Hay notes that tourism is "a process of redistribution of economic resources from the sending country to the host country, in which people travel for leisure."⁷

A second group of authors define tourism in terms of motivation to travel: whether it is professional or to meet their own needs. This discussion is directly related to sports tourism.

Third type definitions have a more pronounced technical character. This is the definition of the World Tourism Organization, according to which "tourism is a social, cultural and economic phenomenon that encompasses the travel of people to countries and places outside their usual environment for personal or business purposes. These people are called visitors and tourism is related to their activities, some of which require the realization of tourist costs."⁸

This definition is important because it is not only given by a representative international body, but also allows for the harmonization of statistics in different countries.

These definitions of sport and tourism show that these are two sectors between which there is a mutual connection and influence. Both sectors are related to human relations and include certain activities. Just as the development of tourism has a favorable effect on the development of sports, so sport in many cases stimulates the further development of tourism. The development of both tourism and sports is related to leisure. However, the driving motives of demand are different: tourism is based on the need for movement, rest and entertainment, and sport, although in a broader sense encompasses the elements of entertainment, is driven primarily by the desire to compete and achieve certain results.

The definitions of sports tourism can be grouped into several large groups depending on:

- Motives for travel;
- Product features and
- The type of perception.

⁷ B. Hay, *Leisure day trips: the new tourism*; *Tourism for leisure*, Eastbourne, D.Boterill, 1989.

⁸ World trade organization, *Understanding tourism: Basic glossary*

According to most researchers, there are the following types of sports tourism:

- *Sporadic sports tourism*. Exercise is short-lived and casual, which is why some authors suggest the term "tourist sport" instead of sports tourism. This could be, for example, attending a competition during the holidays. Sporadic tourism has little direct economic impact on tourism, but can add value to the proposed overall tourism package.

- *Nostalgic tourism*. It is associated with visits to museums, stadiums, halls for various sports and is essential especially for domestic day tourism. In addition, it has a positive effect on the branding of the destination and the fuller use of the built facilities.

- *Sports tourism related to observation*. It is most interesting for companies in the tourism business because it is the most popular and is associated with a wide coverage of the event in the media. Analyzes show that in addition to attracting many tourists, the organization of mega-events in the field of sports has a number of other social and political consequences.

- *Tourism related to sports*. It has the greatest emphasis on sports. It is the most diverse type in terms of composition, age, lifestyle, the desire to practice individual or collective sports.

In our opinion, the most full definition of "sports tourism" is: **any trip outside the place of permanent residence, for the purpose of active participation or practice of sports, regardless of the level of professionalism.**

Tourism, on the other hand, is one of the most popular forms of human entertainment, travel is a way to realize dreams. Although there are various motives for travel, the most common of them is moving away from everyday life and stress.

Sports tourism is a business that explores consumer motives related to sports and creates a special package of services and products for potential consumers. For many travel companies, different sports provide an opportunity to develop and offer new tourism products. Of particular importance in this regard are the mega-events such as the Olympic Games, World Championships and major international tournaments, which are at the heart of the tourist products offered.

4. CONCLUSION

The significance of sports tourism can be indicated in several aspects:

- The sports tourism helps activating peoples' lifestyle completely or at least during leave. It is associated with the proven positive effect of physical activities on the overall condition of the human body because it helps reducing stress and the incidence of diseases for increase life expectancy. In physical exercises in the brain produces endorphins that contribute to good mood. It has been proven that practicing sports reduces the risk of various diseases (eg cardiovascular, etc.) known as "diseases of civilization." Sport is part of the healthy way of a life that more and more people are turning to it.
- The supply of tourist services becomes enriched. This helps to distribute more evenly of tourists, both territorially and temporally.
- The sports tourism helps to attract additional tourism contingent, as well as to increase the length of stay of tourists. The supply of sports activities significantly increases the attractiveness and competitiveness of the respective destination. Sports tourism contributes to the development of the destination in accordance with the principles of sustainability.

Biological Plant Protection In Peppers (*Capsicum Annuum* L.)

Kitti Simon¹

Viktor József Vojnich²

¹ University of Szeged, Faculty of Agriculture, skitti1121@gmail.com, ORCID: 0000-0001-9422-2736

² University of Szeged, Faculty of Agriculture, vojnich.viktor@mgk.u-szeged.hu, ORCID: 0000-0002-7501-4920

Abstract: The aim of the study was to determine the effectiveness of regularly applied biological control by continuous monitoring of pests with the help of color traps (sticky sheets) with joint species identification of the useful insects to determine the extent to which native useful insects can settle next to the introduced predatory ones. The experiment was carried out in Szentes, in Hungary. The peppers in protected cultivation were grown in two unheated polytunnels (2x300 m² area). The color traps were laid out in three different places (at the beginning, in the middle, and at the end) in polytunnels. A total of 9x3 color traps were collected from the experimental area. The dates were in 2020: May 3, May 22, June 5, June 17, July 1, July 15, August 3, August 24, and September 10. During the experimental period (from May till September), the main pests damaging peppers were western flower thrips (*Frankliniella occidentalis*) and tobacco thrips (*Thrips tabaci*). The highest thrips number (*T. tabaci*, 125 pieces) was counted on 1st July in 2020. Useful insects in the experiment: predatory mites (*Amblyseius* spp.), predatory flower bugs (*Orius laevigatus*) and the banded thrips (*Aeolothrips intermedius*). The highest useful insect's number (*A. intermedius*, 9 pieces) was counted in the 17th June in 2020. From the color traps that we collected 9 times, it can be concluded that the number of *T. tabaci* individuals ranged from 8 to 30 for color traps 1, 2, and 3. At the collection of color traps 4 and 6, 92 to 125 tobacco thrips were detected. In the case of collected color traps number 7 through 9., the highest value of *T. tabaci* varied between 39 and 14 pieces, showing an decreasing trend. For the first three color traps collected, most *Frankliniella occidentalis* data ranged 10 pieces, showing a decreasing trend. In the collected color traps numbered 4, 6, and 7 the western flower thrips showed a value between 25 and 32 pieces. At the collection of color traps 5 was the highest, 87 pieces. In the case of collected color traps 8-9., *F. occidentalis* ranged 11 pieces, showing a decreasing trend. For the third color traps collected, the number of *Aeolothrips intermedius* was the lowest, namely 0. For the collected color traps 1-2 through 5-9, values between 1 and 6 were calculated for the banded thrips. In the case of collected color traps 4, the highest *A. intermedius* value varied 9 pieces.

Keywords: sweet pepper (*Capsicum annuum*), biological plant protection, *Frankliniella occidentalis* (western flower thrips), *Aeolothrips intermedius* (banded thrips), *Thrips tabaci* (tobacco thrips).

1. INTRODUCTION

Pepper (*Capsicum annuum* L.) is one of the most popular vegetable plants, it is of great nutritional importance and its popularity is growing worldwide. Consumption in fresh and processed form is significant on the one hand for its pleasant taste and on the other hand due to its high vitamin C content. With an annual production of 180-200 thousand tons, Hungary is one of the most important pepper-growing countries in the European Union. About 80% of the quantity of Hungarian peppers currently comes from protected cultivation. Its peculiarity is that more than 20 types are grown, 50-55% of the greenhouse surface is provided by the so-called Cecei types. This is the only forced vegetable species that is grown predominantly with Hungarian varieties, which can compete with foreign varieties in terms of quality and disease resistance. Soilless protected cultivation introduced in the 1990s provided an opportunity for long-term cultivation, with which the average yield of cone-shaped varieties reaches 25 kg / m² / year (Zatykó, 1993; Terbe and Slezák, 2019).

Peppers are very sensitive to precise control of heating, the minimum equipment required for cultivation is the heating and ventilation system. In unheated houses, only summer cultivation is possible, as it is sensitive to low temperatures, which cause a high degree of flower dropping and crop deformation. From the point of view of cultivation and climate control, large-air equipment is suitable in which, in cold weather during ventilation, the cold air does not come into direct contact with the plants. In summer, however, the upper leaves are not exposed to strong radiation. The planting requires a support system height of at least 2.5-3 m (Szöriné, 2007).

In the case of cultivation without soil, it is particularly important to observe optimal conditions in the root zone. For pepper production, the capacity of the irrigation system is 1-2 l / hour / drip, and the annual water demand is 800-900 l / m² / year. The transpiration water requirement of the adult plant

is 1.6-2.6 ml / m² at 1 J / cm² and the dosage is 2.0-3.5 ml / m² per Joule. Peppers do not tolerate airless, aqueous media, high salinity and the accumulation of certain harmful elements in the root zone. In case of poor water quality, desalination of water is recommended. Humidity control in summer is greatly facilitated by a humidification system that also performs cooling functions (Resh, 1998; Terbe et al., 2004; Terbe and Slezák, 2019).

Peppers are very demanding of the medium. It does not inhibit its development if it has the following characteristics:

- air capacity: 35-40% by volume
- water capacity: 45-50% by volume
- pore volume: 75-85% by volume.

For soil-less cultivation, stone wool, perlite and very good quality coconut husks are best.

In Hungary, two types of cultivation methods can be used:

❖ long-term cultivation (8-11 months in the cultivation equipment)

❖ short-term cultivation (4-6 months in the cultivation equipment)

One of the major issues in plant protection of peppers in protected cultivation is the solution of thrips control. The introduction of non-native predatory mites (*Amblyseius spp.*) and predatory flowering bugs (*Orius laevigatus*), which are commercially available in Hungary, offers a more efficient option than the use of pesticides. In addition to efficiency, biological control has a number of beneficial properties, one of the outstanding factors being that the abandonment of insecticides allows the settlement of native arthropods into shoots.

Settling animals from the paprika grower's point of view may be:

- useful: predators
- pests: animals feeding on peppers
- neutral: they do not feed on peppers or pepper pests

Of the "useful" group, native flower bugs are of outstanding importance, which, like *Orius laevigatus*, are able to regulate the number of thrips. They can eat 4-5 adults or 8-15 larvae a day. In addition to thrips, they can also feed on aphids, mites, moths or butterfly eggs. The largest number of specimens has the common flowering bug (*Orius niger*), which is common on flowering plants that provide it with prey, such as cultivated (e.g. alfalfa, corn, sunflower) or roadside plants (e.g. spotted burrs, nettles) in the vicinity of polytunnels from where it can migrate into the protected cultivation area. The first specimen can be observed as early as the end of May, but they do not grow en masse in peppers until June, where they are found continuously until the end of September.

Also, a common predatory species found in forced peppers is the banded thrips (*Aeolothrips intermedius*), which feeds mainly on phytophagous thrips and mites. It can eat 2-3 western flower thrips (*Frankliniella occidentalis*) or tobacco thrips (*Thrips tabaci*) larvae per day, while during its full development it can prey on up to 100 thrips or 300 spider mite larvae.

Western flower thrips (*F. occidentalis*) can reproduce both sexually and by parthenogenesis (Avar and Déri, 1989; Jenser, 1998). Females use their egg tubes to lay 20-40 eggs under the epidermis of the plants. The most ideal laying place for them is the flower. The first stage larva is still moving freely on the plant, the second stage larva is hiding. In forced peppers at 25 °C it takes 16 days for the pest to develop. It can achieve the highest reproduction in a flowering plant producing abundant pollen at a temperature of 20-21 °C and a relative humidity of 80-90% (Avar and Déri, 1989; Deligeorgidis et al., 2006a). The number of annual generations is 12-15.

The female of the tobacco thrips (*Thrips tabaci*), after 2-5 days of embryonic development, places 40-100 eggs under the epidermis of the plant and then takes 5 days for the larvae to develop. These larvae are later found in flowers, leaves, mostly on the back of the leaf, along the leaf veins, and in the leaf sheath or other hidden place. Interestingly, the duration of generation development is a function of temperature (Guzman et al., 1996; Bozsik, 1997; Jenser, 1998; Jenser, 2003; Deligeorgidis and

Ipsilandis, 2004; Jenser and Szénási, 2004; Arrieche et al., 2006; Deligeorgidis et al., 2006b). The higher the temperature, the shorter each stage will be: the time before laying; the chance of larvae surviving and laying their eggs decreases (Deligeorgidis et al., 2006b). Several generations can develop each year. In the open field, 4-5 generations and in the greenhouse up to 8-12 generations can develop in one year.

2. MATERIAL AND METHODS

The experiment was set up in Szentes (Csongrád-Csanád county), in Hungary. Pepper planting time was early April 2020. The peppers in protected cultivation were grown in two unheated polytunnels with areas of 300-300 m². In the experiment, *Kápia* type peppers were examined.

In the polytunnels, color traps were laid out in three different places: at the beginning of the (Figure 1.), in the middle of the, and at the end of the polytunnels. A total of 9 x 3 color traps were collected from the experimental area. The dates were: May 3, May 22, June 5, June 17, July 1, July 15, August 3, August 24, and September 10.

Figure 1: Visual inspection of the color trap

In addition to collecting color traps, we also collected pepper flower samples in protected cultivation. A total of three samples were taken, with dates of 8th June, 1st July, and 3rd August.

3. RESULTS

The color traps were placed a total of 9 times in the two polytunnels. The first polytunnel was the 1, the second polytunnel was the 2. The insects (thrips) collected by the color traps are shown in Figure 2. (*Frankliniella occidentalis*), Figure 3. (*Thrips tabaci*) and Figure 4. (*Aeolothrips intermedius*).

Figure 2: Show are the date of collection and the number of *Frankliniella occidentalis*.

Figure 3: Show are the date of collection and the number of *Thrips tabaci*.

Figure 4: Show are the date of collection and the number of *Aeolothrips intermedius*.

Pepper flower samples were collected during protected cultivation. A total of three samples were collected: 8th June, 1st July and 3rd August in 2020. The sampling was performed in 3 replicates and 2 samples.

- 1st pepper flower sampling (8th June, 2020): The time of recording was between 8:20 and 10:20. At the first survey, useful insects were not identified on the flower samples. Quantity of harmful insects: *F. occidentalis* 21 ind; *T. tabaci* 1 pc; *Myzus persicae* 3 pieces, and *Aphis fabae* 5 pcs.
- 2nd pepper flower sampling (1st July, 2020): The time of recording was between 13:30 and 15:30. At the second survey, only useful insect (*Orius niger*) was recorded after processing the collected flower samples. Quantity of harmful insects: *F. occidentalis* 42 pieces; *M. persicae* 1 pc, *T. tabaci* 2 pcs. Useful insect: *O. niger* 1 pc.
- 3rd pepper flower sampling (3rd August, 2020): The time of recording was between 14:00 and 16:00. At the third survey, a total of 3 useful insects were detected on the pepper flower samples: *O. niger* 3 pcs. Quantity of harmful insects: *F. occidentalis* 12 pieces.

4. CONCLUSIONS

During the experimental period (from May till September), the main pests damaging peppers were western flower thrips (*Frankliniella occidentalis*) and tobacco thrips (*Thrips tabaci*).

The highest thrips number (*T. tabaci*, 125 pieces) was counted on 1st July in 2020. Useful insects in the experiment: predatory mites (*Amblyseius spp.*), predatory flower bugs (*Orius laevigatus*) and the banded thrips (*Aeolothrips intermedius*).

The highest useful insect's number (*A. intermedius*, 9 pieces) was counted in the 17th June in 2020.

From the color traps that we collected 9 times, it can be concluded that the number of *T. tabaci* individuals ranged from 8 to 30 for color traps 1, 2, and 3. At the collection of color traps 4 and 6, 92 to 125 tobacco thrips were detected. In the case of collected color traps number 7 through 9., the highest value of *T. tabaci* varied between 39 and 14 pieces, showing an decreasing trend.

For the first three color traps collected, most *Frankliniella occidentalis* data ranged 10 pieces, showing a decreasing trend. In the collected color traps numbered 4, 6, and 7 the western flower thrips showed a value between 25 and 32 pieces. At the collection of color traps 5 was the highest, 87 pieces. In the case of collected color traps 8-9., *F. occidentalis* ranged 11 pieces, showing a decreasing trend.

For the third color traps collected, the number of *Aeolothrips intermedius* was the lowest, namely 0. For the collected color traps 1-2 through 5-9, values between 1 and 6 were calculated for the banded thrips. In the case of collected color traps 4, the highest *A. intermedius* value varied 9 pieces.

5. ACKNOWLEDGEMENTS

We would like to thank Norbert Varga, a pepper grower, for allowing us to carry out the experiment in his area. We would also like to thank János Gulyás, who helped us with our work and provided the area where the experiments were set up.

For A New Culture Of Responsibility And Its Insurance

Dr.Klaudia Lipi¹

¹Lecturer , “Fan Noli” University of Korca, Albania, Department of Finance-Accounting,
klaudialipi@yahoo.com

Abstract: Every human being being part of a certain society or community has rights and obligations. Since society operates and is regulated by certain moral and legal rules, every individual must abide by these rules. Violation of rights and non-fulfillment of obligations are key sources of potential future conflicts. If these conflicts cannot be resolved through compromise and understanding, the issue aggravates in litigation which are financially expensive and time consuming. So the individual is always responsible for his actions or inactions which by causing harm to another party, become a powerful cause of disagreement.

The best solution is the liability insurance policy, where among the main insurable responsibilities are civil, legal and moral responsibilities. All of these types are presented in detail in this study in terms of the cases covered by each of these insurance policies of the above liabilities, insurable sums, premiums, bonuses, exemptions and specific examples.

In this study is also treated in detail the current trend of liability insurance culture in Albania and then a comparative study was done with US countries on this issue.

For the realization of this paper are used secondary data from different sources specifically of the official websites of Insurance Companies in Albania, and in US countries.

At the end of the study I have concluded that if economic and cultural conditions in Albania improve, the number of insured people in Liability Insurance will increase.

Because if individuals have sufficient income, they will be more inclined towards investing in liability insurance policies.

Also by improving cultural conditions through educating the population on the profits that liability insurance will bring and raising public awareness on the importance of this insurance, the number of liability insured will increase significantly.

Keywords: responsibility, liability insurance policy, Insurance Companies in Albania, liability insurance culture.

1. INTRODUCTION

Liability insurance insures the buyer (also known as "insured") against losses due to liabilities that may arise from legal claims and lawsuits. Most liability insurance policies will determine what types of claims are covered and will cover policyholders from any liability that arises only if they are sued for the type of claim specified. Often the policy also makes the liability insurer responsible for protecting the insured when a claim arises.

Since insurance usually only covers claims made by a third party, liability insurance very rarely issues payments to the insured; usually, buyer liability insurance will pay directly to the third party making the claim. The third party may also have another type of insurance that covers losses incurred by the third party; in this case, third party insurance will collect payments from the first party liability insurance, on behalf of the third party.

Liability insurance started as a form of mutual agreement, where individuals or companies that shared a risk came together and raised funds that each single party could use in cases where they suffered losses due to a specific type of liability.

Over time, a system was developed to implement this type of insurance. Today's liability insurance system is based on dedicated carriers who offer purchasing liability insurance policies. These carriers are usually for-profit insurance companies.

In 1886, insurance companies in America began selling insurance policies for liability for personal injury accidents, primarily to cover business liability for employee accident accidents and non-employee injuries caused by their own business operations.

In 1896, major liability insurers agreed to adjust premium rates and share information on policyholders' losses. In 1906, these companies were dissolved.

Today, Liability Insurance is one of the most important types of insurance, which is offered by every insurance company in every country of the world.

2. MATERIAL AND METHODS

2.1 Purpose, Objectives, Methodology

The goals of the study are as below:

- Evidence of the meaning of the notion“Responsibility” and the forms it takes.
- Identification of insurable responsibilities.
- Study of the culture of liability insurance in Albania.
- Comparison of liability insurance culture in our country and in US countries.
- Drawing conclusions and giving suggestions.

The objectives that were set before the start of this task are:

- Get acquainted (gain, obtain) with present-day techniques that came from Responsible Liability,
- Identify the specific conditions of insurable liabilities,
- To study the culture of liability insurance in Albania,
- To compare the culture of liability insurance in our country and in US countries.

Methodology

For the realization of this study, have been used secondary methods of obtaining data from secondary sources, where for providing the theoretical framework, while for the comparative point of view, internet resources have been used, specifically of the official websites of Insurance Companies in Albania and USA or different scientific papers.

2.2. Liability Insurance

Society functions as a whole and a balance of mutual rights and obligations, where the freedom of one individual ends where the freedom of another begins. If in a public environment a right to an individual is violated or a non-fulfillment of an obligation to one or several individuals is created, then we are in the conditions of the birth of a responsibility.

The set of obligations that an individual, or a society, must maintain and abide by constitutes the universe of responsibility.

The members of a society are always found in the conditions of the obligation to respect the responsibility, which can be of several types.

2.2.1 Types of Responsibilities and Their Insurance¹

¹ Bundo, Sh, & Lito, G., (2014), Teoria dhe praktika e sigurimeve, Chap. 6,p.220-251

2.2.1.1 Moral responsibility

Moral responsibility and moral respect are strong norms of behavior and activity for the individual within a society / community. It has to do with the place of the individual in society, with the respect and values of society, with reciprocity and equality within individuals of the same community. Moral responsibility is the responsibility associated with the conscience of the individual. It directs the individual from the positive and implies / imposes a kind of psychological pressure on individuals who violate these moral norms of a certain community. This type of responsibility is different for different countries.

2.2.1.2 Legal responsibility The law constitutes the will of the majority raised to the level of obligation. It expresses the essence of what the individual is free to do, how he should act, and when his freedom is restricted. The moment an individual manifests a behavior that is contrary to the law, we are dealing with a violation of the law and Legal Liability.

The classification of the degree of legal violation is made by the Civil Code or the Criminal Code of a country. Violation of the law occurs in three forms:

a) Violation of the law as a wrongdoing - The case when an individual carries out activities to the detriment of an individual / society as a whole. The wrongdoer is obliged to compensate the damage he causes due to his wrongdoing activity.

b) Violation of the law as non-compliance / breach / breach of contract - Non-compliance with a stated responsibility, a liability taken, a related partnership. The incorrect party entered into a contract is also obliged to compensate the damage it causes to the other party. The guarantee for the execution of this responsibility is made by the state and state structures, which are the guarantors of the law.

c) Legal violation as a criminal activity- Flagrant violation with serious consequences on the party that suffers from the violation of the law. It also means extreme responsibility and extreme violation of the rights and freedoms of the individual. In these cases, the punishment is harsher. The forms of punishment in this case are: fines, seizure of property, deprivation of liberty of the responsible person, etc.

2.2.1.3 Civil liability Relates to the fact that every individual is exposed to the risk of individual liability. This risk is insurable risk. The amount insured in this new type of insurance is an amount previously fixed by the parties. This amount is in function of the coverage required by the insured and depends on whether the insured seeks to provide a liability or several liabilities.

Individual liability insurance appears in two forms: Insurance against a sum or insurance to cover and reimburse medical expenses.

The Individual Liability Cases covered are:

- Damages caused to someone's property / assets by the individual liability of the insured.
- Medical expenses or medical treatment for the person who is harmed by the individual liability of the insured.
- Moral damage (object of conflicts as a result of psychological damage or damage to one's image).

❖ *Damages that are treated and covered by a policy closer to the event and the risk are excluded. Example: Damage from motor vehicles, aircraft, sailing vehicles, etc.*

Meanwhile the persons who bear civil liability and who must be insured are:

- Individual- (imitator / adult who by his actions can become the cause of harm to someone),
- Head of household- (holds responsibility for the actions of his children),
- Animal keepers- (responsible for the damage that animals can cause),

- The tenant of an apartment / house / hotel- (responsible to the landlord for rent payments and maintenance of the rented building),
- The Owner of a residential house- (responsible for damages caused to others due to a defect in construction or due to lack of services),
- Individual exercising secondary activity- (responsible for damages arising from these activities),
- Person engaged in military service, civil defense, fire protection teams- (responsible for damages that occur due to their negligence),
- Employees in apartments - (Responsibility falls on employers / families who have employed these persons for potential damage to various buildings in their apartments),
- Persons who ride bicycles or other means of personal use, but not with motor vehicles- (children are covered by their parents' insurance policies and cyclists exercising their sport activity on the road of motor vehicles due to the non-existence of a special bike path, will have a limited treatment),
- Guardian or carrier of objects entrusted by others (bears direct responsibility and must be provided with security policies).

❖ *Exceptions to private civil liability insurance:*

- Damages caused by the insured himself,
- Damage caused by a family member when the whole family is covered by the same policy,
- Claims related to the main independent/ professional activity in which the insured is paid a regular salary,
- Damage caused to third parties due to the use of motor vehicles,
- Damage from the use of licensed aircraft/ equipment,
- Intentional damage to third parties,
- Damages caused by business activity,
- Damage due to communicable diseases,
- Damage from illegal activities.

In exchange for receiving the liability insurance policy, the individual must pay **PREMIUMS** (insurance price which are usually fixed, but discounts may also be applied as in cases where the individual is a regular periodic buyer or events that are subject to insurance have not occurred. The factors that affect the liability insurance premium are:

- Type of insurance (individual / family),
- Level of insured amount (very high, high premium),
- Franchise amount and level (low franchise, high premium),
- Coverage requirements (not all policyholders have the same need for coverage),

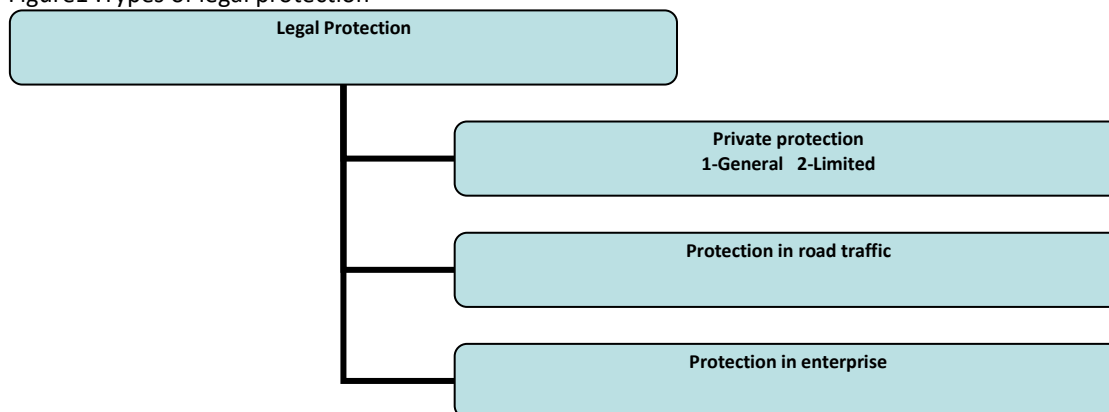

The premium discount can range from 10% to 15%. When several types of coverage are combined then preferential policy and coverage premiums are applied.

* Civil liability insurance is very important not to be exposed to major financial risks and losses. It relates to the mentality and culture of a country also as it is influenced by the perception that a certain society has about risk. Studies have shown that there is a strong correlation between accountability and the efficiency of the justice system.

* Civil liability can be not only individual, but also collective (the case of mansions, which may be subject to future damages, and therefore it is necessary to cover through liability insurance policy which will cover not only the owners, but also all individuals who have an active role in that palace).

2.2.1.4. Legal Responsibility - When the parties see their own interests and the situation is aggravated due to lack of understanding and compromise, we have a transition from civil liability to legal liability. The situation from real life where this fact is reflected is presented in: labor relations, family conflicts, conflicts with sellers, conflicts with the lessor, conflicts with the insurer, etc. Resolving a conflict is certainly a compromise, which can be reached by the relevant parties or through mediation. If no compromise is reached, then litigation will be needed which will increase costs in both time and money for both parties.

Figure1 :Types of legal protection

Source: Author, 2021

- ✓ **Private Legal Protection**-> The insurance policy guarantees the protection of the right to private interest in cases of court cases and disputes. Example: Patient Rights, Rental and Leasing, Labor Rights, Client Rights.

The sum insured has a certain limit, where in Europe it is mainly 250,000 Euros. The legal protection policy is ordinary insurance and covers the following costs: advice, media costs, attorneys' fees, expertise costs, court costs, the cost of various guarantees related to the object, prepayments or partial repayments.

- ✓ **Legal protection in road traffic**-> protects persons in road traffic on public roads, ie protection when someone harms them. Insured persons are: individuals, families or a third person living with the family but is a policy holder).

Provided: Vehicle Holder, Driver, Pedestrian, User of a public / private vehicle).

Facilities provided:

-Works of civil and public character (Conflicts due to road works and the rights of the person, the individual is

harmed by road works, noise, road accidents, etc.)

-The right of insurance (Conflicts over the object of the insurance contract, the insured has the impression that the insurer is not giving him the right that belongs to the casco police),

-Criminal law (Conflicts due to negligence / violation of traffic rules, not for damage suffered inside the car),

- Obtaining a patent (protection from procedures for obtaining a speed patent).

- ❖ **Exceptions:** All events in traffic that actually constitute a violation or contravention of traffic rules, but that do not cause harm.

Amount secured: All expenses are paid except fines.

- ✓ **Guaranteed protection, ownership, construction**-> Guarantee: owners of mansions and other buildings, protection from the collapse of mansions, protection of the owner from the elevator, damage to a car from the fall of a tree, cistern explosions, unexpected hazards causing harm etc.

Amount secured: All expenses are paid except fines.

- ✓ **Compulsory vehicle insurance**-> the obligation to purchase a compulsory vehicle insurance policy derives from the law in order for the injured person / persons to be compensated. Lawmakers do not allow anyone to bear the economic consequences of damages caused by a third party, in cases where he is unable to repay the damages. Emphasis: Motor vehicles such as: Cars (tourist cars, buses, vans, vans, trucks), motorcycles, electronic cars, solar powered cars, snowmobiles (construction machinery, tractors and other agricultural vehicles). There are no motor vehicles: bicycles, roller skates / iron bars, wheeled flats, trains, airplanes, helicopters, boats, yachts, motor boats.

Territorial space of car insurance (liability to third parties) ->Each country has its own laws, but the rules of coverage must be adapted so as not to impede the free movement of vehicles and people. For abroad, green cardboard is used. Car insurance in Albania has effects only within the Republic of Albania and not outside it.

Vehicles circulating without a license-> the cause may be technical, property, legal reasons, documentation, etc. Accidents caused by these vehicles are covered by a special national fund such as: Motor Bureau, Insurance policy for each vehicle, Premium depending on the value of the vehicle and insurance time, Premium for the whole or experienced driver, Premium for function of a past event.

- ❖ **Swiss franchise** (Up to 25 years old with a new license and no experience, 1000 francs; Up to 25 years old with up to 2 years experience with a driver's license, others 0 franchise francs)
- ❖ **The insurance premium** is detailed according to these elements:

Risk premium = total value of damage

Net premium = net risk premium + additional risk calculation

Gross premium = net premium + administrative expenses + profit-interest

Contracted premium = Gross prim +/- customer settings (age, experience, gender)

Billed premium = contracted premium-bonus + malus

- ❖ **Insurance premium and bonus-malus system**

Bonus (discount for the insured who has never registered an accident, For each year a symbolic discount is offered, For each level of discount below which no discount is applied, the insured who is a beneficiary of a bonus system benefits as if he had suffered damage. He accumulates his bonus right). Malus is in contrast the premium supplement, compared to the normal premium

- ✓ **Legal liability of the product**

The manufacturer of a product may cause harm to consumers (physical, mental or other losses) if he does not comply with the production standards.

Example: Restaurant and producer responsibility for people, manufacturers of electrical appliances, cosmetics, etc.

- ✓ **Legal responsibility of the Employer**

This includes liability for bodily injury (employee protected by insurance policies), Liability for occupational disease, Liability for loss of life / ability to work e.g. Drivers, aviators, builders, etc.

- ✓ **Legal responsibility of the profession**

This includes police officers to protect a liberal profession such as: pharmacist, surgeon, dentist, lawyer, consultant, engineer, chemist, etc.

3. INSURANCE MARKET DEVELOPMENTS AND THE CULTURE OF LIABILITY INSURANCE IN ALBANIA¹

This part of study represent the insurance market structure for period January-March 2021. As it shows, the major part of market is covered by non-life insurance and 13.83% of it is covered by life and health insurance.

So the liability insurance as a part of non-life insurance, occupies an important place in the insurance market.

Figure 2: The insurance market structure, January –March 2021

Source: FSA (Financial Supervisory Authority), 2021, <https://amf.gov.al/news.asp?id=32695&lng=1>.

Meanwhile the statistics presented by Financial Supervisor Authority (FSA, 2021), show the number of insurance contract, Gross written Insurance Premiums etc.

According to them Gross Written Insurance Premiums income during the period January-March 2021 amounted to over ALL 4,039 million, or 12.52% more compared to January-March 2020. In the period January-March 2021, the number of concluded insurance contracts reached 202,944 registering a decrease of 15.61% compared to January-March 2020.

The insurance market continued to be oriented towards non-life insurance, which brought 92.71% share of the total premium volume, leaving life insurance with 7.27% share of the total premium volume.

Seen from the market segmentation perspective by the following insurance types: compulsory and voluntary, the voluntary insurance written premiums account for 44.10% and compulsory insurance written premiums account for 55.90% of the total market..

In the period January-March 2021, gross paid claims in insurance market amounted to about ALL 2,083 million, or 8.27% more compared to January-March 2020.

During the period January-March 2021, gross paid claims in the motoric insurance reached the value of ALL 1,007 million, with an increase around 50.29% compared with the same period one year before.

3.1 Compulsory Motor Insurance

Compulsory Motor insurance Premiums during the period January-March 2021 amounted to about ALL 2,258 million or 8.36% more compared to January-March 2020.

¹ Albanian Financial Supervisory Authority (AFSA), (2021),

<https://amf.gov.al/news.asp?id=32695&lng=1>

Domestic MTPL Insurance Premiums registered an increase by 13.16% of the gross written premium volume in the period of January-March 2021. The number of contracts increased by 15.44% compared to January-March 2020.

Green Card Insurance Premiums registered a decrease by 20.38% of the gross written premium volume in the period of January-March 2021. The number of contracts decreased by 35.92% compared to January-March 2020.

Border Insurance Premiums registered an increase by 43.38% of the gross written premium volume in the period of January-March 2021 compared to January-March 2020. The number of contracts increased by 36.71%..

3.2 Voluntary Insurance

In the period January-March 2021, Voluntary Insurance Premiums amounted to about ALL 1,781 million, or 18.26% more compared to January-March 2020. The number of voluntary insurance contracts decreased by 37.83% compared to January - March 2020.

In this period, Voluntary Non -Life Insurance Premiums registered an increase by 19.9% compared to January-March 2020.

In the same period the Property, Liability and Guarantee portfolios provided over 969 million ALL income in total and the first place was occupied by Fire and Other Property Damages with about 71.2%, followed by General Liability insurance with 18.73% of the total income.

The insurance Against Fire and Natural Forces portfolio, In the period January-March 2021, registered an increase by 79.79% of gross written premium volume of this portfolio and an increase by 8.59% in the number of insurance contracts compared to January-March 2020.

Also Accident and Health Insurance income amounted to about ALL 265 million, marking a decrease of 8.5% compared to January-March 2020.

Finally in the period January-March 2021, Life insurance premiums amounted to about ALL 294 million, or 10.34% more compared January-March 2020.

3.3 Gross Paid Claims

In the period of January-March 2021 the payment of claims decreased by 8.27% compared to January-March 2020. The highest share of the gross paid claims belong insurance Motor Insurance with about AL 1,007 million, or 48.34% of the total gross paid claims.

Table 1: The average claims for the main motor insurance products.

Item	Values (in ALL 000)		Change
	2020	2021	(in %) 21 / 20-1 '
Average Claims			
Domestic MTPL	151	190	25.62
Green Card	565	1,282	127.06
Casco	109	124	13.19

Source:FSA(Financial Supervisory Authority),2021,

<https://amf.gov.al/news.asp?id=32695&lng=1>

4. IMPORTANT STATISTICS RELATED TO LIABILITY INSURANCE CULTURE IN US

The digital age has brought change and disruption to almost every aspect of the world we know. Car insurance statistics in the US show that even old-fashioned businesses are not immune. Since its

inception in 1930 when the UK was the first country in the world to make car insurance policies necessary, the car insurance industry has never faced the major

challenges and rapid evolution it faces today. Autonomous vehicles, car-sharing services, Internet-connected machines, and other evolving technologies are rapidly changing the game. With great challenges come great opportunities for those who want to adapt. Car insurance companies will be increasingly pushed to innovate in the next decade, or face a high risk of being left behind. To describe a clearer picture of the changing landscape of the automotive insurance industry, we have compiled this list of interesting and significant data points.

- Almost 87% of U.S. drivers have some type of car insurance.
- The nation's top 2019 insurance rate – recorded in Michigan – is \$2,611 per year.
- This year's average insurance price in Louisiana is \$2,190.
- The average car insurance rate in California is \$1,527.
- The minimum annual insurance cost in Wyoming is just \$485.
- The U.S. average automobile insurance premium is \$1,470 per year.
- The average national price for full coverage insurance is \$1,621.
- The average monthly car insurance installment payment is \$118.63.
- There are 32 million uninsured motorists in the U.S.
- About 26.7% of vehicles in Florida are uninsured.
- Only 4.5% of drivers from Maine don't have any kind of insurance policy.
- The car insurance market is growing at about 3.3 percent per year.

Figure 3: Growth of the Auto Insurance Industry(Gross written premiums in US dollar billions).

Source:<https://carsurance.net/insurance-statistics/>, 2020

4.1 Auto Insurance Industry Revenue growth

- Australian auto insurance industry generated revenue of \$21 billion in 2018.
- The automobile insurance industry is projected to generate revenue of \$285.2 billion in 2019.
- The U.S. auto insurance market grew by 1.2% in 2019.

- From 2014 to 2019, the U.S. auto insurance market grew by 3.3%.
- The global auto insurance market grew by 2.9% from 2010 to 2014, when it reached \$669.7 billion.

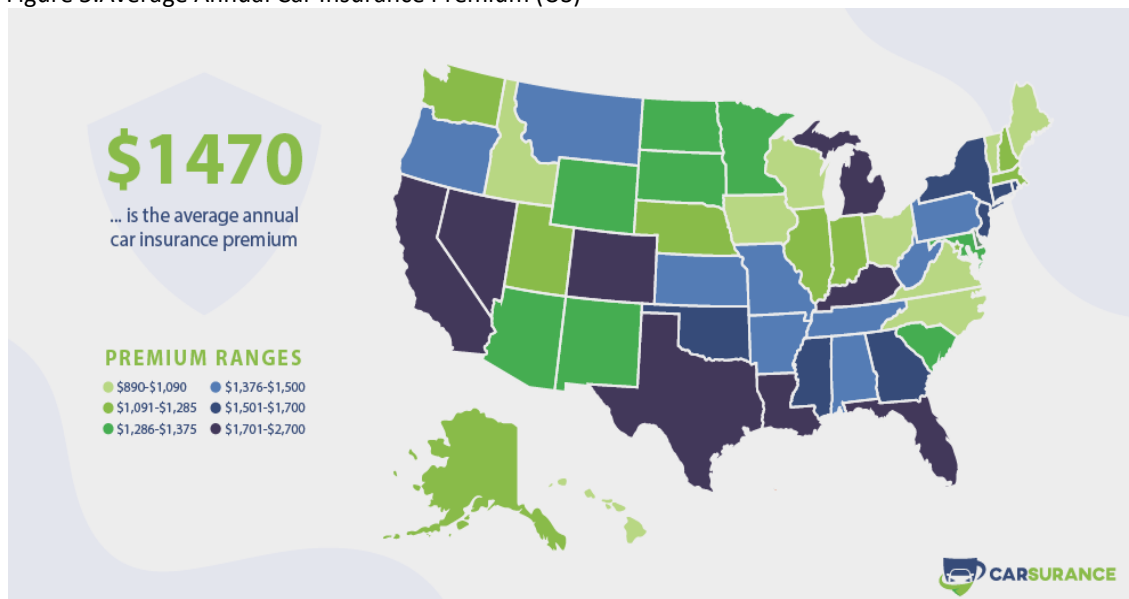

Figure 4: Value of premiums by motor vehicle insurance companies 2009-2019(In billions of US dollars)

Source: <https://carsurance.net/insurance-statistics/>, 2020

From this figure we note that from 2009 to 2019 there is a significant increase in the premium paid for motor insurance policies in America. So we are dealing with an increasing trend of demand for Non-Life insurance and specifically for Liability Insurance.

Figure 5. Average Annual Car Insurance Premium (US)

Source: <https://carsurance.net/insurance-statistics/>, 2020

In the figure above, we note that the average premium from Automobile Insurance in the US is \$ 1470, while the figure below shows, the total industry cost for this type of insurance is \$ 1457. So we are dealing with a positive balance, and profit of this industry,

Figure 6: Average Cost Of Automobile Insurance (Globally)

Figure 7: Growth of Car Insurance Premium

Source: <https://carsurance.net/insurance-statistics/>, 2020

Also in this figure 8, we notice that the income from vehicle insurance in the US in 2019 has increased by 23.12%. This means that we are dealing with a new culture of responsibility and this has an upward trend that brings income / rewards over the years, showing potential for good results in the future.

Figure 8: Car Insurance Market Share (US)

This figure shows in detail what share each category of society occupies in the total premiums received by the Insurance Industry for Vehicle Insurance.

Figure 9: Profit of the Largest Industries in the USA and the share of each of them in the Insurance Market

Source: <https://carsurance.net/insurance-statistics/>, 2020

The chart above shows the largest Insurance Industries in America and Profit and the share that each of them occupies in the Insurance Market. We see that State Farm occupies the highest percentage in the market and generates the highest revenue.

5. RESULTS AND DISCUSSION

5.1 Comparative perspective of liability insurance in our country and in US countries

Constant changes in the economic, social and cultural spheres have influenced the decision-making of individuals of societies of all countries of the world to ensure. A statistical study undertaken confirmed a strong correlation between economic and cultural factors and decision-making to purchase liability insurance policies. The effect of these factors is assessed as negative, especially in underdeveloped or developing countries. In these countries, the underdeveloped mentality and misinformation combined with low economic opportunities for each individual makes the tendency to buy liability insurance policies decrease. (Reza & Azadeh, 2015)

In line with current economic conditions, the 2020 Pandemic has negatively impacted the economic sector and the income of every individual by curbing their investment decision-making. These drastic changes have certainly affected the tendency of individuals to insure themselves by purchasing liability insurance policies. However, based on the data collected up to current years we note that: In Albania motor insurance for 2019-2020 occupies 63.61% and the motor insurance market increased by 30%, while in the US we have

an increase of 1.2%.

This is explained by the fact that the insurance market in the US has grown significantly in recent years and the growth trend is now stable, while in Albania this trend is "explosive" now as it is related to the very underdeveloped economic and cultural stage of Albania compared to America.

Also, the annual premiums, the profitability of insurance companies in America from liability insurance is many times higher than those in Albania. While in America there is a wide distribution of categories of society that buy liability insurance policies, in Albania only certain categories of individuals buy them (mainly individuals aware of the importance of these insurances, who own a vehicle and who have to sufficient income to cover the costs of purchasing the insurance policy).

Despite the growing trend towards Liability Insurance in our country, we are still very far from other countries in the world, and this is due to a number of obstacles. The dynamism of these factors in the future will determine what the potential trend will be. The only thing that is noticed is a contraction of individual investments and budgets due to the global pandemic, which puts in dilemma the performance of the insurance market in general and the profits of insurance companies from the sale of liability insurance policies.

5.2 Conclusions

1. Every individual living in a social group has his right and obligation, and ensures that the obligation not to infringe on another and to fulfill his obligations makes him to expose the Responsibility correctly.
2. Liability Insurance makes necessary to protect against abilities or injuries that may be caused by one person / group of persons over another person
3. The three insurable types of Liability are: Civil Liability, Legal, Moral, Legal / Legal Liability. Liability insurance also includes Vehicle Insurance.
4. In Albania there is a culture of Liability and its Insurance, after it has crushed the Insurance Market and Non-Life Insurance and specifically Motor Vehicle Insurance.
5. Revenues of Insurance Companies in Albania before the sale of motor vehicle insurance police for 2019-2020 have increased by 30%.
6. In the United States, field insurance is dominated by vehicle insurance and there is an increase of old centers by 1.2%

7. Cultural, economic and social factors play such a role in individuals' tendency to buy police and provide protection.
8. Despite the increase in the direction of Liability Insurance in our country, we are still much further away from others in the world, and it is if there is another obstacle to another factor.
9. The bottom line is an international investment investment and individual budget due to the global pandemic, which can be observed in the sun to provide security in general and benefit from providing police insurance for security.

5.3 Recommendations

1. Since we found that cultural and economic factors influence the decision-making of individuals to purchase liability insurance policies, the focus should fall on these factors.
2. As we have passed and are going through a difficult period of pandemics where the economic conditions in our country have deteriorated a lot, the emphasis should be on possible economic improvements, because if individuals will have sufficient income they will be more prone towards investing in liability insurance policies.
3. Economic improvement can come by informing the Albanian population about the economy of gigs, which enables individuals to generate significant income, working online and with a very flexible schedule. Training programs on how to work in this type of economy should also be provided.
4. Another method is to improve cultural conditions by educating the population on the benefits of liability insurance and raising public awareness of the importance of this insurance.
5. Although pandemic conditions are difficult and uncertain, opening the borders is a necessity, to avoid the colossal increase in prices due to the limited supply of goods, which our country imports from abroad. In this way, the excess expenses of individuals will be saved and their economic situation will be improved, showing an increasing tendency to be insured in Liability Insurance in the future.
6. So if economic and cultural conditions are improved, the number of insured in Liability Insurance will increase.

The Collective Memory of Albanians

Klementin Mile¹

¹PhD, klementin.mile@uet.edu.al

Abstract: This article aims at exploring the structures of the collective memory of Albanians during the last 100 years. To that purpose, the concept of ‘collective memory’, first developed by French sociologist Maurice Halbwachs, and then refined by other scholars in the twentieth century, will be conceptualised in the frame of equivalence functionalism, i.e. as a solution to a problem. Such strategy requires a point of reference for the problem, which we take it to be the Albanian elite’s problem of preserving and/or strengthening their powerful position. This reference problem focuses attention to the interaction between the Albanian elites and the masses, elucidating certain structural features that have influenced the workings of collective memory production. These workings will be shown both in terms of national collective memory and religious collective memory.

Introduction

Any major upheaval or change in a given cultural context opens a process of definition or redefinitions on perceptions of the past and its projection in the future. It opens a strong debate on how certain social groups define and redefine themselves. Collective memory as a concept, theorized and practiced, tries to construct and develop the sense of the past (Confino 1997). Halbwachs (Halbwachs 1950) defined collective memory as a process which is not confined in the intimate circle of the individual but rather in terms of exchange of views within a given social group. According to him social groups define a social space within which human activity is legitimized and reproduced. Assaman (1998) on the other end opens and widens the concept of memory introducing a twofold process: communicative memory and cultural memory. Both of them imply two distinct processes. The first refers to the usage of communication in everyday life, hence temporality while the later refers to the distance from everyday and as a benchmark of comparison between the past and the present. Each group might approach differently to the way by which it constructs the image of itself, given also the degree of the focus of collective memory (Beim 2007). The theory of collective memory in this paper will thus focus only certain aspects of it concerning mainly its manifestation in political identity. To this purpose the scheme proposed by Assaman fits in the general understanding of collective memory. As collective memory is a process communicated in the present taking in consideration the fixity of the past (Kanstainer 2002), the way it is presented offers us some constraints in the way of analysing it. As Niklas Luhmann put it, all systems ‘function as a unity ...but they are differentiated and none of them can represent the whole system’ (Luhman 1990). In the Luhmannian view what solves the dilemma is the idea of hierarchy by which differentiation is achieved. In terms of collective memory this poses the problem of defining how much or less the collective constitutes memory and which are the unit producing it, the society at large or the elite? To what extent is it true that the convergence of enunciative and institutional authority in the nation’s pedagogy (cor)responds to the intersection of the horizontal bond of living with the vertical bond of authority - a move that actualises the social(Ricoeur 2004: 60, 167)?

National memory

Nationalism is based upon a circular logic: it implies that the consequence of the nation will be the state as the only form of societal organization that completes the idea of the nation. Therefore, nationalism needs to explain or legitimize the existence of the national idea through some form of past identity, for which it needs to build symbolic (i.e. unifying) narratives of a common past. As mentioned before, many Albanian writers have employed an essentialist vision or image of the Albanian nation. Accordingly, they refer to past societal arrangements in the Albanian area as states. This concept is recurrent not only in Albanian literature but also among historians. They do so when they talk for example of Illyrian kingdoms of the third or second century B.C. It is also interesting that this is also recurrent in the discourse on nationalism and history in Kosovo, the ancient territories of which were inhabited by the Illyrian tribe of the Dardans. Often, Kosovo is regarded as the continuity of Dardania. History is thus

perceived in a very linear way, in a sort of fluid and continuous common experience, broken only by the incident of conquests or invasions from the others. In prospective, the Albanian nationalist discourse used the past to legitimize the future, independently of the vivid differences that existed with the other peer nationalist movements like the Greek or Serbian ones.

In this sense, Illyrian tribal kingdoms, the feudal principality of Skanderbeg or territories controlled by Ali Pasha of Ionanina, or the Bushatlli family, are all referred to as natural antecedents and precedents of the Albanian nation and its state. The nation was in this way perceived as immutable in time and space (Calhoun 1993:233). According to Calhoun, the claim for the transformation or the legitimization of the state –formation lies in well founded antecedents. Indeed, a whole body of literature in Albania is dedicated to evoking any kind of formal political entity that is linked with the present Albanian territory and culture, independently of the quality. Such discourse has followed and has been muted several times to adapt to the present reality. This is particularly evident in the first phase of state formation in Albania, where the myth of Skanderbeg and the principality of Arber, provided the sub-strata for national identification. The very figure and the ambivalence of Skanderbeg fitted almost perfectly the Albanian reality of the time.

A new state was thus formed, the only attachment of which regarding national identity, was the existence of the language which provided and still provides the cement of Albanian national identity. However, the absorption of externally produced shocks, such as the dissolution of the Ottoman Empire, aims to preserve the social terrain of the national community intact. This is made possible through the modification of collective self-presentations controlled by the centres of political power. Nation-states control the mechanism of anamnestic autopoiesis, a mechanism which allows for the creative reproduction of the cult of collective narcissism (Hohendahl 1995: 56-7). For Albanian elites, religion did not seem to matter much as long as Albanians were depicted as people perennially in war with the foreign invader. In fact, the very relation of the Albanian inhabited territory with the Ottoman Empire has been perceived as a mutual and self-oriented relation. Albanian elites were more at home in Istanbul than in Vlora, Berat or Scutari, but they still retained a certain degree of freedom action and movement. Egerem bej Vlora in his book '*Kujtime*' (Memories) (Vlora: 1973:2004) stresses strongly on this elastic relation with the Ottoman authorities which began to sever only after the *coup d'état* of Enver Bey in 1908. The "*beys*" of Albania retained a central feature embodied in the national Albanian identity, namely autonomy from central power. From the mountains of Mirdita to the plains of Myzeqe, the cities or coastal areas, people were eager not only to claim their nation but also to stress on autonomy and local government. Indeed, the concepts of autonomy and local government cannot be confused with other features of modernity which similar national movements were trying to achieve through emancipating from the Ottoman rule. The former were rather the reflection of growing animosity among Albanians for the missing promises and the reforms that sultan Abdulhamid II was undertaking.

Albania has often been depicted as a retrograde reality, at least in those years where "*peer*" states were fledging their muscles to get involved in major conflicts, such as the First World War. Nevertheless, they were still able to provide some minimal basis for state formation. To this account, we wish to cite, among others, Stephan Krasner (Krasner 2001:231). In his essay titled '*Abiding Sovereignty*', he tries to give an answer to the ever growing quest for the retreat of the nation state, *vis-à-vis* globalization. According to him, sovereignty is by definition weak and it leaves along other alternatives. This vision of sovereignty seems to fit the Albanian case in its short history up to the end of the Second World War. It never exceeded certain strength and it evolved slowly or even retracted in certain periods. Krasner defines these arrangements as '*neutral mutants*' when referring to the weaker state policies. The Albanian state has grown under the umbrella of international and bilateral arrangements in various phases of its life (Fisher:1984, Dervishi:2005, Puto:2009,) which in good or bad has provided some sort of division of '*labour*' between the national state and the international arena. In this sense, the inter-state arrangements provided the basis for maintaining an order which was reluctant to a sudden change. The rise of the Albanian nationalism was born out of the rejection of some aspects of modernity, like those related to the persistence of the strong and central state. In reverse, the national

discourse was related mainly to elements of national identity such as language and myths like the Illyrian ancestry or Skanderbeg and so on.

What is, in our opinion, very interesting in this period, refers to the nature of conflict that permeated the Albanian elites. The political class at that time was a mosaic of post-Ottoman elites, western-educated professionals and clerics of all extractions. The most common form of political conflict thus concentrated on the distribution of power and the affirmation of local peculiarities in a fragmented national arena. In short, state formation rather than an end in itself, it became an instrument, permeated by a quite high grade of differentiation in the concept of constructing strong institutions. This does not mean that the national idea was not reproduced and inducted through national institutions like schools and alike. During the very first years of the fall of communism, Albanian refugees fleeing to Western European countries came in contact with fellow Albanians from Kosovo. Most of them noted a certain pronounced tendency to display national symbols, flags, and so on. Many children of Kosovo Albanians bore names of cities of Albania which they actually never visited. This of course was part of the whole tragedy that accompanied Kosovo during the period from 1980 to 2000 (Poulton& Vickers 1998:155; Malcolm) and surely is one of the basis upon which the *Kosovar* identity is composed. While in mainland Albania most of the debate recurring on nationalism and national identity focuses on the relation among under-development, the communist legacy and religion, in Kosovo the debate evolves mostly around the possibility to reunite to Albania or stand alone (Spahiu 2012). The quest for unification to Albania is mainly muted officially by the arrangements that brought the independence of the region and the foreign factor as a guarantee for the recognition of independence (Perritt 2010).

On the other hand, some Kosovo intellectuals sustain somehow that there is enough ground to support talking of a Kosovar identity, distinct from the Albanian one. This identity, according to Matoshi, is based on *'a distinct political, geographical and historical unit that means, an identical constitutional-juridical order, which in fact means that there is a nation'* (in Bislimi 28.11.2011). In fact what Matoshi seems to suggest is that today's Kosovo is a by-product of a series of historical, economical or political events, which have eventually determined a sort of national conscience, different from the overall Albanian national identity. Matoshi therefore marks a clear division among Albania and Kosovo in terms of identity, not taking into consideration the common linguistic identity of the two states.

Of the same view is also N. Spahiu (Spahiu 2012) which uses mainly two presumptions: a) the very existence of the state determines the existence/ formation of the nation and national identity, and, b) the structure of a rural society based on a clan/ family as a structure in which the power is unconditionally delegated to the leader. As the first assumption (though difficult to understand even in terms of theoretical premises in the discourse of Spahiu) can be ultimately clarified as an equalization of state to the nation, the second one is somehow perplexing. It states in fact that Albanians *'choose their leaders till they die'*, and as they choose them, they choose even their political views. Spahiu's perspective is quite interesting if we consider the evolution and the organization of the pro-independence movement in Kosovo during the years 1991-2000, led by Ibrahim Rugova (Poulton& Vickers 1998). His leadership remained unchallenged, even when he lost ground to the forces that made direct reference to the war like the PDK of today's Prime Minister, Mr.HashimThaci. Indeed, Spahiu's reasoning offers a unique and quite original view of a way in which, somehow, a distinct Kosovar identity might sustain the Republic of Kosovo. Such thesis has been strongly rejected especially by the movement *Vetevendosja*, which is openly sustaining the formal inclusion of Kosovo in the Republic of Albania. As a matter of fact, what has marked the evolution of the Albanian or even the Kosovar national and political identities is strongly linked to the preposition for survival. During the independence of Albania, irredentism and the quest for Kosovo was kept fairly low, a tradition which continued even during the Zogu regime from 1924 to 1939 (Fisher). The same behavior was evidenced during the communist regime till 1980, when the student protests in Pristina received official support from Tirana (Malcolm 1998). The existence of two distinct, predominantly Albanian language and culture states still fuels the debate over the future of the area, although the debate on identity can rest mainly on two main shared premises, the common language and local autonomy or self-arrangements and a certain degree of resistance versus building or maintaining strong central institutions.

Religious collective memory

Attempts to produce consensual memory narratives primarily belong to centripetal institutions, such as the educational system, which ‘will turn out worthy, loyal and competent members of the total society’ (Gellner 1983: 64; Smith 1991: 16). However, before gaining independence in 1912, Albanians had to rely on other means for producing consensual memory narratives. They could and used the idea of religious tolerance. In general, the Albanian nationalist rhetoric has implicitly accepted the absence of the religious discourse and affiliation from the very beginning. They simply refer to religion in terms of tolerance, mainly to explain the formation and the survival of the national idea and state (Gjuraj 1999, Misha 2002) or they extrapolate the idea of nationalism out of the domain of spirituality and religiosity. The identification with religion is somehow supplanted by nationalism. The fight for the Albanian language sustained in the late 19th and early 20th century has also been considered in the same light and translated into religious tolerance. In this sense, today, the discourse of religious tolerance has become one of the main features of the Albanian national identity, even though tolerance is perceived not as a value intrinsically and positively linked with identity, but rather as a value which would have facilitated the position and the integration effort of Albania in the EU.

Religious tolerance in Albania still sticks to the idea of peaceful cohabitation among different groups, as “anxiously” emphasized by many commentators (Gjuraj 2012, Kruja 2012). Both, the head of the Bektashi Community, Mr. Edmond Brahimaj and the head of the Islamic Community in Tirana, Mr. Selim Muca, have emphasized religious tolerance quite strongly (Brahimaj 2012; Muca 2012). During the interviews conducted in January 2012 in Tirana, both clerics responded to demands on relations with other religions as extremely fair. Religious frictions in Albania have never produced levels of violence. The latter is a long and well preserved tradition, which was not only part of the general discourse, but rather a feature of the Ottoman Empire which let the religious communities settle their disputes among peers of the same religious group. To our opinion, religion in this sense has exhibited features of strong local identities rather than a common pattern of understanding. To put it simply, the degree of local autonomy was even more important than any religious identity. Clayer (Clayer: 2007) in her splendid work ‘The origins of Albanian nationalism’ reinforces the idea of religious identity as a locally based concept and not reflected out of the territory or group. When she explains the frictions between Catholics and Muslims in Shkodra, she specifies the particular environment in a particularly dense inhabited area where animosities were more linked to power rather than to the loyalty devoted to one religious element or another. The religious sentiment in the city is traditionally strong, producing probably some of the most educated clerics and the most vivid religious communities in Albania. This was confirmed during and after communism. Gjuraj (Gjuraj 2012) states that both communities suffered from persecution equally. Most of the clerics of both communities were arrested or executed and current religious practices by both members of respective communities were banned. The mufti of Scutari, Mr. Muhamed Sytari (2012), while stressing on mutual respect and tolerance, expressed his concern on some issues like the disapproval on mixed marriages. Scutari is probably a *sui generis* case in today’s Albania.

Elsewhere, in other mixed religious communities, problems seem to lie more on the organization of mosques or local communities rather than on the religious expression of faith (Quku 2012). The Islamic community in Albania seems to have undertaken a much lower profile, concentrating more on the administration of the religious duties and never entering the domain of politics. While it would be common, for instance, that the mayor of the municipality of Scutari (a catholic) showed himself in public with the mufti of the city, in Tirana, the Islamic community would most probably refrain from taking sides with the candidates, despite their promises for building a new mosque in the city.

The history of Islam and its development in Kosovo is also different from the Albanian one. By the time Albanian muftis and religious leaders decided to found a national Islamic Community in 1923, based on the territory of the Principality of Albania (Clayer 1998), Kosovo was part of the Kingdom of the Serbs, Croats and Slovenes. During the interwar years, the strong sense of religious belonging was seen as a way to maintain the national identity (Clayer 1998, Poulton 1998; Blumi 2000; Krasniqi 2010; Oktem

2010). While in the Principality of Albania, national identity was based more on language and the preservation of local arrangements, the manifestation of religious practices in Kosovo was seen as a way to manifest and preserve the Albanian national identity (Krasniqi 2010). In this regard, we can at least identify a different pattern of Islamic identity among Albanians in Kosovo, with a stronger public presence of religious assertion, due mainly to the specific social and political context of the region (Oktem 2011). Islam in Kosovo has been the predominant religious confession, thus forming the ground for maintaining a much stronger national identity religiously oriented without excluding the catholic or the *sufi* lodges scattered in the south of the country. Nevertheless many questions arise. Iseni maintains that (Iseni 2009) the new Kosovo administration has to come to terms with some religious tensions arising in the country on topics such as the use of the scarf for women and the like. The religious panorama in Kosovo has been heated even more by some public controversial appearances of the chief Mufti of Kosovo, namely NaimTernava. Together with some representatives of two Anatolian municipalities, he paid a visit to the *tyrbe* of Sultan Murat the first, the winner of the battle of Kosovo in 1389. During the event, the Mufti expressed his consideration on Sultan Murat considering him a martyr of faith (Kurtishi 2010). The event raised some concerns in the Albanian and Kosovo medias, considering the fact that the Albanian national hero, GjergjKastrioti Scanderbeg fought against the descendant of Murat sixty years later. The very place of the Battle of Kosovo, Obiliq, was later renamed Kastriot in honor of the Albanian National Hero. The fact in itself is a simple statement that gives another panorama of today's Islamic identity in Kosovo, probably much more religious-oriented than in Albania, but still retaining its distinctive national features. The statement of the Mufti and the place appear unique considering the fact that the Battle of Kosovo has long been considered as one of the landmarks of the Serbian identity. Assuming and considering the sultan as a martyr of faith, the Mufti has somehow asserted a religious identity which sounds more like a nationalistic manifesto rather than a religious one.

In Albania, the revision of the Organic Statute of 1914, took into consideration the religious composition of the country, reorganizing the office of the head of state in the form of a Council of Regence, whose members were either laics or members of the four main religious communities in Albania, while in Kosovo the Yugoslav government tried to integrate the community to the wider Slavic Islamic community. In Albania, the reorganization of the Islamic community was to be on a strict national basis. Its statute, in fact, affirms the distance to be kept from the Mosque of Istanbul, an inexistent hierarchical organ. Given this assumption, the Albanian Islamic Community tried to survive the secularist reforms promoted by king Zog. After the nineties, during what Oktem calls a brief '*wahabist intermezzo*' (Oktem 2011), the Albanian Islamic Community resisted to the temptations of charities and funds coming from the Gulf States. The Grand Mufti of Albania, Mr. Hafiz SelimMuca (Muca 2012) strongly stated that the 600 mosques scattered in the country are run by strictly Albanian nationality muftis. The Community has even '*dispatched*' a mufti of Albanian nationality to an Albanian community in Connecticut, USA. According to Mr.Muca, there are many requests from Albanian emigrant communities for muftis or religious leaders from their country of origin. Even in countries of recent Albanian emigration, where the presence of religious Islamic institutions is considerable, like for instance Italy, the Albanian Muslim emigrants very rarely frequent mosques, despite their religion (Negri&Scaranari Introigne 2005). This is a common situation in a context, which, if not related to the national identity, reflects the local dimension of the religious understanding among Albanian Muslims.

In the same line of argument, we try to interpret the autobiography of the Albanian writer Petro Marko (Marko: 2000) who came from the southern part of Himara, as he describes the relations of his hometown, that was mainly orthodox, with the other close sub regions of Vlora and Dukat, inhabited mainly by Albanian Muslim population. Both groups identified themselves in terms of religion, but their periodical clashes related more to the right to use land for their flocks of animals, rather than to go any further. Indeed, religious affiliations in Albanian lands were subject to distinctive and more regionally-based problems, rather than linked to a particular way of considering the Albanian nation. In short, religion remained a distinctive feature and yet a private matter which never exceeded the domains of, what in a Western country, would have been defined as a normal relation between a laic state and various religions. Religion in Albania, rather than conforming, it conformed to the traditions of self-government, autonomy and aversion to central power.

Draper (Draper 1997) explains the absence of religious animosity with the thesis that in part, this was an arrangement that fitted to contrast the falling of the Ottoman Empire. In an interesting essay, Gurakuqi (Gurakuqi: 4) strongly holds that the reason that the Catholics supported Albanian nationalism was partly because they did not identify themselves with a particular nation. This holds true as we move on to the later stages of the Albanian history in which religious identities did not have to be put forward as singular or well-structured concepts, but rather as subordinates to this pragmatic Albanian identity. This is in fact a singularity in the Albanian nationalist discourse, partly for the reasons explored above. The relation of the “common” Albanian citizen with religion still retained a high grade of continuity with the local space, rather than assuming or creating a more global or ‘*imagined community*’ strictly divided from that of being an Albanian. It is also true that this was an elite-oriented process where local religious identifications passed in the first place through the local “*beys*”, rather than through religious structures. The most regulated and active community, namely the Catholic Church, committed itself strongly to the creation of an Albanian state, as a shield of protection against the expansions of the Serbian state (Castellan 1996). In fact, the coalescence of different religious identities through the Albanian one revealed that the nationalist discourse was more than a pure thought derived from European romanticism. It was rather a sum of threats reflecting a present situation. Indeed, we define Albanian nationalism as a reflection rather than an agenda inspired from the ideals of the French revolution or European romanticism.

Conclusion

By way of conclusion, we can maintain that Albanian national memory has shown signs of vagueness as regards the definition of values and interests. This can be linked to the fact of massive illiteracy before the Communist regime, as well as to the fact that every new regime that Albania has experienced in the last hundred years has imposed itself in plain antagonism with the previous one. Therefore, trying to start anew has done no good to preserving national memory. For the same reasons, national memory has been occasional. Third, we have seen that national memory has been a result of negotiations between the political elites and the mass of population. The role of elites has been that of directing the process, but only to the extent of preserving legitimacy; meaning that certain political values of the masses such as family organization and traditional morality have always been evoked in the political discourse. Also the religious memory of Albanians has been quite vague, but for another reason. Although one cannot maintain that there have been severe confrontations among the different religions in Albania, still, one cannot claim religious harmony, but more appropriately religious consensus. However, that consensus has been built on very broad and abstract foundations, thus contributing to vagueness in the perception of religious duties and obligations of other Albanian religions. Temporally speaking, fragmentation of communication on religion has occurred during the Communist regime for almost 30 years. After that, religion has tried to restore itself, but has found a society less reliant on religion for solving its problems. Religious memory has generally been preserved there where local community has been important. That is because religion has performed well the function of differentiating communities and giving them identity. In line with this, and unlike political memory, religious memory has been a product that can be mostly attributed to the efforts of the masses. In light of the above, we maintain that reforms initiated to transform Albania into a fully-fledged Western democracy that relies on the rule of law and market economy need to take account not only of technical and administrative obstacles, but more fundamentally of the difficult problems and the resistance posed by the specifics of Albanians’ collective memory.

Abstract: This paper seeks to examine the Bulgarians' attitude towards wine tourism in Greece and their willingness to practise it. Wine production in Greece is regarded a good condition for the development in wine tourism, as tourism is one of the most important sectors in Greek economy. In terms of marketing, there is a significant number of wine cellars practicing wine tourism with the concern of the Greek producers for the quality labels of the wines aiming at increasing the visitors' interest. Consequently, wine tourism can enhance the annual percentage of tourists who travel to Greece. The present survey was conducted between 1st to 31st of May in 2009 among potential wine tourism consumers in a specific tourist region in Bulgaria, the Burgas region, due to its rich tourist resource for the traditional tourism. The research was based on a questionnaire structured by us with population of 200 respondents and its results were processed with statistical software SPSS. The data shows that the biggest percentage of the respondents were familiar with wine tourism and the specific nature of the tourism services, they had visited Greece and they were satisfied with the service quality in the Greek tourist destinations. Moreover, it was found that wine tourism is preferred by tourists having a higher degree of intelligence and that Bulgarians are not familiar with wines and wine making in Greece. In the future, Greece in the context of tourist marketing, must launch a permanent advertising campaign so as to be promoted as a destination for wine tourism.

Keywords: wine, tourism, marketing, Greece

1. INTRODUCTION

The past several years significant developments have been witnessed in wine tourism in many regions worldwide together with a growing consumers' interest in this alternative form of tourism (Beames, 2003; Carlsen, 2004; Stamov & Nikovska, 2007; Thach, 2007). An increasing number of tourists set off on a journey motivated by the possibility of learning more about wine: getting familiar with new wines or tasting their favourite ones, studying some details of vine growing and wine making in a certain area, meeting local people who produce popular wines and learning about their traditions, about the customs and holidays related to wine (Charters & Ali-Knight, 2002; Houghton, 2001; Macionis & Cambourne, 1998; Stamov & Nikovska, 2008a).

Nowadays, motives, life style activities, personal values and traits are some of the variables that are related to wine tourism and wine consumption as well (Nella, 2012). This trend is further enhanced by people's growing desire to practice non-traditional tourism (Charters & Ali-Knight, 2002; Stamov & Nikovska, 2007). Because frequently, winery tours are regarded a collateral activity to an organised vacation to Greek islands (Alebaki & Iakovidou, 2011).

There is insufficient information about wine tourism in Greece regardless of the prerequisites for its development: (1) significant tourist flow and (2) well-developed wine making industry. Tourism is one of the most important sectors of Greek economy (Spinthiropoulos, Nikas & Zafeiriou, 2020). Greece ranks 15th in the world in the number of international visitors: in 2008 they were 15,449 million. Wine

production in Greece is also a good condition for the development of wine tourism: around 74 thousand hectares of wine plantations, a wide range of wines of a large variety of styles. The country is divided into 9 wine regions, each having its own identity: Macedonia, Piraeus, Thessaly, the Ionian islands, Peloponnese, Thrace, the Aegean islands and Crete, Santorini (Greek Wine Federation, n.d.). The wine region in Peloponnese though, is regarded to be the biggest area in Greece that produces wines and also one of the oldest wine-producing regions of the country (Karagiannis & Metaxas, 2020). There is a significant number of wine cellars practicing wine tourism; various wine tours and routes of different duration are offered. The <<Open Doors>> is regarded as one of the most important annual wine events, that is being held during the end of every spring season in most of the Greek wineries (Nella, 2012). But a winery not only does it become an additional sales outlet, but through the feedback that it takes from the customers, it assists in the gaining of intelligence in marketing (Frost, Frost, Strickland & Maguire, 2020).

More and more studies these days are focused on wine tourism (Carlsen, 2004; Getz, Dowling, Carlsen & Anderson, 1999; StamoV & Nikovska, 2007; StamoV & Nikovska, 2008b). There is currently a wide circle of knowledge of the markets for this type of tourism and its products. The majority of these studies are descriptive, others result from the summing up of data from different sources; there have also been studies of events and occurrences. Therefore, the research should also be aimed at the prospective tourists' attitude to the practice of wine tourism and the analysis of their motivation.

The aim of this study was to investigate the Bulgarians' attitude towards wine tourism in Greece and their willingness to practice it.

2. RESEARCH METHOD

With a view to achieving the above aim, a survey was conducted among potential wine tourism consumers in a specific tourist region in Bulgaria: the Burgas region. The reason for surveying consumers based in this territory lay in the rich tourist resource they possessed for traditional tourism, i.e. seaside holiday, and their presumed willingness to explore alternative forms of tourism.

The research was based on a questionnaire structured by us and containing questions eliciting information about the respondents' status and about their opinions, attitudes, ideas, motivation, travel behaviour, etc. related to wine tourism in Greece. The survey was conducted between 1st to 31st of May in 2009 in different districts of Burgas using the direct interview method, with population of 200 respondents, 30% of them from the central part of the city and the remaining 70% from other Burgas districts and areas; the sample was representative, 95% confidence level. Statistical software SPSS was used for the processing of results.

3. RESULTS

3.1. Market segment

In terms of the educational status of the interviewees, over a half (66%) had university education. Those having secondary, secondary special or college education were 26%, and the respondents holding more than one bachelor and/or master degree together with the ones holding a research degree or title were around 7%. The respondents with primary or no education constituted 1%. Out of the total population, the gender correlation was 75% men and 25% women. The respondents were dominated by the age group of 35-50 years (71%), followed by the group of people over 50 years (19%), the age group of 20-35 years coming at the end with 10% of the total population. As regards material status, over half of the respondents (75%) had a monthly income exceeding 800 Bulgarian levs, followed by those with an average income of 350-800 levs (13%), and lastly, with 12%, came the respondents defining their income as 'low' (200-350 levs). Social status of the respondents: 68% married, 14% divorced, 6% widowed, 9% engaged, 3% single.

3.2. Motivation and behaviour of travellers in relation to wine tourism

Out of all respondents, 87% were familiar with wine tourism and the specific nature of the tourism services and travels offered in relation to it. The percentage of people with little knowledge of wine tourism was 9%, and 4% of the respondents stated they were not familiar with the specificity of wine tourism.

The majority of the respondents had never visited wine tours but had recognised the need for undertaking a journey for this particular purpose at a future moment. Their percentage in the total population reached 80%.

The interviewees ranked France first with 77% among the countries they would visit on a wine tour. According to the generalised results in percentages, Italy came next with 11%, then Spain with 8% and Bulgaria with 4%.

Out of the interviewees who provided an answer, 61% were interested in local traditions and customs and were willing to travel for wine tourism purposes in order to get acquainted with those traditions and customs. 27% of the respondents went on journeys focused on wine tourism driven by the need to learn more about the local wines, so the goal of their travel was the diversity of the grape sorts and wine varieties characteristic of the visited region. 10% was the share of the respondents who defined the goal of a wine tourism trip as participation in local wine celebrations and festivals. The percentage of those who replied that they went on a wine tourism trip solely for the purpose of undertaking something new and different was 2%.

Most of the respondents thought a wine tour should be continued for three days (68%), and they wanted to accomplish it in the company of family or friends (82%). They would prefer an organised travel by coach and hotel accommodation. According to the majority of the interviewees (66%), 2-3 cellars should be visited per day.

The analysis of the money that the respondents would be willing to spend within a wine tourism trip arranged the results as being followed: (1) the highest percentage (73%) of interviewees could not determine how much money they would need for a wine tourism trip or the amount of the expenses they would incur during that trip; (2) the interviewees forming around 15% of the total number of respondents were willing to spend up to €1000 of their personal budget; (3) 3% of the respondents were ready to spend over €1000; (4) 9% of the interviewees would readily spend up to €500. The tourists would spend the money mainly on wine purchase (58%), followed by visits to restaurants and tasting local food (28%) and purchase of various gifts and souvenirs (14%).

3.3. Attitude towards wine tourism trips to Greece

The questionnaire results showed that 61% of the interviewees would set off on a trip for tourist purposes two and more times per year. 20% travelled up to twice per year.

48% of the interviewees gave positive answers to the question whether they had visited Greece, and 31% had been part of an organised tourist group. Most of the tourists had visited Greece to get acquainted with the cultural and historical heritage of the country (81%). The Bulgarians were satisfied with the service quality in the Greek tourist destinations (73%). They did not have detailed knowledge of the typical Greek wines, the wine making history, the regions or the famous wineries.

More than half was the share of the respondents who gave a 'Yes' answer to the question if they would visit Greece on a wine trip. Their percentage was 88%; the remaining 12% formed the share of the interviewees who would not undertake a journey to Greece as tourists for wine tourism. If a wine tour to Greece was organised, Bulgarian tourists would first like to enjoy the picturesque scenery and natural sights, to familiarise themselves with local wine making and taste Greek wines (63%). They showed less interest in wineries and the conditions in them (27%), and 25% of the interviewees also insisted on the service quality.

4. ANALYSIS AND DISCUSSION

Education. The generalisation of the survey results showed that on one hand, the interviewees who had accomplished a high education level predominated, and on the other hand, the percentage of the people who went on a tourist trip at least once per calendar year was also higher. Therefore, people with higher education demonstrated a more pronounced and clearly outlined need for tourism as a whole, wine tourism in particular. Hence, we could infer that wine tourism as a specialised kind of tourism is attractive and would appeal to a more intelligent and better educated circle of potential consumers that could be viewed as a future tourist contingent. Arguments for this fact can be found in the very specificity of wine tourism and related tourism services.

Gender. The percentage of men significantly exceeded that of women, which was not surprising. The 25% share of women in wine tours was found to come mainly from married couples.

Research shows that this kind of tourism is less attractive for the female part of tourism service consumers on a global scale. Some authors believe that men have more knowledge of wines (Barber, 2009). Ladies, who nevertheless go on wine tours and participate in organised wine tourism groups, most often accompany their husbands.

It is men who most frequently go on one trip aimed at wine tourism. This fact results from the male consumers' natural and inherent interest in wine and everything related to it: growing the vine plants and grapes, the variety of grape sorts, grape harvesting, processing technologies for the produce, bottling, storage and consumption of the finished beverage. In the <<New World>> countries women are the mainly wine tourists, whereas in Europe it is a male concern (Alebaiki & Iakovidou, 2011).

It needs to be mentioned that wine tourism consumers are not necessarily consumers of the wine beverage only. There is a large share of people who possess a curiosity –based need to learn anything related to the beverage rather than be its passionate consumers (Charters & Ali-Knight, 2002). Wineries themselves could try not to bring in contact audiences that have wine interests that differ by defining a special admission in particular days and hours for groups (Nella & Christou, 2014).

Age group. The results based on the age criterion are not surprising: the predominance of the 35-50 age group among the interviewees shows that this is the age group that is the most open to surveys, to tourism-related questionnaires in particular. This is the age group of the active part of a country's population, well-off potential consumers having a fixed holiday period every year which proves very convenient from the point of view of organised travel, including wine tours.

The percentage of older interviewees is not surprising either: it demonstrates and confirms the idea that elderly people have clearly outlined needs for tourism. This age group of potential consumers has more spare time and is not so busy during the calendar year, a factor that makes it even more attractive and turns it into a target segment of the wine tourism market. The relatively low reported percentage of interviewees in the 20-35 age group can be attributed to the fact that this part of the population prefers extreme, relaxing, holidays and tourist travels as a hobby or for sports.

Income. The high monthly income shared by the majority of the interviewees corresponded to the results obtained for the education criterion where the predominant percentage was made up by people with higher education degrees.

Higher income implies a large and increasing share of the savings that consumers have the ability and willingness to set apart from their financial resources. The interviewees were willing to redirect these savings to potential tourist travel expenses, and since analysis showed that this age group (35-50 years) had greater need for and interest in wine tourism, its members were among the most frequent consumers of this product.

Marital status. The survey results showed a predominant percentage of divorced or married respondents. It corresponded to the higher percentage of respondents who declared active tourism twice or more on a yearly basis. These results provided the basis for concluding that wine tourism was preferred by and was also attractive to married couples and divorcees.

Frequency of tourist travels. The results of the question on the frequency of travel for tourism in different forms had been anticipated. The higher percentage of respondents travelled for tourism two or more than two times a year (83%). The majority of the working part of the population tries to invest a maximum of positive emotions – such as those experienced during a tourist trip – in their spare time. That part of the interviewees had the financial means, high level of cultural background, curiosity and free time needed for participation in organised wine tourism groups or an individual wine tourism trip.

Knowledge of wine tourism. The questionnaires showed an exceptionally high percentage of respondents who had knowledge of wine tourism as a kind of tourism. The results were in conformity with the results of the question related to the interviewees' education level. According to the results, the higher level of education the interviewees had accomplished, the more profound their general knowledge was.

The conclusion is that wine tourism is preferred by tourists having a higher degree of intelligence. Therefore, the focus of tourism services offered is on the needs of brighter visitors and tourists. Research shows that the most important motives for tourists in order to visit wine route estates are a meeting with the winemakers, a welcome wine tasting, the purchase of different kinds of wine and the learning about how wine is produced and how grapes are cultivated (Vlachvei & Notta, 2009).

Wine tourism travels undertaken. Along with the high percentage of people who replied that they travelled two or more times a year and were familiar with wine tourism, there was also a high percentage of respondents who had never travelled or taken part in wine tours, but were willing to go on a tour of this kind.

The results showed that from the point of view of demand for wine tourism related services there was a growing interest in and possibilities for travelling, in terms of a financially sound basis of the demand, as well as availability of spare time and interest in the specificity of wine tours.

On the other hand, wine tour supply on the tourism service market is still low, hence entrepreneurs and business in general need to increase the investments in tourism service supply and variety within the area of wine tourism, in advertising and promoting this kind of tourism.

Motivation of a wine tourism trip. The questionnaire results demonstrated a high percentage of people motivated to go on wine tours by their interest in local traditions and customs. This showed that when wine tourism was concerned, tourists would combine their specific curiosity and passion for wine with their cultural and historical needs for familiarity with the local history, folklore and mythology.

The second place was taken by one of the main goals of travelling along a wine route: learning about local wines, their specific features and characteristics. This regarded the properties of wines and grape sorts together with the grape growing technology, wine making stages, beverage storage and consumption. Research has shown that Greek producers in terms of marketing employ quite often quality labels, as the quality information of the wines is important to be known to the consumers and it also distributes the wine. Greek producers have also participated in international competitions and gained the first awards (Vlachvei, Notta & Tsakiriniadou, 2012).

Participation in wine celebrations and festivals accounted for a low percentage since prospective consumers had fairly little knowledge of the different wine celebrations and festivals held. What is needed in this aspect is advertising and promotion of these celebrations, so that they could become familiar to people who travel and go on wine tours. Wineries, in the context of marketing, should adopt strategies in order to increase the visitors' interest. A well-organised introductory wine tasting with the send of invitations could appeal to some homogenous groups, who like wine tourism trips (Nella, 2012).

The interest in the contact with something new and different had the lowest percentage since tourists who chose to participate in wine tours had been driven by a clearly defined need and preliminary information, by an interest in wine that had existed long before they contemplated or undertook a travel of this kind.

Travel behaviour. The interviewees had a clear idea of a wine tour organisation. Their behaviour was determined by their expectations concerning the wine tour progress, the accompanying events and destination characteristics.

Destination and Greece's appeal as a tourist destination. Bulgarian tourists visit Greece, but their main reason is the acquaintance with the cultural and historical heritage of the country. The degree of tourists' satisfaction with the service quality in Bulgaria's southern neighbour is high. These results confirm Greece's image as a leading tourist destination. Respondents preferred and ranked France first as a wine tourism destination, but there was also a predominant percentage of those who would participate in a wine tour having Greece as a destination. Countries like France, Italy and Spain have established their firm tourist image as wine tourism destinations. Bulgarians are not familiar with wines and wine making in Greece.

With a view to promoting new destinations, such as Greece, a large scale and permanent advertising campaign needs to be launched supported by investments and constant involvement both by the businesses and by different branch and non-government professional organisations. Guidebooks, magazines, tourist advertisements and brochures, recommendations from friends and internet sites can be used as sources of information. In the next years a cooperation of wine and tourism should be made so as to enhance tourism marketing and the local economy and to give versatility to Greek products of tourism especially the Peloponnesian (Karagiannis & Metaxas, 2020). In addition, Greek wineries need to profile wine tourists in order to have their motivations identified so as to follow a better strategy in tourism marketing (Tataridis, Kanellakopoulos, Kanellis & Gatselos, 2019). Moreover, tourism marketing as a kind of internal marketing conducted by the owners of the wineries, can lead to the growth of the annual percentage of tourism, who visit Greece every year.

4. CONCLUSION

The Republic of Greece has an exceptionally rich natural and anthropogenic potential for wine tourism. The fact that the country successfully develops sea, recreational and cultural information, tourism is a prerequisite for combining wine tourism with another kind of tourism. Moreover, advances in wineries and wine productions are creating one of the most exciting eras for marketing. Potential Bulgarian tourists are willing to visit Greece for wine tourism and to combine a tourist travel with wine tourism elements.

Abstract: Business process modeling is a technique that involves creating a visual depiction of a business process. This is typically achieved by using business process modeling tools like flowcharts and universal business modeling process notation.

Business process modeling is used to identify improvements in an organization's business processes or workflows. It does this by mapping two different iterations of a given process. The first is the process as it currently exists without implementing any changes. The second is what the process will be once improvements have been made.

It is possible to manually sketch out the steps in a process. This method is, however, far more time-consuming, and less effective than leveraging an automation solution like business process modeling software. With software organizations can easily create and run a process model to identify areas for improvement.

The terms business process modeling and business process mapping are often used interchangeably. While the techniques are similar, there is a difference. Business process modeling is generally used to map out low-level processes. In other words, the purpose of the diagram is to provide a somewhat broad overview of how a process works. Business process mapping, however, can be used to create both broad and highly detailed diagrams. Where maps are detailed, their purpose is to provide operating procedures to guide stakeholders on the efficient completion of a process. Note that both business process modeling and business process mapping are used as part of a broader initiative like business process management.

Keywords: Business Process Modeling, mode, mapping, optimization.

1. INTRODUCTION

The objective of this paper is to provide suggestions to the Business Process Modeling (BPM) community as to how they can better utilize discrete event simulation to deliver real business value for their organizations and customers. There have been many papers and books written on how to conduct simulation projects, covering both the 'art' of model design and the statistics crucial for the valid use of data and for good experimental design. This paper will not go over those aspects but will draw upon how simulation has been applied in a 'pure play' form by Operational Researchers and Industrial Engineers and how the technique has been adopted by the Business Process Modeling community. The point of view developed in this paper is to a degree a personal reflection based upon my experience in discrete event simulation over a 30 year period. In particular drawing upon extensive simulation project work undertaken within the automotive industry during the early part of my career and the experience gained applying the technique across all sectors. The second major contributor being my experience collaborating with leading Business Process Modeling providers including IBM and Software AG (previously IDS Scheer) to incorporate simulation within their toolsets. The paper begins by introducing the background of Business Process Modeling, then covering the development of simulation technology independent to BPM before moving onto how simulation is used with BPM. Finally, a number of observations and recommendations are provided to promote thinking amongst both providers of simulation aligned with BPM as well as potential users

A business process is a set of logically related tasks performed to achieve a well-defined business outcome. Examples of typical business processes are elaborating a credit request, hiring a new employee, ordering goods from a supplier, creating a marketing plan, processing and paying an

insurance claim, and so on. Business processes are recently becoming an important topic in the context of enterprise computing where both inter- and intra-companies workflows are involved. There are mainly two research areas in the context of enterprise computing: BPM (Business Process Management) and SOC (Service-Oriented Computing). Relevant process modeling studies both in BPM and SOC can be further divided into semantic and non-semantic approaches. Similar with the mission of (semi-) automatic service discovery, composition and execution for semantic Web services, semantic processes also aim at automatic process discovery, composition, invocation, monitoring etc. Besides the division of semantic and non-semantic methods, process modeling approaches can also be classified according to industrial standards (or proposal) like BPEL, BPMN etc. and theoretical foundations such as Petri Net or process algebras.

2. BUSINESS PROCESS MODELING

Techniques to model business processes have been in existence in many forms since early in the 20th century. Basic flow charts have been traced back to the 1920's developing into more modern approaches such as IDEF in the 1970's and more recently UML (Unified Modeling Language) and latterly BPMN (Business Process Modeling Notation). The actual term Business Process Modeling (BPM) may have originated with S. Williams (1967), but it became more popular in the 1990's. BPM emerged as a structured approach, often extensively used in the support of software engineering, to describe a collection of related activities to deliver a desired goal. 'Process' thinking became the cornerstone of business improvement and drives for greater productivity in many organizations. Business Processes were sometimes categorized as Management, Operational or Support processes. The operational processes being those related to the core activity of the business in terms of manufacturing or providing a value-add service to customers. Around this time Business Process Re-engineering became popular through Michael Hammer & James Champny's book "Reengineering the Corporation: A manifesto for Business Revolution", written in 1993. In 1984 Professor Scheer founded IDS Scheer AG; this took Business Process Modeling to the next level, substituting the 'M' of modeling for that of management. Software AG have since acquired the IDS Scheer company. Although Scheer's approach included business process modeling he created a much more sophisticated methodology fully encompassing the strategy, design implementation and control of processes, including IT architecture, data and the organization that supports the business enterprise (Figure 1):

Figure 1

Core principles in business process modeling have always been the need to share and maintain process models across and between organizations without ambiguity; as such standards and methodologies have dominated the development of the discipline. These models also began as largely 'static pictures' with no intention of being executed in their native form. This aspect did change with the development of workflow engines and their integration into Business Process Management Suites. In my opinion the dominant influences on BPM have come from the IT side of the business, modeling processes for implementation in software. Business Process Management as an approach or philosophy rather than as

purely software tools adopted simulation as a technology or optional component within the methodology. Many Business Process Management vendors (Software AG included) provide simulation functionality as an added component to their suites. The way simulation is supported by these toolsets varies widely, in terms of the capability provided and the way it is integrated and presented to users.

With many definitions going around and multiple ways to go about it, business process modeling (BPM) can be a bit confusing, especially for a beginner. But when you go deeper you'll realize that there isn't much of a difference in most approaches. This business process modeling tutorial will help you learn more about the various definitions, features, history behind BPM. And we'll briefly touch on the various business process modeling techniques as well.

Among many definitions available online for Business Process Modeling, following are few that captured our attention;

- BPM is a mechanism for describing and communicating the current or intended future state of a business process.
- BPM is a means of representing the steps, participants and decision logic in business processes.
- BPM is a method for improving organizational efficiency and quality. Its beginnings were in capital/profit-led business, but the methodology is applicable to any organized activity.
- BPM aims to improve business performance by optimizing the efficiency of connecting activities in the provision of a product or service.
- BPM is a set of activities for representing business processes in a formal way enabling analysis and further improvement of these processes.

Business Process Modeling is a combination of various process related steps such as Process Mapping, Process Discovery, Process Simulation, Process Analysis and Process Improvement.

With all above being true, it can be summarized as ***how work gets done in an Enterprise or an organization***.

BPM has emerged rapidly throughout the last two to three decades, and has replaced previous organizational efficiency practices such as the Time and Motion Study (TMS) or Total Quality Management (TQM). Such demand for BPM is a result of,

- Increasing transparency and accountability of all organizations including public services and government
- Increase in usage of information and communication systems
- Modern complexity of business

BPM can be considered as a quality management tool due to its 1) technical nature, 2) the process emphasis and 3) analytical approaches & responsibilities arising in the improvement of quality, in the market. Business process modeling is highly useful in change management of organizations.

A summarized list of BPM features are as follows;

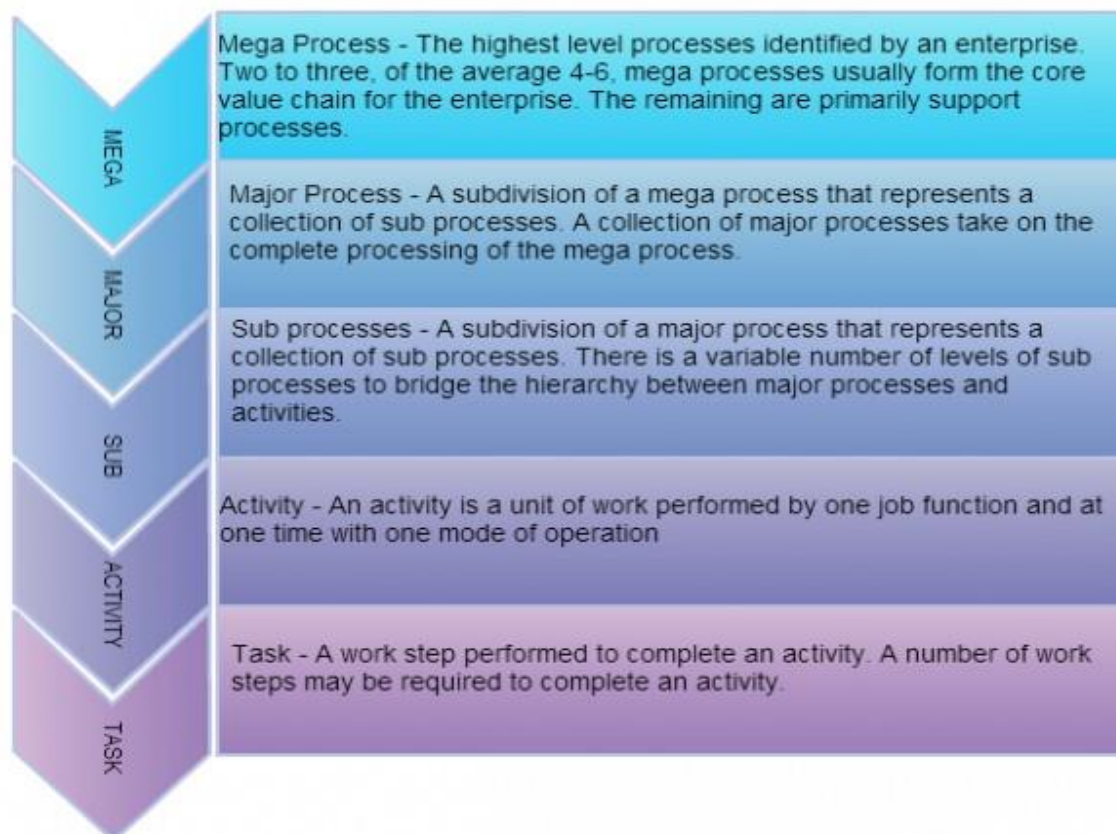

- BPM is commonly a diagram representing a sequence of activities. It typically shows events, actions and links or connection points, in the sequence from end to end.
- It mainly focuses on processes, actions and activities, etc.
- A Business Process Model includes both IT processes and people processes.
- Business Process Modelling is cross-functional, usually combining the work and documentation of more than one department in the organization.
- Resources feature within BPM in terms of how they are processed.
- People (teams, departments) feature in BPM in terms of what they do, to what, and usually when and for what reasons, especially when different possibilities or options exist, as in a flow diagram.

- Business Process Modelling may also include activities of external organizations' processes and systems that feed into the primary process.
- In large organization's operations Business Process Models tend to be analyzed and represented in more detail than in small organizations, due to scale and complexity.

Business Process Modelling is to an extent also defined by the various computerized tools or software which is used in applying its methods. These tools evolve with the change of time and therefore it is advised to keep an open mind on how BPM can be used.

Following hierarchy is mainly used in process modeling for large enterprises. It categorizes all the processes of an organization in to five levels so that it is easier to streamline the outcome. (Figure 2).

Figure 2 (Business Process Model Hierarchy).

3. BENEFITS OF USING BUSINESS PROCESS MODELING

Business process modeling is becoming a higher priority for business managers and analysts as there is an increasing emphasis in organizations to document, understand and improve their business processes. Managers and business owners are realizing that operating their businesses without well documented processes is just like a pilot who is flying blind without properly functioning instruments and navigation. Well documented and streamlined processes are essential in a smooth functioning of a team as they help ensure consistency, track ability and focus towards a shared goal. Business process modeling is a combination of various process related steps such as Process Mapping, Process Discovery, Process Simulation, Process Analysis and Process Improvement. Although a holistic business process modeling exercise would cover all these steps in some depth, analysts have found that even a partial modeling exercise that involves a subset of these steps is a good start and yields significant benefits.

Business process modeling provides important benefits to companies and organizations such as the ones listed below.

1. Align operations with business strategy

Implementing a business strategy or new business model requires changes in the operations and in how people perform their work.

Business process modeling facilitates this by helping managers and executives ensure that business processes are consistent, and enable business execution toward achieving the overall strategy and goals of the organization.

2. Improve process communication

Having a very clear idea of what should be done, how it is supposed to be done, and what the exact role of every team member entails, represents key factors that lead businesses and teams to success.

Business process modeling enables the documentation and communication of an organization's business processes. It provides a common, unified language and methodology for communicating processes, information and guidelines about the processes; it minimizes the loss of business process knowledge (for example, as a result of a loss of staff); jumpstarts the organizational process documentation initiative; and, allows for rapid knowledge transfer with thoroughly documented processes.

3. Increase control and consistency

Successful companies and organizations also attach high importance to well-designed business processes and rules to ensure that they are consistently applied the same way every single time.

Business Process Modeling makes this possible, as it provides the formalization of existing processes that may not be well-documented, eliminates guesswork, and ensures that these documented processes follow the company guidelines and legal regulations.

4. Improve operational efficiencies

The process simulation and analysis steps of BPM provide understanding of the process flows and helps managers determine if there is room for further optimization, improving the process cycle time, enabling better resource utilization, and allowing modeling of the process before actually implementing it, thus minimizing disruptions.

5. Gain competitive advantage

All the benefits mentioned above lead to a significant competitive advantage for an organization that has invested the time and effort to document, simulate, constantly refine, and improve its business processes.

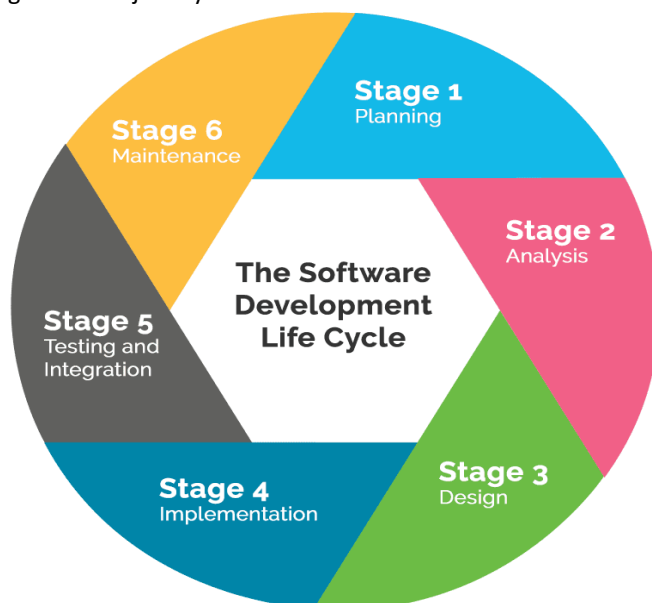

A business that has aligned its operations with its strategy, is agile, has control over its processes, runs efficiently, and has a well-trained staff, is likely to be performing at its best.

4. SIMULATION OF BUSINESS PROCESS MODELS

The simulation of business process models which have previously been captured has an obvious attraction. Clearly simulation is a way of testing and measuring potential improvements to these process models before implementation, potentially saving costly mistakes and avoiding pilot projects where process changes are tested in the real world. Simulation is strongly recommended and identified as one of the ten 'must have' technologies for Business Process Management toolkits by the analyst firm Gartner. Many business process modeling and management suites now have simulation built in. In some cases the simulation capability is newly developed by the BPM tool vendors and in other cases it is based upon existing stand-alone simulation tools and integrated within the BPM software. Different BPM tools follow different methods, however each follows a standard approach, the most modern being the BPMN standard. The modeling software is there to provide an environment to model processes, maintain and share these models, it is not there to provide simulation. In these tools simulation is seen

as an optional extra, often a desirable and strongly advocated optional extra. Business process models provide a static representation of the process being studied, simulation adds a dynamic component bringing the process to 'life' albeit still as a model. Additional information is required over and above that contained in the BPMs i.e. activity times, arrival information, resource availability and routing logic that can be executed within the simulation. This additional information is normally added to the BPMs using forms and stored in a proprietary manner often invisible from the process diagram. Some of this information is not always easily added, for example process modeling tools do not tend to have objects to represent queues and constraints for these queues, a second example is the overall control method that determines the routing or work prioritization, facilities to add this logic which has been a major part of the stand-alone simulation tools is usually not well addressed in the simulation provided for BPMs. The role of simulation in the business process world should be similar to that in the manufacturing or supply chain operations, however often the BPMs that get simulated have been constructed for other reasons. As stated previously the BPMs are often created as part of a software development cycle or to publish the process to workers, they have not been designed to help answer a specific business question. If these models are used for simulation to address a question other than a simple validation of the process design they are likely to be the wrong models. A recent simulation project at Bank of America initially used existing business process models that had been developed to support a business rationalization project following a merger. These models were very detailed and the process was modeled as a hierarchy with upwards of 80 separate models. The business question to be addressed by simulation was to do with resourcing decisions and how to cope with a backlog of work. Clearly for this purpose a simpler model of the process could be used, a new model was developed using the detailed models as information, this leaner model containing aggregated activities made the simulation project much more efficient and effective. Business Process Tools can be very detail oriented, given that these tools are likely to be 'owned' by IT or business analysts they are very suited towards the 'Design' and 'Implementation' steps of the project cycle shown below. Existing models may on the one hand be too detailed, similarly they may also be lacking. In that resources that support activities outside as well as those within the specific model being simulated may not be properly represented in terms of availability. Simulation has a big role in the 'Strategize' step where different business approaches might be compared prior to entering a detailed design phase (Figure 3).

Figure 3. Project Cycle – Software

The formal business process diagram method adopted by the toolset being used may not be the most effective modeling approach for the basis of a simulation model in the strategize phase, a more flexible conceptual basis and richer graphical representation might be more appropriate. The formality of

business process modeling is driven by a need for consistency and reuse across the enterprise, which of course is crucial in the mainstream business process diagramming activities.

5. CONCLUSIONS

Business process modelling is a means of representing the business activities, the information flow and decision logic in business processes. With the power of visualization, it is used to communicate information regarding a process and the interaction it includes within / between organizations either among the persons reading a model or the persons who create it. It externalizes the business knowledge with a view to agree and bind all stakeholder in a representation that is shared within an organization and is reflected in its information systems. BPM presents multiple granularity levels: from simple depiction of the workflow to simulation and execution, addresses complexity by emphasizing on specific aspects and by reusing models. BPM achieves a common understanding of business knowledge between an organization and IT experts and thus drives the design and implementation of software systems.

From the vendor or BPM software development perspective there should be a recognition that there are lessons to be learnt from the 'pure play' simulation software tools and that simulation in BPM is indeed in an 'early adopter' phase. The users of simulation within the BPM toolset are generally inexperienced with simulation analysis, this factor together with where process modeling as a technology is used by a business leads me to suggest a number of guidelines for the tool providers.

- Provide support in the form of 'wizards' or 'templates' to steer the user in the specific analysis they want to undertake, process design validation, process improvement, optimization of resources etc. providing the appropriate reports etc.
- Provide experimentation support to ensure robust results in terms run length or number of replications to ensure statistical validity.
- Develop partnerships with 'pure play' simulation suppliers to benefit from that experience in the design of simulation capability and the opportunity to utilize a full simulation software product should that be more appropriate

Leasing as a Source of Financing Small and Medium-sized Enterprises in the Slovak Republic – Empirical Analysis

Ľubica Lesáková¹

Miroslava Vinczeová²

¹ prof. Ing. Ľubica Lesáková, PhD., Faculty of Economics of Matej Bel University in Banská Bystrica, Slovak Republic, lubica.lesakova@umb.sk, ORCID: 0000-0002-7920-6508

² doc. Ing. Miroslava Vinczeová, PhD., Faculty of Economics of Matej Bel University in Banská Bystrica, Slovak Republic, miroslava.vinczeova@umb.sk, ORCID: 0000-0001-5380-0907

Abstract: Small and medium-sized enterprises are often constrained by lack of equity sources of finance and therefore remain dependent on other external sources of capital. Previous research has prevalently focused on the use of traditional debt sources of finance, especially bank loans. Hence, the article examines other debt sources of financing SMEs and pay special attention to leasing. Leasing appears an appropriate debt form of financing business needs that help firms overcome obstacles typical for standard bank loans. The aim of the article is to evaluate the use of leasing in SMEs in Slovakia in the years 2015 – 2019 and identify key obstacles that most affected its use in the period under review. The questionnaire survey was carried out from September to December 2019 on a sample of 891 Slovak SMEs. Sample representativeness was tested by the Chi-square goodness of fit test. To verify the formulated hypotheses, nonparametric tests were applied (the Friedman and Wilcoxon tests). The research results enable to evaluate the use of leasing in Slovak SMEs in 2015 – 2019 and identify main obstacles affecting it in the analyzed period. Based on the research results, the article provides ideas and recommendations aimed at the improvement and expansion of the use of leasing in Slovak SMEs by taking account of the current situation determined by the COVID-19 pandemic.

Keywords: Leasing. Small and medium-sized enterprises. Debt financing. Obstacles limiting use of leasing. COVID-19 crisis.

1. INTRODUCTION

Dynamic development of small and medium-sized enterprises is one of the factors essential to the favourable economic development of any country. Small and medium-sized enterprises demonstrate their viability not only by their share in the gross national product generation, value added or sales but also by their contribution to employment. Each economy is vitally dependent particularly on strong and viable enterprises of this size category. To enable them to play this role successfully, efforts should be put into their continued development and realization of their potential under the present challenging and turbulent conditions. Since equity sources of capital are often insufficient to finance activities of small and medium-sized enterprises, many of them are dependent on other external sources of finance. The searches and studies conducted until now have prevalently focused on traditional debt sources of finance, in particular bank loans. Therefore, we decided to examine other debt sources of financing of small and medium-sized enterprises and give special attention to leasing. In recent years, leasing has appeared as an appropriate form of debt financing of business needs which helps enterprises overcome barriers typical for standard bank loans. The results of the annual surveys of the Directorate General for Internal Market, Industry, Entrepreneurship and SMEs confirm that leasing belongs to the most popular debt sources of finance (other than bank loans). The article deals with these issues. Its aim is to evaluate the use of leasing as a debt source of capital in small and medium-sized enterprises in the Slovak Republic in the years 2015 – 2019 and identify key obstacles that most affected its use in the period under review. On the basis of the results of the realised analysis we formulate ideas and recommendations aimed at the improvement and expansion of possibilities to use this source of finance in Slovak small and medium-sized enterprises.

The rest of the paper is organized as follows: Section 2 presents the theoretical background based on the related literature. In Section 3, the main objectives including the main scientific objective and three partial aims supporting it are formulated. Following the set objectives, two hypotheses are constructed. The section also presents the used data description and the applied methodology explanation. Section 4

discusses the obtained empirical results, main findings and proposals. Section 5 provides main conclusions.

2. THEORETICAL BACKGROUND

Typical features of small and medium-sized enterprises including their low level of capital strength, a shortfall of assets suitable as collateral, unstable financial situation, higher sensitivity to business risk (due to insufficient and poorly prepared financial statements and plans) or insufficient credit history shape their profile of a considerably risk subject. Rahman, Rahman a Belás (2017) even talk of bank lending discrimination of small and medium-sized enterprises that results from the information asymmetry. Limited access of small and medium-sized enterprises particularly to debt sources of finance as its result is also confirmed by Moro, A., Fink, M., Maresch, D., 2015; Nangaki, L., Namusonge, S. N., Wandere, R. W., 2014; Canton, E., Grilo, I., Monteagudo, J., van der Zwan, P., 2013 and many others. On the other hand, problems and barriers typically faced by SMEs are hardly known to large companies. In SMEs, their existence leads to the emergence of the so-called financial gap also referred to as the Macmillan gap. Many authors (e.g. Raju, Rajan, 2015; Dong, Men, 2014; Majumdar, 2014; Sobeková Majková, 2011; Hyytinen, Pajarinen, 2008; Levenson, Willard, 2000; Rajan, Zingales, 1995 and others) are inclined to believe that the financial gap definitely results in a limited access of SMEs particularly to debt sources of capital.

As SMEs face more barriers when assessing traditional external sources of capital than larger enterprises, leasing appears an important element in their financing. It seems to be an appropriate alternative source of finance for SMEs expanding the range of their capital equipment financing options.

The origins of leasing trace back many centuries in history and we can surprisingly say that it is one of the oldest industries. As far back as the ancient Sumerians used leases on clay tablets for agricultural tools, land and water rights or animals. Its roots can be found in many ancient civilizations such as the Greeks, Egyptians, Romans and Phoenicians which used leasing as a tool to finance equipment, land and livestock. The oldest evidences include a record of King Hammurabi's Babylonian leasing law stretching back to 1700 B.C. (Elliott, 2016). At that time various items of equipment were leased including industrial and military tools and equipment but animals (mainly horses) and farming equipment prevailed. More opportunities for leasing came with the onset of the industrial revolution, especially for railroad companies. Modern-day leasing started to develop intensively in the 1940s particularly in a form of vehicles leasing in the USA where some manufacturers were establishing their own financial organisations. Since that time leasing has considerably evolved and manufacturer-selling has been significantly overshadowed by specialised leasing companies which has become an important player in the financial market as independent companies or subsidiaries of commercial banks. Incentive legislation in the 1950s and 1960s in the USA, Great Britain and also in Western Europe together with the technological revolution in the 1960s became a driving force of modern-day leasing. In 1995, the Ottawa Agreement entered into force representing one of the most significant attempts so far in terms of the international codification of some leasing aspects (História lízingu, 2008). Nowadays, the scale of leased assets involves many different items such vehicles, transportation equipment, computers, medical equipment, real estate, in the hotel industry leases may even include bathroom fixtures, furniture or paintings (McGuigan, Moyer, Rao, Kretlow, 2012).

Inconsistent legislative frameworks at the national levels result in a multitude of various leasing definitions. In Europe a definition provided by IFRS 16 appears the most common. It defines a lease as a contract that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration (Commission Regulation (EU) 2017/1986, 2017). Thus, leasing provides asset-based financing where the lessee does not receive direct finance from the lessor who retains ownership of the underlying asset. Therefore, no collateral is required and the lessee does not have to prove a credit track record which makes leasing a tool helping SMEs overcome some of the limitations of traditional bank loans (Mol-Gómez-Vázquez, Hernández-Cánovas, Köeter-Kant, 2019).

Recently, determinants affecting firm's leasing decisions have been examined in several studies, however, majority of them were carried out in developed countries and there is still lack of knowledge needed to understand leasing decisions in developing countries better (Li, Karim, Munir, 2016). This

particularly applies to SMEs in those countries. Some of studies carried out so far show that high importance of leasing was demonstrated in relatively young enterprises, those bearing comparably high credit risk and also the so called gazelles (i. e. the young high-growing enterprises) which reported the lowest rate of unsuccessful applications (Kraemer-Eis, H., Lang, F., 2012). As Zhang (2018) argues, one of the key benefits of leasing is that it facilitates access to capital for financially constrained enterprises and those having not enough assets to pledge for loan collateral which is of special importance in countries with weaker law enforcement. Berger and Udell (2006) also support the argument that financing alternatives involving the lender's ownership of underlying assets are less dependent on strong legal systems. Hulsink and Scholten (2017) claim that leasing companies which have their own risk policy may be able to offer more capital and services to young and small firms (including startups) than traditional banks. Jaszczuk, Białek-Jaworska, Opolski, Silwestrzak and Trzpioła (2018) add that leasing is often the only external financing alternative to equity for starting enterprises. Lease financing therefore seems efficient to enable enterprises which are, due to the information asymmetry, trapped in the financial gap and therefore often excluded from formal financial markets (Moyi, E., 2019) to overcome their financing barriers.

3. AIM AND METHODOLOGY

The main aim of the article is to evaluate the use of leasing as a debt source of capital in small and medium-sized enterprises in the Slovak Republic in the years 2015 – 2019 and identify key obstacles that most affected its use in the period under review. On the basis of the main scientific aim, we formulated three partial aims:

- (1) to analyse and evaluate the development of the use of leasing in SMEs in the Slovak Republic in the years 2015 – 2019;
- (2) to identify the main obstacles which determine the use of leasing in SMEs in the Slovak Republic;
- (3) to formulate ideas and proposals aimed at the improvement and extension of possibilities of the use of this source of finance in SMEs in the Slovak Republic.

Following the main aim and partial aims, we constructed two following hypotheses:

- H1: We suppose that the majority of small and medium-sized enterprises in the Slovak Republic primarily use leasing as a debt source of financing.
- H2: We suppose that small and medium-sized enterprises in the Slovak Republic consider the high price of leasing to be the main obstacle affecting their deciding on its use.

Primary as well as secondary sources of information were used in developing the article. The documents used to fulfil its aims include three categories of data. The first group of information comprises specialised literature concerning debt sources of finance. The issue of financing SMEs continues to be very much a live issue and, accordingly, we draw not only on book literature but also on specialised journal articles, proceedings, websites, publications of professional organizations and groups. The second group of information includes secondary data obtained from statistical surveys and yearbooks. The third type of information contains data gathered as a result of the questionnaire survey in the segment of small and medium-sized enterprises in the Slovak Republic.

The questionnaire survey was carried out in the period from September to December 2019. The electronic questionnaire was distributed by means of the service Google Docs. The obtained results were evaluated with the application of the mathematical-statistical methods and processed by means of Microsoft Office Excel and the software IBM SPSS.

The population consisted of 567 131 small and medium-sized enterprises established in the Slovak Republic, of which 550 016 were microenterprises, 14 159 small enterprises and 2 956 medium-sized

enterprises. In terms of the structure according to the legal form, the population consisted of 348 326 natural entities and 218 805 legal entities. In order to carry out the research, we addressed more than 4 000 small and medium-sized enterprises established in the Slovak Republic. Large enterprises were excluded from the returned questionnaire replies. The sample than consists of 891 SMEs. The sample representativeness was tested on the basis of two statistical features, namely a size of an enterprise according to the number of employees (broken down to micro, small and medium-sized enterprises) and according to the legal form (broken down to natural entities and legal entities). The structure of the sample is shown in Table 1.

Table 1: Number of enterprises in the sample according to the size of an enterprise and its legal form

	Microenterprises	Small enterprises	Medium-sized enterprises	Total
Natural entities	564	0	0	564
Legal entities	292	26	9	327
Total	856	26	9	891

Source: Own processing based on the results of the questionnaire survey.

Microenterprises have the largest share in the sample (96.07 %) followed by small enterprises (2.92 %) and medium-sized enterprises (1.01 %). The natural entities account for 63.30 %, the remainder consists of legal entities (36.70 %). On the basis of the results of the nonparametric Chi-square test of good fit, the sample is representative, on the significance level of 5 %, in terms of the size of an enterprise (broken down to microenterprises, small and medium-sized enterprises) as well as in terms of the legal form (broken down to natural and legal entities).

According to the statistical classification of economic activities SK NACE Rev. 2, the most represented enterprises were in the trade sector (20.70 %) followed by those in the construction sector (18.00%), enterprises in other industries coming under SK NACE O, P, Q, R, S (15.90 %) and industrial enterprises (14.40 %).

To achieve the main aim and partial objectives, we used several scientific investigation methods such as the analysis, abstraction, deduction, induction, comparison and synthesis. A number of mathematical-statistical methods were used. To accept or reject the formulated hypotheses, we applied the Friedman and Wilcoxon pair tests. The following part is devoted to the analysis and evaluation of results obtained by means of the questionnaire survey.

4. RESULTS AND DISCUSSION

A long-term appearance of insufficient availability of sources of finance and their appropriate structure in leading positions determining the order of problems and obstacles of SMEs' development has been evident. In the light of characteristic features for which SMEs acquire a higher risk profile compared to large enterprises, the access to traditional debt sources of capital is mostly affected. Although currently one can observe a positive trend when the barrier of insufficient availability of sources of finance has been losing its dominance and European SMEs consider other problems more significant (in particular the lack of customers or qualified employees), the problem of insufficient availability of debt sources of finance in this segment still prevails and it cannot be deemed to be definitely settled. The previous studies have paid more attention to traditional debt sources of finance, particularly to bank loans. Therefore, we decided to investigate other debt financing opportunities in Slovak SMEs. We will give special focus to leasing which, by its very nature, can be considered an appropriate and more available alternative of debt financing of SMEs.

Table 2 shows the use of debt sources of finance in Slovak SMEs in the period 2015 to 2019. The figures are based on the results of the survey periodically initiated by the Directorate General for Internal

Market, Industry, Entrepreneurship and SMEs. For comparison, the first part of the table also presents data describing the use of traditional bank loans although we do not further focus on them in this paper. The highlighted part of the table contains data showing the use of selected debt sources of finance including leasing.

Table 2: Use of selected debt sources of finance in Slovak SMEs in 2015 – 2019 (% of enterprises)

	2019	2018	2017	2016	2015
Overdrafts, credit cards	35	41	38	40	38
Bank loans	14	13	13	10	12
Leasing	24	19	21	17	18
Trade credit	15	16	24	17	13
Other debt	10	9	13	9	9
Factoring	5	2	5	4	3
Grants, subsidised loans	3	3	2	1	3
Debt securities	0	0	0	0	0

Source: Own processing based on SAFE report 2019 – country report, 2019; SAFE report 2018 – country report, 2018; SAFE report 2017 – country report, 2017; SAFE report 2016 – country report, 2016; SAFE report 2015 - country data, 2015.

When comparing all types of capital in the above table, the overdrafts together with credit cards appear the most popular. When looking beyond the traditional bank loans and focusing only on other debt sources of finance, it is apparent in the table that leasing is the most popular form of financing. Its use shows somewhat fluctuating development, ranging between 17 to 24 % of SMEs. In the last year of the period considered, the rate of its use substantially increased and its use was reported by almost one quarter of Slovak SMEs. The trade credit can also be regarded a significant source of capital in Slovak SMEs. Given its characteristics, one may believe that its popularity in small and medium-sized enterprises is predominantly determined by its good accessibility and lower burden of administration in comparison with other debt sources of finance. The trade credit is followed by unspecified other debt. Other debt sources of finance such as factoring, grants and subsidised loans are of limited use and debt securities were hardly ever used in Slovak SMEs in the examined period.

While the previous table contains data on the use of debt sources of finance including leasing in the analysed period only in the Slovak Republic, in Table 3 the use of leasing in Slovak SMEs can be compared with the EU-28 average and selected European countries including some selected European innovative leaders and V4 countries.

Table 3: Use of sources of finance in small and medium-sized enterprises in the Slovak Republic, EU-28 and in the selected European countries in 2019 (% of enterprises)

	<i>Slovakia</i>	EU-28	Sweden	Denmark	Finland	Germany	Czech Republic	Hungary	Poland
Use of leasing	24	24	32	26	36	32	24	20	39

Source: Own processing based on SAFE report 2019 – country report, 2019.

Table 3 indicates that the use of leasing in Slovak SMEs corresponds with the EU average and the same is also the rate of its use in Czech SMEs. Leasing is less than in Slovakia used in Hungary. Among the countries compared, leasing is the most popular in Poland and Finland. When comparing with the

selected innovative EU leaders we have to conclude that SMEs in the V4 countries with the exception of Poland significantly lag behind them in terms of the use of leasing.

In Slovakia, the 6 % year-on-year growth of leasing volume compared to 2015 was recorded in 2016 (Lízingový trh v roku 2016 s 1-ciferným nárastom obchodov. Tlačová správa, 2016). In 2017, leasing grew by 8 % (Lízingové financovanie osobných áut, ale aj strojov a zariadení, rástlo na Slovensku až desatinovým tempom. Tlačová správa, 2017). Leasing maintained its growing trend also in 2018 and 2019 with the average year on year growth rate of 5 % and 5.5 % respectively (Lízingový trh na Slovensku, 2019; Beracka, J., 2020). 2020 was however notable for negative impacts of the coronacrisis and leasing volumes dropped to 18 % (Uplynulý rok 2020 sa v lízingovom odvetví niesol v znamení pomoci klientom. Tlačová správa, 2021). Despite the last year's decline, leasing has recently been regarded as one of accelerators of economic growth in the Slovak Republic. We can therefore consider the upward trend of its use in Slovak SMEs (recorded before the coronacrisis) positive.

Financial and investment decisions including the area of funding and capital allocation substantially determine firm's financial stability and opportunities of its future development. It is important for any enterprise to choose an appropriate type of capital to finance their particular business needs. Leasing has recently appeared as a proper alternative of financing business needs by means of debt which helps businesses overcome obstacles typical for standard bank loans. The results of the annual "Survey on the Access to Finance" initiated by the Directorate General for Internal Market, Industry, Entrepreneurship and SMEs also show that leasing belongs to the most popular other debt sources of finance (excluding bank loans). In many EU countries leasing is the most often used. Since we see the trade credit as a source of financing which is very widespread in business practice and many businesses do not even realise that they in fact use debt sources of finance after the receipt of the supplier's invoice, we excluded it from the following hypothesis.

In the hypothesis 1, we suppose that in terms of debt sources of finance, leasing is mostly used in the majority of small and medium-sized enterprises in the Slovak Republic (excluding bank loans and trade credit). In the questionnaire survey, we asked respondents to state those of the selected debt sources of finance they obtained and used or at least tried to obtain in the three preceding years. The hypothesis was tested by means of the Friedman and Wilcoxon tests. Table 4 presents the order of the selected debt sources of finance determined in accordance with the results of testing.

Table 4: Selected debt sources of finance that Slovak SMEs obtained or tried to obtain in previous three years

Order	Selected debt sources of finance
1.	leasing
2.	advance payments subsidies, grants and EU funds
3.	loans provided by the owners loans provided by friends, family and fools microloans
4.	accruals factoring and forfaiting
5.	loans provided by non-bank institutions debt securities
6.	mezzanine loans

Source: Own processing based on the results of the questionnaire survey.

The order presented in the above table shows that **leasing is – as we supposed – the most popular source of debt financing from those selected sources we analysed. On the basis of this result we can confirm the hypothesis 1.** The findings indicate that as in enterprises in several European countries, leasing is the most often used source of capital among debt sources of finance (excluding bank loans and trade credit) also in Slovak small and medium-sized enterprises. The results of our research say that leasing was used in 207 enterprises in our sample in the period under assessment. As many as 74 % of them preferred this source of funding to finance their long-term business needs, less than 39 % of enterprises financed their short-term needs by means of leasing. 26 enterprises (almost 13 % of those using leasing) used it to meet both long-term and short-term business needs.

Several authors (e. g., Sivák, Belanová, Jančovičová, Bognárová, 2015) argue that lease financing is popular in particular in smaller enterprises. The results of our research also confirm this argument. Leasing is preferred by businesses due to its advantages including the fact that they do not need the full amount of the purchase price to acquire fixed assets, a leasing company does not require a detailed business plan, financial statements are sufficient to document firm’s solvency and no collateral is required. Leasing thus becomes more available than other external sources of finance, mainly for small and young enterprises. The above mentioned low rejection rate related to this type of capital also proves that.

In the second place in the order of the selected debt sources of finance there are advance payments which seem rather beneficial and cheap source of capital for a supplying firm. The same ranking also belongs to subsidies, grants and EU funds. This result contrasts with a very low interest in the use of grants in the EU countries recorded in Table 2. This can be explained by the assumption that in countries exhibiting characteristics of the bank-centred economies, small and medium-sized enterprises make greater use of subsidies and grants, particularly in periods when banks restrict the availability of traditional debt sources of finance (Ferrando, Grieshaber, 2011).

A special part of our research was devoted to the identification of obstacles limiting the use of leasing in the Slovak small and medium-sized enterprises. In accordance with a number of scientific studies relating to the capital structure optimisation, cost of capital is a substantial factor affecting decisions on sources of finance and many authors consider it as one of the most significant factors in this decision-making process. The cost of debt capital is an interest. Despite a generally lower price of debt compared to equity, debt financing can still be rather expensive for some small and medium-sized enterprises since an interest rate is also influenced by such determinants as firm’s risk, its credit history and creditworthiness, lack of assets appropriate to be offered as collateral, etc., which are problematic for many SMEs. The determination of an interest rate is usually a matter of a creditor’s case-by-case approach. Given that and also following the development of credit conditions in Europe, we suppose in the hypothesis 2 that small and medium-sized enterprises established in the Slovak Republic consider the high price to be a main obstacle limiting their decision-making on the use of leasing. To test this hypothesis, we also applied the Friedman and Wilcoxon tests. Table 5 presents the results of this examination.

Table 5: Obstacles limiting the use of leasing in Slovak SMEs

Order	Limiting obstacle
	High price
1.	Ownership risks are born by a lessee
	Limited possibility to terminate a lease contract
2.	Regular payments drain cash flow and may jeopardise firm’s solvency
3.	Stringent requirements of leasing companies
4.	High administrative burden

	Overly lengthy process of its acquiring
	Insufficient supply of products suited to specifics of SMEs
5.	Difficult orientation in the huge amount of information
	Lack of information on existing options
	Reluctance of leasing companies' staff
6.	Incompetence of leasing companies' staff
	Lack of knowledge and skills of firm's managers

Source: Own processing based on the results of the questionnaire survey.

The results in the above table show that Slovak small and medium-sized enterprises consider the high price but also the fact that the owners' risks are born by a lessee even though the owners' rights are held by a leasing company and also a limited possibility to terminate a contract to be the three most pressing problems limiting the more intensive use of leasing. Therefore, **the hypothesis 2 can partially be confirmed as the high price and other two mentioned obstacles are considered of almost the same importance**. This trio of obstacles is followed by other problems discouraging Slovak SMEs from the use of leasing indicated as significant including the risk that regular leasing payments will drain cash flow and thereby jeopardise firm's solvency and stringent requirements of leasing companies. The other obstacles listed in the ranking can be seen as less significant since they were indicated by less than 12 % of respondents. The last three obstacles in Table 5 relate to personal qualities of both partners in the leasing relationship. The fact that they were mentioned only by less than 5 % of respondents can be seen as positive.

It is clear that if small and medium-sized enterprises are to use leasing in their financing, they should know its fundamental characteristics, advantages and disadvantages which determine its adequacy or inadequacy to finance a particular business need. On the basis on the results of our research, we present some **ideas and suggestions to improve and expand possibilities of the use of this source of financing in Slovak small and medium-sized enterprises**.

Small and medium-sized enterprises identified the high price, the fact that the owners' risks are born by a lessee although the owners' rights are held by a leasing company, and also the limited possibility to terminate a leasing contract as the main obstacles discouraging them from a wider use of leasing. The high price of leasing has been conveyed and objected obstacle of its wider use in Slovak SMEs as well as the issue of owners' risks or the possibilities of the leasing contract termination. Also with regard to the situation created by the coronavirus pandemic, dealing with these challenges will require more comprehensive efforts on the part of leasing companies.

Recently, the great majority of enterprises have been closed for various reasons related to the COVID-19 pandemic. Many of them endeavour to agree with leasing companies on lower leasing payments or leasing payment exemptions. Many leasing companies responded to lockdown and closure of enterprises, adapted to changed conditions and started to offer deferred payments to their clients.

On 28 May 2020, the International Accounting Standards Board issued the amendment to IFRS 16 publishing the guidance on accounting for rent concessions provided to lessees due to COVID-19. Since a lessee and a lessor may, as a direct consequence of COVID-19, review the terms and conditions of a leasing contract, both have to consider the IFRS 16 requirements and evaluate whether the rent concession should be assessed as a lease modification or incorporated in timing of payments in later periods. This evaluation has to be made in accordance with the existing terms and conditions of a leasing contract as well as on the basis of the specific terms of the agreed concession, possible asset impairment with the right to use the assets or an underlying asset and in the case of the approved state rent contribution in accordance with the accounting requirements for state subsidies. The subsequent

disclosure of required information in the notes to the accounts so that it is sufficient for the users of the final accounts to understand the impact of rent changes related to COVID-19 on the financial situation and performance of a firm (an entity) is essential.

Other proposals for improving possibilities of the use of leasing in financing small and medium-sized enterprises suggested by respondents include targeted advice provided to this segment of enterprises. They also suggest – particularly in the post-crisis era – to establish information centres in leasing companies specializing in SMEs financing. This would enable to take account of their specificities in a more efficient and targeted way. The small and medium-sized enterprises indicated the failure to make provision for specific characteristics of this segment of enterprises as a problem discouraging the use of this form of financing in SMEs.

Many respondents reported that weak helpfulness and reluctance of the personnel of leasing companies sometimes decreases their interest in the use of leasing. They would hope to see better awareness of the personnel, their increased qualifications, experience and personal capabilities since managers of small and medium-sized enterprises often feel that the employees of leasing companies are not adequately informed about their specific features and problems.

The recommendations directed towards the internal environment of small and medium-sized enterprises concern in particular overcoming the barrier of insufficient knowledge, skills, competences and experience of managers of SMEs in the area of the use of leasing as a source of finance. To address this barrier, there is a need to improve awareness of this type of capital among managers of small and medium-sized enterprises.

5. CONCLUSION

Small and medium-sized enterprises form the backbone of any economy. The impacts of the coronavirus pandemic hit all economic players, but particularly this segment of enterprises. Closure of businesses due to stringent measures during the pandemic has resulted in the reduction of their sales and liquidity problems. The question is to what degree will small and medium-sized enterprises be able to launch their economic recovery in the after-crisis period, to what degree will they be able to restore and restart their activities. However, more than ever before, they are in need of help, creating the appropriate conditions for their recovery to overcome the consequences of the COVID-19 crisis. Hence, leasing appears as an appropriate source of financing of this business segment.

The results of our research confirm that leasing is a popular source of funding and in Slovak small and medium-sized enterprises, it is the most often used source of capital among debt sources of finance which do not include bank loans and trade credit. On the other hand, however, we have identified that SMEs face many obstacles limiting their decisions on the use of leasing. Therefore, we formulate several ideas and proposals seeking to improve and expand the possibilities of the use of this type of capital in Slovak small and medium-sized enterprises. We believe that recommendations hereby may help this objective to be met.

Abstract: The paper aims to present the application of an escalation matrix in operational risk management in the international retail company IT departments. The peculiarities of the escalation as a process opposite to the delegation of responsibilities and as part of the so-called Management by Exception approach are considered.

Special emphasis is placed on the circumstances in which this tool is an appropriate and effective mechanism for solving a problem. The necessary conditions for its creation are described. Conditions in which escalation management is undesirable, especially by project managers, are displayed.

An author's model of escalation risk management is attached. Based on the case study approach, the roles of the participants in the escalation matrix are described. The methods used are mapping, description of the roles, case study. The connection with the agile management of teams is displayed as a necessary condition for successful escalation in case of an organizational problem.

Keywords: Escalation management, Escalation matrix, IT projects, agile management

1. INTRODUCTION

The term escalation comes from the Latin "scala" (ladder) (Rosseger, 2021). According to the Cambridge Dictionary, escalation is defined as: "a situation in which something becomes greater or more serious" (Cambridge Dictionary). The term is usually used in a negative context when tensions increase in connection with a conflict, problem, etc. In business, the escalation is associated with a serious increase in costs due to rising inflation. In American law there are the so-called. an escalation clause according to which employees' salaries should be adjusted if inflation rises higher than expected.

In project management, escalation is increasing the importance of a business-related activity or moving a task to a higher level in the organization. For example, if a team realizes that the problem has become much larger or involves more resources than previously planned, the manager may escalate the problem to a higher department or person in the organization. The escalation is generally related to a change in priorities due to a change in the conditions of the project during its implementation.

In the present study, the escalation is considered in this - business and organizational sense, and not in the context of conflict management.

The paper aims to present the application of an escalation matrix in operational risk management in the international retail company IT departments. The peculiarities of the escalation as a process opposite to the delegation of responsibilities and as part of the so-called Management by Exception approach are considered.

2. LITERATURE REVIEW

Escalation as an approach to operational risk management in IT projects is mainly associated with the efforts of researchers to determine the reasons for success or failure of a project, as well as ways to respond rationally in different situations. (Guah, 2008)

Rosseger describes the process of escalation in project management as "a procedure that determines in which situation, who, in what form and with what preparatory work conveys the decision to which next higher level of the organizational hierarchy". (Rosseger, 2021) Tanja Hupf and Turgay Sahin present an escalation matrix based on the RACI matrix and the Input-Output approach. In this case, the roles

(Responsible, Action, Support and to be Informed) refer to the four phases of escalation: 1) preparation, 2) implementation, 3) follow-up, 4) completion. (Tanja Hupf, Turgay Sahin, 2016)

Applied to the project context, escalation is usually a formal process for highlighting the issue in question to a higher authority according to the escalation mechanism defined for the project.

Escalation as an approach is invariably linked to the iron triangle rule, according to which project managers comply with the three constraints in project implementation: budget, scope and schedule. (Tanja Hupf, Turgay Sahin, 2016)

Escalation management can be done through instruments within the scope of operational risk management.

In general, they concern solutions (Rosseger, 2021):

- With a prospective character - for prevention of future problems
- Current - to overcome problems at the moment
- In retrospect to mitigate problems that have already occurred.

The escalation is the opposite of delegating responsibilities and tasks. As a process, the escalation is related to the realization of the so-called Management by Exception (Angermeier, 2017).

In a broader sense, escalation is part of the decision-making process and in this sense it combines different aspects of the interaction of managers (decision-makers) with the environment. (Adinolfi, 2021). In this sense, the surest approach to limiting escalation in a project is the correct and reasonable setting of goals (Lee, JS, Keil, M.; Kasi, V.), which are SMART.

The escalation matrix has been successfully applied in sectors outside IT. For the purposes of expeditious lending in the banking sector, a similar approach has been applied by applying the Hierarchical Timed Colored Petri Net (HTCPN) based model. It stimulates the intelligent agents system, which provides automatic credit monitoring of customers in banks. (Ben Mnaouer, A., Wanis, M., Aloqaily, M., 2019)

There are many reasons for using tools to control the escalation process. These can be incorrect descriptions of the roles in the project implementation process, hence - communication problems arising from these roles, conflicting goals regarding costs, time and quality, technical delays, missed service level agreements and others.

The most basic example is if a certain participant in the project does not want or is not able to perform a certain activity for which he is responsible, it is necessary to escalate the issue of the permit manager.

Risks or issues related to project objectives, conflicts between resources and between groups, unclear roles and responsibilities, disagreements within the scope, dependencies on third parties are some known situations that require escalation. Such problems require higher-level intervention because many times the authority, decision-making, resources, or efforts required to resolve them are beyond the horizon of the project manager. Sometimes the project manager may want to involve senior escalation authorities only with information to keep them up to date with potential problems in the project. Understanding the proper use of escalation techniques is vital for project managers. Ескалацията е формален механизъм, чрез който мениджърите на проекти трябва да овладеят критичен проблем, за да разрешат ефективно „тесните“ места по проекта. Много пъти обаче мениджърът на проект се колебае да ескалира въпроса, като някои от основните причини са (A Guide to Escalation in Project Management, 2018):

- Escalation is a creator of immediate conflicts and clashes, as it is perceived as a complaint against the person involved in the problem.
- Escalation sometimes leads to a counterattack, as people tend to accept the escalation personally rather than professionally. Therefore, team members are reluctant to escalate for fear of reaction or anger.

- Some project managers experience ego issues when escalating a problem or communicating project risks.
- Some project managers prefer to deal with the problem by using available resources for too long before asking for help (assuming they can solve it themselves).
- Junior or new project managers will not dare to escalate against experienced team members, senior management or people on the client side.
- The escalation builds a perception that the project is out of control and the project manager is unable to manage it.
- Some project managers do not know how to use the escalation mechanism to solve the problem.
- The Project Management Office has not created a general escalation plan or no specific escalation plan at project level. However, escalation is needed if the issue is not resolved in time and the delay affects other project activities.

Escalation must be treated as a professional act and must be carried out in an effective manner. Project managers should escalate in a timely manner if something blocks the project and is beyond the control of the project manager. (A Guide to Escalation in Project Management, 2018) This approach to work brings escalation closer to agile project management insofar as it is characterized by greater autonomy of teams in decision-making of an operational nature. As it moves from a lower to a higher level, the escalation process requires a flexible organization of project management, so that low levels have the opportunity to raise the issue of the growing problem in time, while finding the most appropriate form and adequately address the solution. .

At the same time, the escalation fits into the hierarchical model of the organization, as it signals higher levels of management for the presence of a problem that requires an urgent solution. Proactive escalation and risk communication is far better than unpleasant surprises requiring costly project adjustments.

3. ESCALATION MANAGEMENT CASE STUDY

3.1. Company description

This report examines a model for escalation management in the IT department of an international chain of hypermarkets specializing in the sale of FMCG in 8 countries in Europe.

The tasks of the department are related to the development, management, distribution and implementation of new software solutions for scales in hypermarkets in all countries where the company operates. The whole process of creating and distributing the software to users (individual hypermarkets) is under the common name roll out. In essence, this is an innovative process, as there are continuous improvements in customer service, according to the company's announced policy of "exclusive focus on quality - as a range, as a service, as a complete customer experience, as relationships with partners and overall business conduct".

The main problem faced by the IT team is that the process of knowledge transfer for project management and processes in the company is not completed. This led to day-to-day business issues that required more than the required response time, and this reflected on the scope of work and time and performance (which are two of the three components of the iron triangle).

In the following months, questions gradually arose regarding the delegation of responsibilities, tasks and contact persons between the teams inside and outside the company. The lack of clear tracking of the set tasks and the emerging new ones complicates the work process to the extent that their implementation becomes impossible. Ineffective communication channels, caused by organizational and language barriers and lack of cohesion, have an adverse effect and take teams out of the pre-course.

3.2. Development of Escalation matrix

To create an effective escalation matrix, two things are needed in the beginning: a clear definition of the problem and knowledge of its solution. This is how we start creating an escalation matrix based on the principle Familiar problem - known solution.

As the time spent in the company progresses, the team members define two main points necessary to increase the success of the realization of the required by the management to the IT team, namely -

- development of process management which is coordinated, coordinated and approved with the company's headquarters in Germany and with each country (ESKA matrix)

- Knowledge Base

A plan for the development of an ESCA matrix is drawn up, which provides for a three-month period of design, coordination, adjustment and implementation of the model.

For the development of the first working version of the ESKA matrix, working meetings were held with representatives of the management of the IT departments in the branches of the company, each country separately in order to understand in detail the work processes of the teams in terms of time factor. Preliminary meetings last one month.

Due to the huge amount of information that needs to be processed to compile an escalation matrix with the roles and responsibilities of the participants, the working team summarizes and creates a second option, adhering to the following points:

- Analysis of the main reason for escalation

- Prioritization of problems / from 1 to 3, where 1 is extremely important and 3 needs to be completed within 10 days /

- Configure Conditional / Force Majeure / SLA policies

- Set reminders before SLA deadlines.

Having all the information regarding the work processes in each country where the company operates and the set points and their approval, an extended team with the participation of representatives of IT departments in the company's branches in each country, develops for one week the current escalation matrix of the company. which is currently being worked on.

The model is a combination of processes, provides flexibility at a time when a quick decision needs to be made, and provides a multi-person feedback platform for each party currently affected.

In general, the model can be visualized as follows:

- This report examines a model for escalation management in the IT department of an international chain of hypermarkets specializing in the sale of FMCG in 8 countries in Europe.

- The tasks of the department are related to the development, management, distribution and implementation of new software solutions for scales in hypermarkets in all countries where the company operates. The whole process of creating and distributing the software to users (individual hypermarkets) is under the common name roll out. In essence, this is an innovative process, as there are continuous improvements in customer service, according to the company's announced policy of "exclusive focus on quality - as a range, as a service, as a complete customer experience, as relationships with partners and overall business conduct".

The main problem faced by the IT team is that the process of knowledge transfer for project management and processes in the company is not completed. This led to day-to-day business issues that required more than the required response time, and this reflected on the scope of work and time and performance (which are two of the three components of the iron triangle).

In the following months, questions gradually arose regarding the delegation of responsibilities, tasks and contact persons between the teams inside and outside the company. The lack of clear tracking of the set tasks and the emerging new ones complicates the work process to the extent that their implementation

becomes impossible. Ineffective communication channels, caused by organizational and language barriers and lack of cohesion, have an adverse effect and take teams out of the pre-course.

3.2. Development of Escalation matrix

To create an effective escalation matrix, two things are needed in the beginning: a clear definition of the problem and knowledge of its solution. This is how we start creating an escalation matrix based on the principle Familiar problem - known solution.

As the time spent in the company progresses, the team members define two main points necessary to increase the success of the realization of the required by the management to the IT team, namely -

- development of process management which is coordinated, coordinated and approved with the company's headquarters in Germany and with each country (ESKA matrix)

- Knowledge Base

A plan for the development of an ESCA matrix is drawn up, which provides for a three-month period of design, coordination, adjustment and implementation of the model.

For the development of the first working version of the ESKA matrix, working meetings were held with representatives of the management of the IT departments in the branches of the company, each country separately in order to understand in detail the work processes of the teams in terms of time factor. Preliminary meetings last one month.

Due to the huge amount of information that needs to be processed to compile an escalation matrix with the roles and responsibilities of the participants, the working team summarizes and creates a second option, adhering to the following points:

- Analysis of the main reason for escalation

- Prioritization of problems / from 1 to 3, where 1 is extremely important and 3 needs to be completed within 10 days /

- Configure Conditional / Force Majeure / SLA policies

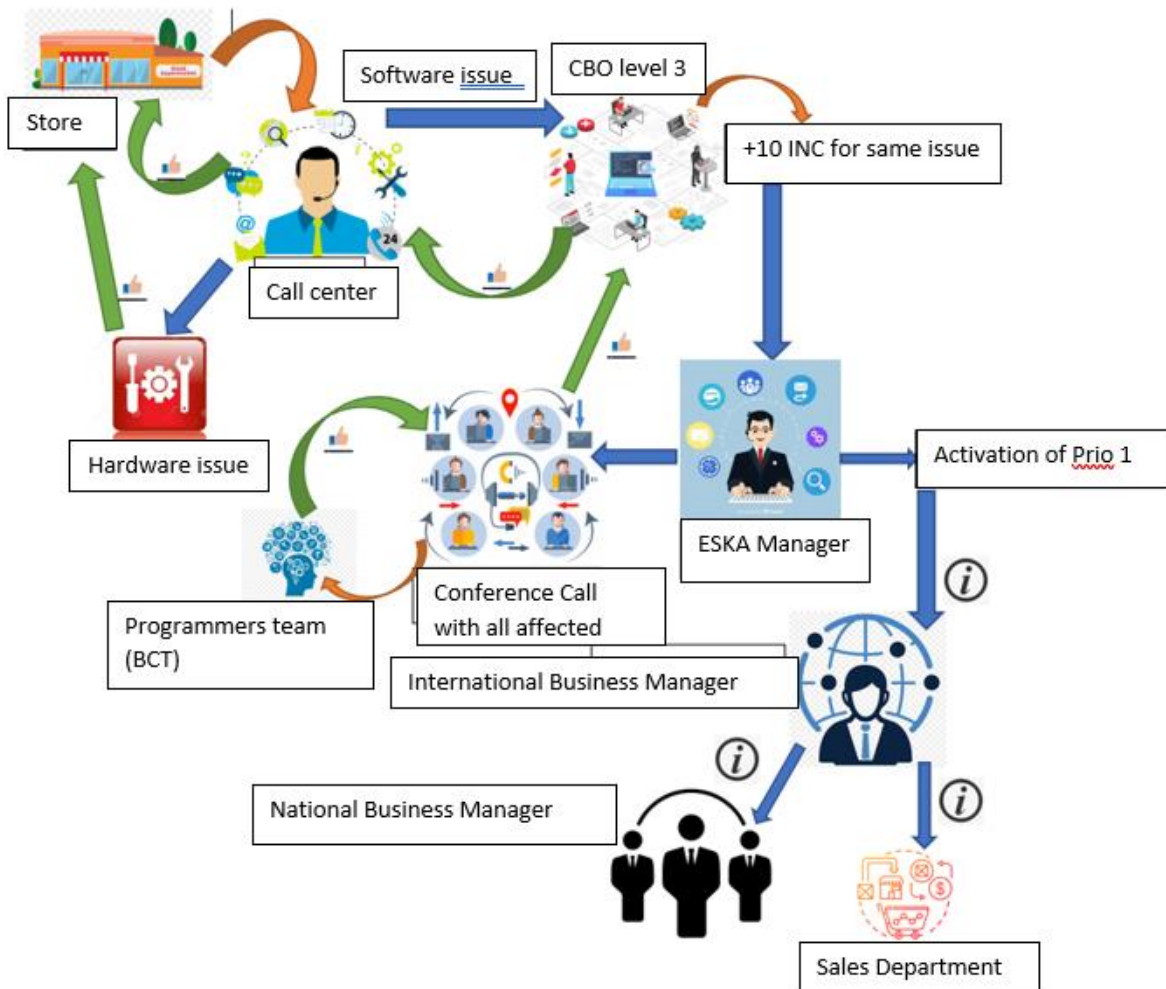

- Set reminders before SLA deadlines.

Having all the information regarding the work processes in each country where the company operates and the set points and their approval, an extended team with the participation of representatives of IT departments in the company's branches in each country, develops for one week the current escalation matrix of the company. which is currently being worked on.

The model is a combination of processes, provides flexibility at a time when a quick decision needs to be made, and provides a multi-person feedback platform for each party currently affected.

In general, the model can be visualized as follows:

Figure 1: Communication model when a problem escalates.

The roles of the participants in the escalation matrix are defined as follows:

Level 0 Store (s). They have a problem related to the software part of IT, they call an internal short number / IPT - Internet phone / of the call center, trying to be as comprehensive as possible regarding the problem.

Level 1 Call Center (SD). They have a very large range of work, but with limited access. SD's main task is to make the highest percentage of FCR / First Call Resolution /, ie. to realize the largest number of closed incidents during the call without forwarding the problem / Routing /. In case they cannot solve the problem during the call and implement FCR, SD should gather as much information about the problem as possible. In order to facilitate and universal communication, the team also develops templates for the top 10 most common problems with which SD agents can more quickly, easily and efficiently gather the necessary information for a specific problem.

Level 2 -Field Support (local IT). Prior to the introduction of the Escalation Matrix, Level 1 and Level 2 were merged into one and very often had difficulties in the form of lack of knowledge or too much knowledge. The role of level 2 at the moment is related to performing technical support on site with all IT related problems that are not relevant to the software, ie. the hardware part - printers, network, setup and calibration of devices, etc.

Level 3 -CBO (Central Business Organization) In general, the work at this level can be framed as follows:

- Ensuring work (one of the IT principles)

- Incident and problem management
- Communication with decision teams
- Analysis and error handling
- Monitoring of data processing and availability
- Communication with departments (PnM, EK, BST)
- Contact with SD in all countries
- Training materials for SD in all countries
- Work on various projects - personalization and distribution
- Composite tests (stress tests of the systems)

The team also exchanges knowledge with BST. The CBO is also responsible for providing a solution to the problem within 15 minutes to 1 hour depending on the priority or making a referral to the responsible team. It is also his responsibility to notify Business Impact Manager nationally when there is a problem affecting more than 10 stores with the same replicating problem.

Level 4 BST (Business Solution Team) or BCT (Business Controlling Team). This team consists of four people - two programmers and two economists. Their role is to develop software and anticipate its impact on the system (software) and users. Works in close communication with level 3. Level 4 is responsible for introducing level 3 in any novelty (update) or distribution (Rollout) before it has even entered a test environment, while providing complete, specific and accurate information on in terms of how it is coming, how it will happen and the most important part - how it works.

Level Management. Responsible for opening incidents with priority 1, organizing the so-called Telko / group calls for information and decision-making / and controlling every 15 minutes from the start of priority 1 incident.

4. CONCLUSION

In the current modern and rapidly developing theory and practice, a universal model has not yet been created that is applicable to all (teams, projects and corporations). It is an indisputable fact that governance models are constantly evolving in order to respond to dynamic events that are an integral part of our daily lives.

Presenting and implementing an Escalation Matrix is not a new model and does not solve all the difficulties, but framed in a flexible management model with pre-drawn, precise and clear criteria, it would be useful for the team (organization) at different levels.

One way to manage escalation at the corporate level is to attract additional consultants (internal or external) to identify the potential problem relatively early and propose a solution. (Loh, CY, Coyte, R., Cheng, MM, 2019) External consultants are less concerned and can more freely express their concern about the problems in the organization by offering unpopular solutions.

The management of the Kovid-19 crisis can essentially also be attributed to escalation management. The various countries, mainly on a trial and error basis, have in practice developed their own escalation models and a matrix of the roles of the participants in crisis management. How successful they are will be shown by additional analyzes later.

The escalation matrix can be further developed in a number of sectors and in the context of different types of organizations. In order to maximize the effectiveness of its introduction, it is necessary to use гъвкава методология на управление, тъй като матрицата обикновено се напасва на няколко етапа с активното участие и дори по инициатива на отделните екипи.

Abstract: The paper considers the possibility of using the employer brand as a tool for attracting qualified employees in the

information technology sector in Bulgaria. Finding qualified staff is a challenge faced by a large number of employers in the

IT sector, which is highly competitive in Bulgaria.

This research will take onto consideration the main elements that are included in the employer branding strategy and definition of the main terms. The focus will be the impact of the employer branding process in attracting and selecting staff.

Will be observed in both parts, external and internal employer branding and the tools that are used to implement ing

information technology companies. The study examines the extent to which the presence of a developed employer brand and its active promotion is known as a tool for recruitment and retention (external and internal employer brand) and what strategies for its promotion are applied in the IT sector in Bulgaria.

The research method is in-depth interviews with specialists in the different human resources departments in IT companies

in Bulgaria, who will share their experience and practices. The results of the study also show the direction in which the employer brand should be developed as a tool for attracting qualified employees in the information technology sector.

Keywords: talent management, employer branding, employee value proposition

1. INTRODUCTION

The development of the technology sector worldwide has led to the rapid development of innovations and information systems, which have taken a central place in various industries. As a consequence of this technology growth, a knowledge economy became more valuable. The main focus of the knowledge economy is human capital, which is the main driving force of modern society. All these factors together create a competitive labor market between IT companies in different companies. In the annual survey of BASCOM (industry association of leading Bulgarian software development companies), (BASSCOM., 2020) which is based on information from over 4400 companies, the software sector remains one of the most desirable among young professionals. According to the survey, jobs in 2020 increased by over 3500, but the growth of employees in The sector is slowing down, which is one of the proofs that the demand for staff in this sector is higher than the required number of employees at the moment.

The need for highly educated and experienced profiles motivated companies to start searching for new strategies and ideas, how to be more attractive for potential employees.

The employer brand is a relatively new tool, which in recent decades has become a prerequisite for organizations wishing to be competitive in the labor market. Reputable employers have a significant advantage in hiring better candidates, and also optimize the cost of hiring new employees.

On the other hand, career development and finding the right environment and culture become part of the factors that determine the choice of employer. This is because work has become one of the main

parts that people use to define themselves. The desire and search for identity as well as the sense of belonging to an organization play an important role in the search for an employer. This increases the desire for cooperation, teamwork, participation in decision-making, and development within the company.

The study examines the extent to which the presence of a developed employer brand and its active promotion is known as a tool for recruitment and retention (external and internal employer brand) and what strategies for its promotion are applied in the IT sector in Bulgaria.

2. LITERATURE REVIEW

In theory talent management system have different stages, but generally they can be summarized:

- selecting
- development
- management
- retaining/ compensation

Based on Armstrong's definition "Talent management is the process of ensuring that talented people are attracted, retained, motivated and developed in line with the needs of the organization". (Armstrong, 2007)

A talent management system logically begins with attracting specialists and hiring them. Alan Price (2007) in his work "Human Resource Management in a Business Context" formally defines recruitment and selection as a process of and attracting suitable candidates for employment. He states that the recruitment process is not a simple selection process, as it needs management decisions and extensive planning to recruit the most suitable workforce. (Price, 2007)

It is common in the selection of staff to focus on vacancies, which must be filled with the appropriate profiles. The recruitment process often begins with the emergence of a vacancy in the organization. Companies usually publish a job advertisement, which is based on the position and the necessary professional qualities, knowledge, and skills. Candidates who largely meet the necessary criteria go through a selection process, which is defined by the respective organization, according to the company's culture, technical requirements, and expectations of managers and teams. In general, this is a reactive introduction of companies that process hiring starts only when there is an internal need (vacancy). As the demand for staff in a given market increases, companies rethink their selection strategy and move to active actions to attract the right staff. In this part of the talent management system, marketing tools are often used. The aim is to create a positive image of the company or the so-called employer branding.

According to P. Kotler and Armstrong a brand is "name, term, sign symbol (or a combination of these) that identifies the maker or seller of the product (Kotler, P., Armstrong, G., & Cunningham, M. H., 2005)

From Kapferer perspective brands are a direct consequence of the strategy of market segmentation and product differentiation. Branding means more than just giving name and signaling to the outside world that such a product or service has been stamped with the mark and imprint of an organization. Branding consists in transforming the product category; it requires a corporate long term involvement, a high level of resources and skills. (Kapferer, 2004)

Employer branding as a term was first used by Simon Barrow and Tim Ambler. They described the term as "a package of functional, economic and psychological benefits provided and identified in the company (Ambler, Tim Barrow, Simon, 1996/12/01) Another definition of the process of developing an employer brand is given by Backhaus and Tikoo: Recognizing the importance of product and corporate brands, they focus branding on human resources and call employer branding "the application of branding principles to human resource management. (Backhaus & Tikoo., 2004)

Recognizing the importance of product and corporate brands, they focus branding on human resources and call employer branding "the application of branding principles to human resource management". (Kristin Backhaus; Surinder Tikoo, 2004)

According to Backhaus, branding companies as employers is a relatively new recruitment practice, based on which is to promote the creation of a unique and attractive image of the company as an employer. (Backhaus & Tikoo., 2004)

Chartered Institute of Personnel and Development (CIPD) determine an employer brand "... a set of qualities and conditions, often intangible, that distinguish an organization that promises a certain type of professional experience that is perceived by people who will develop and achieve results with the conditions of its culture ". (CIPD)

The following can be summarized as the main benefits of the employer brand:

Distinguish among other employers in the market. Opportunity to attract the best professionals.

Increases the efficiency of the recruitment process. The employer brand also increases employee engagement and motivation.

The main part of the employer brand is the value proposition, the value proposition that is offered to the employee (employee value proposition). It most often includes the tangible and intangible benefits that the employer provides to employees. DiVanna gives an initial definition (EVP) as a portfolio of skills and experience that can be considered as assets and included in the company's balance sheet. (DiVanna, 2003)

The main role of the employee value proposition (EVP) is to provide a platform for communication with the brand, for example in support of a communication campaign. But more and more EVPs go beyond the communication level and become an integrated tool for people management. (Mosley)

The correct formulation of the value proposition provides the business with the following benefits:

- Effective undercutting
- Reducing the turnover of employees in the company
- Increasing job satisfaction
- Increasing the productivity of teams and individual employees

In order to successfully build a value proposition, it is necessary to take into account the expertise of various departments such as legal, human resources, marketing and research among employees and the market.

The employer brand is important for the company as an employer because it has a direct impact on how it is perceived by potential employees looking for work and reflects the status of the labor market.

3. EFFECTIVE EMPLOYER BRANDING TOOLS

To see what the employee value proposition is at the moment, we took from one job board (dev.bg/ May 2021) five different IT companies that are looking for Java developers with a similar profile at the moment.

We divide the benefits section into several categories:

- Paid vacation day
- Food vouchers
- Additional Health insurance
- Wellness, sport
- Office conditions
- Learning and development
- Home office
- Career development
- Other

Companies' employee value proposition, including different factors and benefits, should convince the candidate to accept a job offer. Weigh salary and benefits are major points in job propositions. In this

study we cannot analyze salary, because this is confidential information that companies rarely discuss in public. But we can see in the table other material or financial benefits such as additional medical insurance, food vouchers, and sports cards, etc.

Companies also paid attention to learning and career development. Instead of focusing on what a person can do for the company, organizations also take into consideration what kind of professional and personal development they can provide. Examples from job advertisements show that for IT companies Individual learning budget, internal and external technical and soft skills training, leadership programs, language classes and knowledge sharing is something already common on the market. It can be principal for the person to know in advance what type of career goals he or she can achieve, what are the opportunities for growth, can she/ he learn new things, and develop professional skills.

During the hiring process recruiters and managers in different companies include in the interview questions that should discover cognitive abilities, professional knowledge, and cultural fit. Working atmosphere and culture are also important for future employees. This criterion is hard to define and systemize, because of the diverse understanding of a “good working atmosphere”. Still, in job advertisements, employers make a point on exchange with colleagues, charity and volunteer activities, hackathons, etc. Work-life balance and flexible schedule/ home office can be added also to the healthy working environment. The chance to manage your working time is one of the most attractive benefits for the candidate. That is the reason regularly to be mentioned in job offers. Employer branding is common in sectors that are in a period of growth and are in high demand for employees while making efforts to retain employees. Companies that are stagnant stage have different type of challenges and their efforts are focused in another direction.

4. EMPIRICAL RESEARCH OF THE IMPACT THAT THE EMPLOYER BRAND HAD ON RECRUITMENT

To examine the potential impact of the employer's brand on hiring, a qualitative study was conducted through individual interviews. An online interview questionnaire was sent via LinkedIn to human resources specialists in IT companies in Bulgaria. Questionnaire consists of six questions. Five of them are open and one is with an option to choose from.

The purpose of the questions was to establish:

- to what extent the HR experts in the surveyed companies are familiar with the term employer branding
- whether they have a specialist or agency to develop the employer brand and if so, to which department does it belong (Marketing, human resources, public relations)
- to get the opinion of the respondents about what are the main benefits that the employer branding brings to the organization
- whether they have an employer branding strategy and to what extent the development of a strategy and its implementation will help to attract and retain staff
- whether the company in which they work applies an internal employer branding
- identify the types of employer branding channels in their organization, listing several possible channels

The questionnaire was filled by eleven human resources specialists in different IT companies in Bulgaria.

In general, all respondents agree with the idea that employer branding is a necessary tool for achieving organizational goals. Almost everyone is aware of the ideas of the concept, but its interpretation is mainly focused on the selection of new staff, not so much on their retention.

Confirmation of this hypothesis is to some extent the answer to the question "What are the main benefits that employer branding brings to the organization? Ten out of all 11 respondents (91% of the answers) concern the recruitment of new staff as a priority. Only one of the respondents includes, in addition to hiring new staff, also a positive attitude towards the team, which makes a reference to the employees of the company.

According to the answers, the HR department in the current situation on the market is more focused on the challenge to hire new colleagues in the company.

The answers to the question of whether internal employer branding is applied in the companies of the respondents are interesting. Here, two of the respondents (18%) answered in the affirmative, three (27%) - that efforts are now being started and are being made, and the rest - over 50% answered that they cannot judge or do not answer this question. This clearly shows the priority orientation of the companies under study to the development of the employer brand, primarily to recruitment, with an emphasis on attracting talent (as noted by one of the respondents). However, the internal employer brand, which is aimed at current employees, remains in the background.

According to the question “Do you have a specialist or agency to develop the employer brand? If yes to which department does it belong (Marketing, human resources, public relations)” results show that employer branding is still the priority of human resources. Also, external marketing agencies are regularly used as supporters.

Fig.1. Distribution of the respondents to the question who is responsible for the development of the employer brand

These differences in responses indicate that the surveyed companies have different views on the organizational aspects of employer brand management. It is obvious that this task can be entrusted to different departments, depending on the vision of the company for how the process will be carried out. All of the respondents shared that employer branding strategy is extremely necessary and can lead to the fulfillment of the goals of hiring and retaining talent. The general part of them agreed that it affects the recruitment process, according to reducing costs and time for hiring. Regarding the channels for the promotion of employer branding - social media dominate, indicated by all respondents as the most widely used. Professional Platforms, Recommendation by Current Employees are also popular. Relations with higher education institutions, the implementation of Job Search Platforms, and Recruitment Agencies have the same weight - 45% each. The least popular are the events - only 27% of the respondents.

Fig.2. Types of employer branding channels in organizations.

The conclusions discovered by the study can be summarized in several points:

- Undoubtedly, the concept of the employer brand is understandable and popular among the experts from the HR departments in the IT sector in Bulgaria. The reason for this is the current situation in the sector, which is growing with prospects for even greater expansion and needs talented and trained staff, the supply of which is limited in the country. It is no coincidence that various new training organizations are emerging to help this process, trying to fill the shortage of staff. This environment unconditionally stimulates the development of additional tools for attracting and retaining staff, united by the concept of the employer brand.
- The focus of companies is mainly on recruitment (external employer brand) and less on the internal employer brand related to staff retention. This assumption in the present study may stem from the profile of the respondents themselves, who are focused mainly on recruitment and not so much on staff retention.
- There are differences in how to apply the employer brand in different companies, and this can be done by different departments depending on the organizational profile.
- Communication channels are virtually all possible, dominated by social media and recommendations from current employees (word of mouth marketing) and professional platforms.

4.CONCLUSION

In the last years, employer branding took a more visible place in the talent acquisition process and it became familiar to recruiters and marketing experts. Employer brand is one of the pillars of a company's reputation. How an organization is recognized by candidates can be a key factor in the hiring process.

Nowadays, employer branding is still a new field in human resources, but it has a big potential to expand. The role that it plays at the moment is more connected to the entering part of the recruitment funnel, but it affects generally costs and the timeline of hiring. Next years, the staffing process will be more oriented to the employee experience and working environment. For example, if an organization is representing itself as a learning- oriented organization with the opportunity to exchange ideas with professional colleagues, every step of the staffing process should be based on this idea.

In the same way, if positioning itself as a place for new ideas and out of the box thinking candidates should expect a more creative and challenging interview process. Employee value propositions should be clearly defined and easy to understand, one side by potential candidates and from the other side by current employees on different levels. Transparent presentation of company values and goals will help future candidates to make informed choices that reflect more on their own professional goals and principles.

It is hard to create generic employer branding strategies that will work efficiently in different situations and companies. In the current competitive market for talents, it is important to find the unique face of the company as an employer. The message that companies send to the potential candidates, should be accurate and comprehensible. In the future, employer branding will continue to evaluate as a human resources tool that will lean on a dialogue between employer and employee.

The current study is of qualitative characteristics and in this sense, its aim is not so much to draw key conclusions about established trends but to bring to the fore key issues around the topic of the employer brand. Many open questions remain, such as: how the brand affects potential candidates, what is the situation in other sectors of the economy that are in different states, what other tools can be applied to strengthen the internal employer brand, how to successfully integrate it into company strategy, etc.

Abstract: In Greek society, as in many other modern European countries, an aggravation regarding social inequalities and gender discrimination in the workplace can be found. Though in recent decades there have been legislation settings, concerning both the issue of gender equality and that of combating the discrimination of this inequality in the workplace, even in the public sector, the results are not the expected ones. In the field of education, which is traditionally an attractive workplace for women, inequality between male and female employees is greater in all positions of responsibility, in favor of men, starting from the lowest hierarchical levels till the highest levels. In this article, a research is conducted as a case study, in the primary and secondary schools of the Region of Thessaly, Greece, which will concern the current school year 2020-2021. The quantitative recording of the data of working men and women both in school – the educational workplace – and in its administration will highlight the extent to which the work act has been harmonized with particularly positive legal regulations regarding the representation of women in positions of responsibility. This will be followed by an attempt to record key institutional changes related to gender equality policies in the workplace of education and the article concludes with an attempt to interpret the low representation of women in the work field.

Keywords: female leadership, education, legislation settings, low representation.

INTRODUCTION

This paper examines the presence of working women in positions of responsibility at all levels of primary and secondary education in the region of Thessaly, where the Regional Directorate of Primary and Secondary Education is based. This supervisory body reports directly to the Ministry of Education and Religions and has under its roof four regional units, Larissa, Magnesia, Trikala and Karditsa. They number more than 1,000 school units of both levels of education, namely 778 primary schools and 244 secondary schools with more than 10,000 teachers of all specialties and 97,500 students.

The methodology that will be followed is the case study in the specific region. First, the mechanism of the Greek state that is applied to implement the support policies for gender equality is recorded. This is followed by a mapping of the number of working men and women and their numbers in respective positions of responsibility per regional unit and per type of school, e.g. kindergarten, primary school, high school, general and vocational high school with a specialized record concerning in special education schools. The recording is completed by capturing the respective employees and positions of responsibility in the education administration of the region of Thessaly at all levels, from the position of Regional Director and Directors of Education to supervisors. The percentages of the employees reflect the gender in relation to the total of the employees while the percentages in the positions of responsibility derive from the participation of the gender in relation to the total of the positions of responsibility in general and specifically. Of particular interest in drawing conclusions is the registration, where possible, of the candidates for the respective positions of responsibility. All the data correspond to the state of education in the region of Thessaly in April 2021 and have been drawn from the

“myschool” application of the Ministry of Education. The ranking tables of the candidates and the selection decisions are available from the website “DIAVGEIA” and correspond to the period of the most recent announcement of the positions of responsibility.

1. THE ADMINISTRATION OF EDUCATION

The educational sector as a workplace and especially at the level of primary and secondary education examined at the present paper, presents the specificity of the female-dominated profession and therefore it is very interesting to examine the presence of working women in positions of responsibility.

During the most recent (2019) selection of the Regional Directors of Education by the Ministry of Education and Religions (YPAITH) the absence of women was shocking, as out of the 144 candidacies only 39 (27%) were submitted by women against the corresponding 105 (73%) applications of their male colleagues. The percentage of participation in this process decreases during the selection, as from the 13 national positions only 2 (15.4%) are filled by women and the other 11 positions by men (84.6%) (Ratification list of PDE 2019; Appointment of PDE, 2019). Similarly, during the recent selections of the Directors of Education (2020), although the relevant ranking tables of the candidates were not published by the Ministry of Education and Religions in order to obtain valuable data on the number of candidates, they were submitted, according to publications (source: www.esos.gr; www.alfavita.gr), 572 applications in total for 116 positions of Directors of Education. The selection (Appointment of the Directors, 2020), however, reduced women to 29.3% of the total positions by assuming the respective duties of 34 women and elevated men to a respectable percentage of 70.7% by placing them in respective 82 positions.

Regarding the selection of the Directors of the school units and the other executives of the education, such as the Coordinators / of the Educational Project, the Heads of Educational and Counseling Support Centers (KESY), but also of the Heads of the administrative services, various laws were applied which specialized and focused on selection criteria, keeping pace with international trends as follows: a) in scientific-pedagogical competence, b) in administrative, service experience, c) in personality and d) in the evaluation of candidates based on their course in the workplace of education. The last criterion due to the absence of evaluation in the Greek educational system, was logical not to exist and consequently was not applied in the appointments of 2002, 2007 and 2011, while with Law 4327/2015 the contribution e.g. in the educational work of the Principals was included in the criterion of personality and consequently was judged by the teachers' association through secret ballot (Kakkos, Pitsiavas & Papalexis (2017) ; Frosi, 2017).

According to the most recent appointments (2015) of the Principals of the school units and the respective ranking tables and selection decisions, the picture in the region of Thessaly, with a total of over 1,000 schools in which more than 10,000 teachers serve and about 97,500 students / three (source: pde.thess.sch.gr), is imprinted as following.

1.1. Primary Education

Table 1: General Education Kindergartens

Regional Unity	Nr of School Units	Employees		Principals		Heads of Kindergartens		Assistant Principals	
		male	female	male	female	male	female	male	female
Larissa	114	5	294		4	1	106		3
Magnesia	115	5	319			1	113		
Trikala	87	3	199				86	1	2
Karditsa	69	3	179			2	65		
TOTAL	385	16	991		4	4	370	1	5
		1,6%	98,4%		100%	1,1%	98,9%	16,7%	83,3%

Table 2: Special Education Kindergartens

Regional Unity	Nr of School Units	Employees		Heads of Kindergartens	
		male	female	male	female
Larissa	4	3	27	1	3
Magnesia	3	1	8		3
Trikala	1	1	4		1
Karditsa	1		6		1
TOTAL	9	5 10%	45 90%	1 11,1%	8 88,9%

Preschool education is of particular interest, because it is a completely female-dominated sector, where working women make up 98.4% of the workforce and are then represented by 98.9% in respective positions of responsibility. The situation is similar in special education, where the percentage of male kindergarten teachers is increased to just 10% with a corresponding representation of gender and staffing of supervisors at 11.1%, but remains disappointingly low. The percentage of male presence in special education is increased compared to general education as in special education kindergartens because there are other specialties besides kindergarten teachers. However, it should be noted that 1 head of special education for men is 20% of a total of five employees, while the corresponding percentage in general education is around 25%. The corresponding percentage in 991 working women in relation to the heads is 37.3% while in special education only 17.8%.

It is worth noting that in preschool education, however, with the existence of relatively small school units in the region of Thessaly, the managerial positions are in a total of 385 school units only 4, as 4 are four-seat kindergartens resulting in the vast majority of working kindergarten teachers hierarchically low positions of responsibility of heads while the senior hierarchical positions of directors should be limited to a minimum and be filled entirely by women. Even the total number of assistant directors / positions is 6 positions higher than the directorial positions.

Table 3: Primary General Education Schools

Regional Unity	Nr of School Units	Employees		Principals		Candidates		Assistant Principals	
		male	female	male	female	male	female	male	female
Larissa	108	557	1322	57	44	97	46	44	29
Magnesia	106	398	1260	57	48	69	50	19	23
Trikala	100	381	730	51	29	72	30	14	8
Karditsa	56	300	571	42	14	54	16	18	3
TOTAL	370	1.636 29,6%	3.883 70,4%	207 60,6%	135 39,5%	292 67,3%	142 32,7%	95 60,1%	63 39,9%

Table 4: Primary Special Education Schools

Regional Unity	Nr of School Units	Employees		Principals		Assistant Principals	
		male	female	male	female	male	female
Larissa	4	19	63	3		1	
Magnesia	7	15	90	1	6		
Trikala	2	7	20		2		
Karditsa	1	3	17		1		
TOTAL	14	44 18,8%	190 81,2%	4 30,8%	9 69,2%	1 100%	

In primary schools, there is a complete under-representation of women in positions of responsibility, covering only 39.5% of positions of responsibility and only 3.48% of all working women. For men, the exact opposite result is seen, while they cover 29.6% of the workforce, they cover 60.6% of the positions of directors and a similar percentage, 30.1 in the deputy managers.

Impressive are the corresponding results in relation to the desire for a professional development, according to the ratified final ranking tables of candidate Directors / directors of the Primary Education Directorates of Larissa (Ratification tables of Larissa, 2017), Magnesia (Ratification tables of Magnesia,

2017) Trikala (Ratification tables of Trikala, 2017) and Karditsa (Ratification tables of Karditsa, 2017). The male candidates for director are 292, nearly twice as many as the women who are 142, while numerically they constitute one third of the total workforce. At the same time, however, it should be noted that out of a total of 142 women candidates, 135 were selected, a percentage of 94.4%, while the corresponding percentage of the 207 selected principals in relation to their 292 candidacies is reduced to 70, 9%.

In primary schools of special education, the opposite disproportion is observed in relation to general education. Employees fill only 30.8% of managerial positions, although they make up only 18.8% of the workforce. Women again make up 69.2% of the managerial positions and 100% of the assistant principals, but cover 81.2% of the total human resources.

1.2. Secondary Education

Table 5: General Education High Schools (up to 9th grade)

Regional Unity	Nr of School Units	Employees		Principals		Assistant Principals	
		male	female	male	female	male	female
Larissa	43	408	845	24	18	23	22
Magnesia	36	317	685	20	16	9	23
Trikala	21	193	383	14	7	10	9
Karditsa	19	128	264	17	2	6	8
TOTAL	119	1.046	2.177	75	43	48	62
		32,5%	67,5%	63,6%	36,4%	43,6%	56,4%

In high schools, while working women account for 67.5% of the total human resources, they cover only 36.4% of managerial positions. Conversely, we could say that it is the percentages of male teachers with 32.5% coverage in human resources but 63.6% coverage in management positions. The situation with the positions of women assistant principals is interesting, where the participation of men decreases to 43.6% and the participation of women increases to 56.4%.

Table 6: General (GE.L.) and Vocational High Schools (EPAL) of General Education (10th to 12th grade)

Regional Unity	Nr of School Units	Employees		Principals		Assistant Principals	
		male	female	male	female	male	female
Larissa	39	428	607	28	11	25	13
Magnesia	32	336	506	24	8	17	15
Trikala	19	234	297	12	7	10	6
Karditsa	16	142	203	13	3	8	4
TOTAL	106	1.140	1.613	77	29	60	38
		41,4%	58,6%	72,6%	27,4%	61,2%	38,8%

In the GE.L. and EPAL High Schools, while the number of working women is slightly higher than men, their representation in managerial positions is rather disappointing with a percentage of 27.4%, while increased but not corresponding to the overall percentage 58.6% of human resources are represented in 38.8% of the positions of assistant principals.

Table 7: School Laboratory Centers (SEC) (10th to 12th grade)

Regional Unity	Nr of School Units	Employees		Principals		Assistant Principals	
		male	female	male	female	male	female
Larissa	4	86	52	3	1	1	
Magnesia	3	79	73	3		2	
Trikala	1	7	8	1		1	
Karditsa	1	15	12	1			
TOTAL	9	187	145	8	1	4	0
		56,3%	43,7%	88,9%	11,1%	100%	0%

If we look at the SEC in detail, we will confirm another stereotype in relation to the technical specialties required in this type of school units. It is the only case of training at the levels under consideration, where male teachers prevail both in the total number of employees with a percentage of 56.3% which reaches 88.9% in the filling of managerial positions, in which, finally out of a total of 145 employees will we find only one woman and no assistant principal.

Table 8: Unified Vocational Special Education High Schools (ENEGYL) and Vocational Special Education and Training Laboratories

Regional Unity	Nr of School Units	Employees		Principals		Assistant Principals	
		male	female	male	female	male	female
Larissa	3	15	62	1	2		3
Magnesia	3	21	96	1	2		4
Trikala	2	14	42	1	1	1	1
Karditsa	2	15	43	1	1	2	
TOTAL	10	65	177	4	6	3	8
		26,9%	73,1%	40%	60%	27,3%	72,7%

In special education high schools (up to 12th grade), however, the percentages of female representation increase almost in proportion to the percentage of employees. Thus, they make up 73.1% of the human resources and respectively 60% of the managerial positions and 72.7% of the assistant principals.

Table 9: Principals of Secondary School Units of General Education (High schools, GEL, EPAL and SEK)

Regional Unity	Nr of School Units	Employees		Principals		Assistant Principals	
		male	female	male	female	male	female
Larissa	86	922	1504	155	55	55	30
Magnesia	71	732	1264	69	40	47	24
Trikala	41	434	688	59	20	27	14
Karditsa	36	285	479	47	14	31	5
TOTAL	234	2.373	3.935	330	129	160	73
		37,6%	62,4%	71,9%	28,1%	68,7%	31,3%

Its general picture is also interesting in secondary education. Thus, according to the ratified final ranking tables of candidate directors and directors of the relevant Directorates of Secondary Education of Larissa (Ratification tables of Larisa, 2017), Magnesia (Ratification Tables of Magnesia, 2017), Trikala (Ratification Tables of Trikala, 2017) and Karditsa (Ratification Tables of Trikala, 2017) out of the 459 total candidacies, 330 are men with a percentage of 71.9% and only 129 are women with a percentage of only 28.1%. During the selection, the 73 directors cover 31.3% of the total candidacies while the 160 men cover 68.7%. Of course, the proportion of candidates in relation to the total number of employees by gender is negatively impressive as the 330 male candidates out of a total of 2,373 employees represent a percentage of 13.9% and the corresponding of the 129 female candidates in the total number of 3,935 female employees is a percentage of 3.28%. However, the ratio of the 73 selected directors in terms of their 129 candidacies is 56.6% while of the 160 directors it is a little lower than the 330 candidates with a percentage of 48.5%.

2. Administrative Services of Primary and Secondary Education

2.1. Overall Picture

Table 10: The Administrative Services of Education

Carrier	Employees		General Directors		Heads of Department	
	male	female	male	female	male	female
Regional Directorate of Primary and Secondary Education of Thessaly	12	18	2		2	2

Directorate of Secondary Education Trikala	10	20	1		3	2
Directorate of Secondary Education Karditsa	14	23	1		2	3
Educational and Counseling Center (KESY) Larisa	6	32		1		
Educational and Counseling Center (KESY) Magnesia	4	19		1		
Educational and Counseling Center (KESY) Trikala	3	14	1			
Educational and Counseling Center (KESY) Karditsa	2	15		1		
TOTAL	148	281	9	5	22	21
	34,5%	65,5%	64,3%	35,7%	51,2%	48,8%

The administrative services of education of the region of Thessaly include all the bodies that are distinguished in table 10. The overall picture is proportional to the picture of the school units, while the female sex prevails overwhelmingly with 65.5% in the coverage of jobs, in the positions this percentage decreases depending on the severity of the position. Below is the specialization of table 10.

2.2. Specialized Picture

Table 11: The General Directors of Education

Education Directorate	Candidates		Selected	
	male	female	male	female
Directorate of Primary Education of Larissa	96	47		1
Directorate of Primary Education of Magnesia	68	44	1	
Directorate of Primary Education of Trikala	71	21	1	
Directorate of Primary Education of Karditsa	54	16	1	
TOTAL	289	128		
	69,3%	30,7%		
Directorate of Secondary Education Larisa	115	55		1
Directorate of Secondary Education Magnesia	70	39	1	
Directorate of Secondary Education Trikala	59	20		1
Directorate of Secondary Education Karditsa	47	14	1	
TOTAL	291	128	5	3
	69,5%	30,5%	62,5%	37,5%

Similarly, during the staffing of senior management positions (the temporary General Directors of Education), there are, according to the respective placement decision (Appointment of the Directors, 2020), only 3 women and 5 men out of a total of 8 positions with a percentage of participation in all positions of responsibility 37.5% for women and 2.5% for men, for the Region of Thessaly.

Table 12: Heads of Educational and Counseling Center (KESY)

Employees		Candidates		Selected	
A	Γ	A	Γ	A	Γ
15	80	3	9	1	3
15,8%	84,2%	25%	75%	25%	75%

Of interest in Table 13 is the absolute match of the percentages of gender representation both in the candidacies and in the elections for positions of superiors (Final Evaluation Lists KESY, 2018; Appointment of Heads of KESY, 2018). The percentage of male representation in the total number of employees of KESY is quite low, as it is a diagnostic body of special education.

Table 13: Educational Project Coordinators

Education Directorate	Candidates		Selected	
	A	Γ	A	Γ
Primary Education	15 48,4%	24 77,4%	8 57,1%	6 42,9%
Secondary Education	24 54,5%	20 45,5%	11 68,8%	5 31,2%
Special Education	1 33,3%	2 66,7%	1 100%	0 0%
TOTAL	50 52%	46 48%	20 64,5%	11 35,5%

The details of the educational project coordinators are of the same interest, as these are positions of special prestige where a lot of qualifications are required. While the 46 women candidates are marginally less than their 50 male colleagues, in the coverage of the respective 31 positions they are under-represented with a percentage of 35.5% which translates into a total of 11 coordinators (Ratification Lists of Coordinators, 2018; Appointment of Coordinators, 2018)

Especially in Primary education, although women constitute 77.45% of the candidates, when they are selected (where in the field of kindergarten we have only women candidates and selected) they are under-represented with this percentage decreasing to 42.9%. The corresponding representation of men increases to 57.1% compared to 48.4% of the applications of the sector.

In secondary education, although the difference between the 20 women and the 24 male candidates does not exceed 9 percentage points in the selection, this difference increases in favor of the 11 men who hold 68.8% of the seats. It is clearly observed here that while the candidacies are almost equal, the respective positions of responsibility are not proportionally equal, but increase by almost 2/3 for men and decrease to almost 1/3 for women. In the special education, finally, one male candidate prevails over the two female co-candidates.

Table 14: Heads of Departments of Administrative Services

Administrative Service	Candidates		Heads of Department	
	A	Γ	A	Γ
Regional Directorate of Primary and Secondary Education of Thessaly	12	18	2	2
Regional Center for Educational Planning of Thessaly	20	11	1	
Directorate of Primary Education of Larissa	16	25	1	4
Directorate of Primary Education of Magnesia	10	13	3	1
Directorate of Primary Education of Trikala	11	14	5	
Directorate of Primary Education of Karditsa	6	10	4	
Directorate of Secondary Education Larisa	20	46	1	4
Directorate of Secondary Education Magnesia	14	21		5
Directorate of Secondary Education Trikala	10	20	3	2
Directorate of Secondary Education Karditsa	14	23	2	3
TOTAL	133 39,8%	201 60,2%	22 51,2%	21 48,8%

Finally, referring to the data of the heads of all administrative services of the region of Thessaly, we see that even in the lowest hierarchical positions of the heads of the departments the percentage of female representation amounts to only 48.8% in relation to the male heads which cover 51.2% of the positions, when the 133 male employees constitute 39.8% while the 201 female employees 60.2% of the total human resources.

3. CONCLUSIONS

3.1. Recording Conclusions

Taking into account the numbers it is clear that while in the educational profession of primary and secondary education as well as in the respective administrative positions in Thessaly the female human resources are numerically overwhelming, the percentages of women in positions of responsibility, either in higher or lower, are rather discouraging.

The profession of teacher is represented in a high percentage in the levels of primary and secondary education by women as it can be considered as the continuation of child care and upbringing of children, which in turn has been associated mainly with women as mothers. (Athanasoula-Reppa, 2002: 2) At the same time it presents facilities in family life for women, due to the schedule.

A shocking exception is the branch of kindergarten teachers, which composes a typical example of "horizontal professional segregation" (Papagiannopoulou, 2013) where in this profession are concentrated exclusively women. The large proportion of women in this profession again determines the prestige and prestige that it reflects for women, but it degrades it stereotypically in the eyes of men and is not equally important and charming for them (Kantrantzi & Anthopoulos, 2006). However, this degradation of occupations that are considered "feminine" in the eyes of men is a consequence of the indirect discrimination of employees based on gender. (Stamati & Syriopoulos, 2011). At the same time, "this horizontal professional division" in the specific profession and with a relevant legislative provision of the Ministry of Education deprives women of the possibility of promotion to senior administrative positions, such as Principals and limits it to the lower positions of Headmasters (Drouga, 2019: 31). The special education in Thessaly, both in the school units and in the diagnostic bodies, is also female, with the exception of the top which is the Coordinator.

In the teaching sector, it has been concluded that the under-representation of women in managerial positions has two aspects. The first, is directly related to the number of women claiming professional advancement in education which is small while that of men extremely large. The second, concerns the selection of almost all women candidates, demonstrating the readiness (on an objective and subjective level) of women candidates when they decide to claim a position of responsibility.

In secondary education, although the percentages of working women are very high, their representation in positions of responsibility is inversely proportional to the corresponding percentages of men, with the same not showing a particular will for professional advancement. At the same time, the numerical superiority decreases, the desire for professional development and the coverage of positions of responsibility depending on the type of school, starting from the High Schools (up to the 9th grade), continuing with the GEL - EPAL and ending in the SEK with the lowest percentages.

In the administrative services of education of the region of Thessaly the same phenomenon is observed, the higher the position of responsibility, the more attractive for men and invincible for women candidates. Especially in filling the positions of responsibility, the percentages of women increase in the lower positions of the heads of departments and gradually decrease in the higher hierarchical positions of Directors / Coordinators of Education and Coordinators, with the exception of KESY as a body of special education.

The fact that women do not seek to claim positions does not mean that they are not interested and in no case can be interpreted as "... since women themselves do not want..." (Kantrantzi & Anthopoulos, 2006), but that they are significantly limited by others inhibitory agents (Drouga, S., 2019: 27). We will prefer a simple separation of external and internal factors (Daraki, 2007: 40) rather than personal-psychological, institutional-organizational-functional and socio-political-cultural (Athanasoula-Reppa, A., 2002).

3.2. External factors of under-representation

The institutional barriers that functioned in our country were particularly inhibiting, both during the professional course and during the development of a female teacher. Indicatively, the percentages of working women in education in Greece were reduced (eg 45% - 1960, 47.3% - 1970, 47.8% -1980, 48% -

1985 and 51% -1989-90), due to state intervention which set higher rates of admission of men to pedagogical academies than women. Similarly, the number of working female teachers was limited compared to men. Respectively, only in 1992 were men allowed to enter kindergarten and home economics schools. The gradual increase of the percentage of working women in the education sector and its substantial prevalence, stereotypically female, can be an important element in enhancing women's professional prestige through legislation (Kantrantzi & Anthopoulos, 2006).

As it can be seen from the invitations and the relevant laws of the Ministry of Education for the choices of its executives and having in mind the institutional barriers created by the non-scoring of parental leave for example, by definition the female sex is distinguished due to motherhood and scores fewer points for the same length of service than a male teacher, and respectively are counted in the teaching time for school counselors and principals of other types of leave. This unacceptable provision imposed by a female Minister (Diamantopoulou) after strong reactions was withdrawn only in 2015. From the same invitations we conclude that unfortunately there is no stable system of selection of management in the Ministry of Education (Frosi, 2017), and this lack is a key factor that increases the possibilities of discrimination of employees due to gender (Stamati & Syriopoulos, 2011).

The subjective element of the interview also works to the detriment of the sexes, as the service, administrative, disciplinary boards were mostly composed of male members. Only in 2000 and by law, the quota of 1/3 prevails in terms of members, where it is essentially stipulated that in a five-member council, at least two members must be women and this quota in favor of women in 2019 rose to 40%. Of particular interest would be the imaginative scenario, what would happen if the quota for female participation in decision-making bodies "rose" to 50%? How many five-member councils would consist of 3 women? Nevertheless, the subjectivity of the interview remains, which determines the final choice, as it was conducted "as they see fit". Only with Law 3848/2010 (Government Gazzetta 71/A) is a case study bank established and a specific interview procedure that changes its dynamics. It is no coincidence, moreover, that all the final ranking tables presented here, emerged as a result of the interview process, as it counts in the overall scoring of the candidates.

Interference in the selection of education executives is strongly governmental and to the detriment of women who are not highly politicized and find it difficult to participate in relevant political or trade union mechanisms. It is also not a coincidence that every change of government is followed by a direct change of management, because the Greek Ministry of Education wants to control the critical positions of government policy in education (Markopoulos-Argyriou, 2014: 532-533) (Drouga, 2019: 30).

Actions to increase the qualifications of the positions of responsibility in the school units, such as the assimilation of the qualifications of the teachers from two years to four years of study, the scoring of 10 years of service in a teaching position, as well as the additional scoring of the additional qualifications (OECD, 2020), worked in burden of the working woman, who wants but due to family obligations cannot meet. Extremely demanding, in terms of objective criteria and qualifications, are the corresponding invitations for the administrative staff of the Greek Ministry of Education.

However, the unequal distribution of roles in Greek society and the family hinders the further development of women. The second university degree, postgraduate degrees, postgraduate education is an elusive dream for women. (Kantrantzi & Anthopoulos, 2006: 15-16) (Markopoulos & Argyriou, 2014: 532) At the same time, the institution of distant education, which could meet the requirements of a working mother, cannot be characterized as highly developed or economical, with resulting in many women practically wishing they could not follow him.

The phenomenon of the glass ceiling roof (Drouga, 2019: 31), the invisible barriers (Papagiannopoulou, 2013: 29) and the so-called labor labyrinth (Schiess M., 2008), which result in the failure to fully utilize women in a workplace which translates into financial and not just costs, lead women to indignation as, although they possess the formal qualifications, it turns out that they have limited opportunities in professional development and face obstacles that their male colleagues do not face.

3.3. Internal factors of under-representation

The phenomenon of under-representation of women in positions of responsibility is a phenomenon result and consequence of economic and social structures and relations that translates into the capitalist way of economic organization and the patriarchal structure of Western society (Daraki, 2007: 39). This pyramidal structured system does not provide incentives (Boeing, 2008: 216) for the development of working women who consider administrative requirements excessive (Markopoulos & Argyriou, 2014: 532).

Women feel that professional development and family life do not go hand in hand, in particular the professional responsibilities that take time, cause tension and determine their behavior, are acting as a deterrent to claim a managerial role, as they feel exhausted and can not to cope or even enjoy their family life. (Niota M., 2018: 815-816) Many times it forces them to stop their professional development and not the men who do not seem to be affected by the dilemma "career or family" (Kantartzi 2003).

Women feel that they should adopt "male attitudes" in the administration (Athanasoula-Reppa, 2002) equally stereotypical towards women (Beelmann & Kai, 2009) and that they will end up as victims of bureaucracy and not school leaders (Markopoulos-Argyriou, 2014: 542). At the same time, they are called upon to confront their sexist categorization as either a low-ranking worker (including the female housewife!) or an over-educated "A 'female" (Sadigh, 2008). Even the post-feminist conception of the working woman is an internal barrier as the work practice demonstrates the myth of labor emancipation (Folini, 2007). Finally, they are confronted with stereotypical views that want women mothers in senior management positions to be less focused and limited to roles such as mother, caretaker, docile pet and blacksmith (Kougia, 2020: 31-32).

Since the social rules are shaped by men, they are subconsciously adopted by women and are an experience (Markopoulos-Argyriou, 2014: 542) with the result that occupying high positions and seeking higher incomes are not dominant goals even for women with high educational qualifications. Career is something that concerns the man. Thus, women are concentrated not only in specific "female" professions but also in the lower ranks of the labor hierarchy (Kantartzi, 2003: 104). The stereotypical and biased treatment of the working woman when claiming leadership jobs (Giannarou L., 2020) (Beelmann & Kai, 2009) is an additional internal barrier. Unlike their male colleagues, they prefer to teach rather than administer because they consider teaching and the socialization of students to be a career rather than a rise in the administrative hierarchy. (Markopoulos & Argyriou, 2014: 533).

INSTEAD OF AN EPILOGUE

Although the legal framework is now becoming an extremely powerful tool for promoting the gender equality, Greece seems to be in a transitional phase after the unprecedented and prolonged period of economic crisis and austerity which disproportionately affects women. The country has a unique opportunity to boost its economy if it prioritizes gender equality in its socio-economic recovery, suggests a group of independent UN women's rights experts who visited Athens in April from 1st until 12th of April 2019. The lack of available data and the ability to properly monitor the implementation of gender legislation at work are also an obstacle to progress in this direction (United Nations Report, 2019).

At the same time, the covert discrimination of women or their exclusion in the workplace goes beyond their social dimension and puts the democratic principles of the country (Athanasoula-Reppa, 2002).

Greece is finally moving towards achieving gender equality at a very slow pace compared to the EU average. According to the European Institute for Gender Equality (EIGE), it is at the bottom of the Gender Equality Index 2020. The complete marginalization of gender equality policy by proposing demographic and family policies as priorities of the current government policy points to a perception of women being restricted in the private sphere and to the role of motherhood, which runs counter to the demands of women from the last century. (To date and conflicts with the goal of gender equality: Network of Gender Equality Committees in Universities, 2019).

The understanding of the obstacles that stand in front of the professional development of gifted and very capable women in the administration of education and the corresponding will from the Greek Ministry of Education could lead to the development of strategies to eliminate the phenomenon of under-representation (Markopoulos-Argyriou, 2014: 534) stereotype "women teach and men lead". The under-representation of women in positions of responsibility should be an issue of immediate priority to ensure gender equality in the administration of education leading to the democratization of education and consequently of Greek society (Niota, 2018: 813).

Abstract: This report illustrates the application of stochastic modeling in banking marketing by using geometric Brownian motion to forecast expected bank sales over a period of time. It is known that credit institutions operate with foreign funds and it is of paramount importance how the bank invests and sells this resource. On the one hand, it meets the needs of its customers and offer them a variety of banking products and services, and on the other hand, it generates profit and maintains good liquidity and solvency. In this aspect, it is clear that marketers and managers in the bank must be able to forecast this important activity by reacting at any time to the changing macroeconomic environment. The importance of stochastic modeling of bank sales is especially necessary in times of crisis and pandemic, when both customers and banks are placed in a state of emergency and unpredictable situations.

Key words: bank marketing, stochastic modeling in banking, geometric Brownian motion, banking sales forecasting

1. INTRODUCTION

Bank managers and marketers use a variety of methods to forecast the expected level of future sales of a banking product or service.

Stochastic models currently provide the highest reliability and accuracy of forecasts and is therefore a preferred type of technology by researchers and professionals incl. in the banking sector. Prediction through a stochastic process means that random number simulations will be used in the modeling process. Stochastic models are mathematical algorithms to calculate the probability distribution of future expected values for a concrete process or occurrence. The calculation is based on simulating all possible changes for certain key parameters for the occurrence within a particular time interval.

In order to be able to forecast using stochastic methods, it is necessary for the bank to maintain a detailed database of historical data, from which particular parameters can be calculated. This database can be client list file, the Central Credit Register and the array in the information system of the bank. Based on numerous empirical observations, certain statistical tests determine which probability distribution best corresponds to the concrete data. The following presentation illustrates the application of stochastic modeling in banking marketing by using geometric Brownian motion to forecast expected bank sales over a period of time.

2. DATA AND METHODOLOGY

Numerous studies have shown that bank sales of certain package services follow an approximately stochastic process called "geometric Brownian motion" or "generalized Wiener process".

In addition to sales, simulation through geometric Brownian motion is used to forecast prices, exchange rates, interest rates and other occurrences which have only positive values.

Brownian motion is a term from physics and describes the random wandering of a particle, in an infinitely small time interval. From a statistical point of view, this is a randomly distributed process. The Brownian motion in its original form can take negative values and for this and other reasons, it cannot be used directly as a model for forecasting the price movement of financial instruments. Therefore, its mathematical modification is applied, namely the "geometric Brownian motion", which is expressed by the following formula:

$$\Delta S = S * (\mu * \Delta t + \varepsilon * \sigma * \sqrt{\Delta t})$$

where:

ΔS is the change in the value of sales for a certain period of time;

μ - the average arithmetic unit time;

σ - the standard deviation of the price of the financial asset;

Δt - time interval;

ε - the random variable.

The product $\mu * \Delta t$ is called drift, and $\varepsilon * \sigma * \sqrt{\Delta t}$ - simulated shock. In the simulation process, the input data is subjected to the combined effect of displacement and shock. The simulation model for calculating the expected value of sales for a given future period has the following form:

$$S_t = S_{t-1} + S_{t-1} * (\mu * \Delta t + \varepsilon * \sigma * \sqrt{\Delta t})$$

The application of geometric Brownian motion will be illustrated to forecast the expected value of bank sales for a 7-day period for a hypothetical bank.

For this purpose, it is first necessary to study the frequency distribution of sales. In most cases, daily sales often follow a normal distribution. This means that random variable values that have a normal distribution must be generated. It is most convenient to generate standardized random variables (with an arithmetic zero and standard deviation unit).

The model of the geometric Brownian motion will be programmed in Excel, and in its formula the inverse function for the probability density of the normal distribution will be built in place of it. As is known, the PDF function of the standardized normal distribution has the following form:

$$PDF(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}$$

From here the stochastic model of the geometric Brownian motion with normal distribution takes the following form:

$$S_t = S_{t-1} + S_{t-1} * \left(\mu * \Delta t + \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}} * \sigma * \sqrt{\Delta t} \right)$$

Where z represents a standardized variable calculated by the formula:

$$Z_i = \frac{X_i - \mu}{\sigma}$$

3. RESULTS

In our Excel modeling, instead of the formula for the standardized variable, we will use the built-in RAND function, which generates random numbers.

The daily sales of an anonymous bank operating on the Bulgarian market for a certain package product have the following parameters:

- final value of sales - BGN 7.342 million;
- planned annual return on sales -10.5%;

- standard deviation of daily data - 4.08%

Before being replaced in the model, the data must be converted on the same basis, for example annually.

The standard deviation is converted on an annual basis as follows:

$$\sigma_i = \sigma * \sqrt{D} = 4,08\% * \sqrt{250} = 64,51\%$$

The time interval in years is equal to: $1/250 = 0.0040$.

Tabla 1: Simulation of expected sales with geometric Brownian motion

Simulations	Day 1	Day 2	Day 3	Day 4	Day 5	Day 6	Day 7
1	7,342	7,471	7,896	7,665	7,515	7,876	7,747
2	7,342	7,238	7,433	7,955	7,896	7,741	7,409

4	7,342	7,286	7,132	7,485	7,166	7,106	6,897
5	7,342	7,248	6,654	6,269	6,056	5,954	6,343
6	7,342	7,414	7,251	6,995	7,107	7,105	7,672
7	7,342	7,529	6,972	7,061	7,326	7,288	6,749
8	7,342	7,506	7,385	7,440	7,799	7,660	7,761
9	7,342	7,218	7,721	7,549	7,418	7,936	7,776
10	7,342	6,823	7,036	7,207	7,101	6,682	6,800
11	7,342	7,122	6,923	6,798	6,618	5,892	5,744
12	7,342	7,150	7,330	6,711	6,299	6,637	6,392
13	7,342	7,749	7,929	8,202	8,197	7,944	8,493
14	7,342	7,537	7,240	7,426	7,756	7,856	7,312
15	7,342	7,279	7,155	6,846	6,606	6,371	6,261
16	7,342	7,965	8,022	8,505	8,616	8,420	8,405
17	7,342	7,299	7,237	7,234	6,810	6,706	7,089
18	7,342	7,513	7,577	7,273	7,179	6,891	6,548
19	7,342	7,423	7,161	7,480	7,083	7,179	6,859
20	7,342	7,378	7,066	6,930	6,798	7,424	7,324
21	7,342	7,397	7,275	7,239	7,269	6,950	6,829
22	7,342	7,210	6,730	6,782	6,910	6,904	7,135
23	7,342	7,293	7,198	6,612	6,506	6,305	5,995
24	7,342	7,117	7,383	7,694	7,475	7,503	7,272
25	7,342	7,836	7,895	7,909	8,274	8,061	7,750

In Excel, the model is programmed as follows:

$$=S_{t-1} + S_{t-1} * (\mu * \Delta t + \text{NORMSINV}(\text{RAND}()) * \sigma * \text{SQRT}(\Delta t))$$

This model calculates a minimum of 10,000 simulations to create a complete picture of the brobable distribution of sales. Table №30 presents the first 25 simulations of expected sales for the next seven days.

Table 2: Descriptive statistics of sales expected after 7 days

arithmetic mean	7,372571
standard error	0,02172
median	7,331776
standard deviation	0,726886
dispersion	0,528364
coefficient of excess	0,183336
asymmetry coefficient	0,273485
rank	4,721517
minimum value	5,284437
maximum value	10,00595
number of observations	10 000

Based on the calculated 10,000 simulations on the seventh day, the descriptive statistics in table №2 were calculated.

Chart №1 visualizes the scattering of bank sales simulations. The larger the standard deviation, the greater the scatter.

Graphic 1: Graphic picture of the simulations in sales through geometric Brownian motion for the next 7 days

It is important for bank managers and marketers to predict in what range sales are expected to fluctuate at a given probability. For this purpose, the standard error is first calculated as:

$$SE = \frac{\sigma}{\sqrt{n}} = \frac{0,7269}{\sqrt{10000}} = 0,00727$$

where:

SE is the standard error;

σ - standard deviation;

n - number of observations

The maximum error is then calculated at 95% probability. This is done by multiplying the standardized variable by the standard error:

$$\Delta_{\bar{x}} = Z \cdot SE_{\bar{x}} = 1,96 \cdot 0,00727 = 0,01425 \text{ млн. лв} , \text{ i.e. BGN } 14,250.$$

The lower limit of the confidence interval is defined as follows:

$$\bar{X} - \Delta_{\bar{X}} = \text{BGN } 7.372 \text{ million} - \text{BGN } 0.01425 \text{ million} = \text{BGN } 7.358 \text{ million}$$

And the upper limit of the confidence interval is defined as follows:

$$\bar{X} + \Delta_{\bar{X}} = \text{BGN } 7.372 \text{ million} + \text{BGN } 0.01425 \text{ million} = \text{BGN } 7.386 \text{ million.}$$

From here, the bank's marketing specialist can determine with a 95% probability that the expected value of sales will range between BGN 7.358 million and BGN 7.386 million.

Banking sales forecasting is one of the most important activities in the process of strategic marketing planning and in the decision-making process regarding the bank's product strategy. Underestimating or overestimating the expected sales growth always has serious consequences for the bank.

4. CONCLUSIONS

The conclusions that can be made on the basis of the developed example of the application of stochastic modeling in banking marketing by using geometric Brownian motion to forecast the expected bank sales for a certain period of time are the following:

Firstly, if the sales growth of a product line is underestimated, i.e., the market segment has expanded more than the bank predicted, it will not be able to meet consumer demand, i.e., customers will use the services of its competitors and it will reduce its market share.

Secondly, if the growth is overestimated and the forecasts are too optimistic, the credit institution will have a surplus of stocks, attracted funds, engaged specialists, unnecessary loans, etc., which will worsen the financial condition of the bank.

Which method to choose depends on the type of historical data, their frequency distribution, the forecast horizon, the required accuracy, etc.

Abstract: Short Food Supply Chains and local food systems have a great potential in boosting sales for local small-scale producers as well as contributing to the sustainability of agro-food systems. Consumers value local and traditional food products and are willing to pay more for the added value that locavores offer. In our pilot study, consumer motivational factors were examined with quantitative survey on a sample of young customers. The most outstanding consumer motivational factors as well as the differences between consumer groups with high and low perceived effectiveness in sustainable consumption were examined. The sustainable food consumption habits and willingness to pay more for food products that have additional values were also studied. The paper considers the significant differences between the segments with high and low perceived effectiveness of sustainable consumption.

Key Words: Consumer motivation, Locavore products, Hungary, Short Food Supply Chains, Willingness To Pay

1. INTRODUCTION

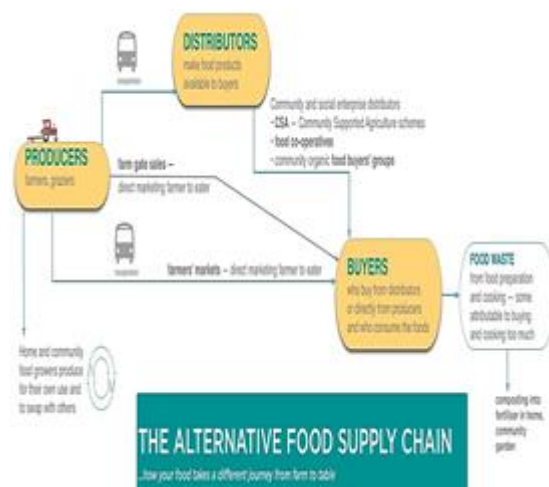

During a pandemic, the role of health and safety is growing in importance. A more sustainable lifestyle, including healthy eating, is becoming increasingly important for consumers. Short food supply chains (SFSCs) have recently been growing in popularity due to a new consumer trend on the European markets: there has been a growing demand for authentic, safe and healthy food and to buy locally produced food products, and consumer awareness of the origin of the product is increasing gradually (Dogi et al, 2014).

Consumers have become better informed, and they actively search for product information. Their decisions are influenced not only by the taste of the food products but also by the products' quality, nutritional value, and whether their preparation is time-efficient and healthful. Eating is not only functional any longer, but it is an integral part of our lifestyle, and it interacts with the daily activities and values of the consumer (Osztovcics et al., 2016). It is no coincidence that supporting the implementation of SFSCs and local food systems is a top priority for both the national government and for the European Union as well. But how does the young generation relate to local products?

2. LOCAL FOOD OR SUSTAINABLE FOOD?

Recent years have seen greater attention paid to re-localise food production and distribution in the agri-food sector. Re-localised production chains reduce the proximity between production and processing, furthermore, the local dimension and the regional provenance of the products are emphasised. Re-localisation can result in reduced proximity between the location of production and consumption as well.

Figure 1. A model of an alternative food system

Source: Pacifiedge, 2015

The different forms of SFSCs emerged in search for alternatives to conventional, long food chains partly due to a sense of dissatisfaction among consumers and producers. As opposed to conventional, mainstream food supply chains, short food supply chains allow for a stronger partnership between producers and consumers. SFSCs can strengthen the development of food networks, facilitate direct information exchange, create mutual trust, transparency, and traceability. The greatest benefits of SFSCs are fairer power relations of producers and their reduced economic vulnerability. Producers can become price setters rather than price takers, and they can apply more differentiated product marketing strategies with regards to packaging, the use of logos and brand names.

The word “short” indicates a reduced physical and social proximity and a minimised number of intermediaries. A short food supply chain is characterised by a limited number of economic operators and few (only one) intermediaries and their role is to promote a stronger link between the producer and the consumer. They are dedicated to enhancing local development and strengthening the social and geographical links between producers, processing companies and consumers.

The most typical forms are collective sales, specialist shops, shops owned by farmers or when farmers sell their products directly to public institutions or restaurants. A short food supply chain can become a form of direct selling when the consumer is in direct contact with the producer (Murdoch, 2000).

In the SFSCs, the most popular products are fresh seasonal fruits and vegetables, traditional, artisanal, processed food products. For consumers, SFSCs ensure that food contains reduced amounts of flavour enhancers and preservatives, they guarantee freshness and provide food with geographical indication of origin. Customers acknowledge the quality features of the products, the closer personal relationship and interactions with the producers. Developed mutual commitment and trust is a central component. The proper value of knowing the producer and the region where the food was produced is increasingly recognised.

Attention must be drawn to the difference between local food and sustainable food. Many people use these terms interchangeably, using local as a synonym for characteristics such as fresh, healthful, and produced in an environmentally and socially responsible manner. Technically “local” means that a food was produced in a defined place relatively close to where it is sold – the term doesn’t provide any indication of food qualities such as freshness, nutritional value, or production practices, and can’t be used as a reliable indicator of sustainability.

3. CONSUMER PURCHASING MOTIVATION TOWARDS BUYING LOCAL FOOD

European Union and the national government subsidies as well as consumer motivations towards buying local food as are emerging as market drivers for local products. Based on consumer trends in recent years, an increasing number of consumer trend groups have been identified. The local nature of products and consumer motivations to buy local products is gaining importance for young consumer segments especially in the case of food products.

3.1. Local food products and the LOHAS consumer

As discussed above, the concept of local food can be considered from two aspects:

- the role of uniqueness – the term “local” means that a food was produced or collected relatively close to where it’s sold. A local product is produced mostly by small producers, by using locally developed processes (recipes), or using local materials. The packaging material is often locally produced, and the products reflect the characteristics and cultural heritage of the region.
- the role of local production - the term “local” means that the food products were produced by local labour - within a radius of about 50 km – to meet the needs of the local population (the role of local production) (G. Fekete, 2012).

Local products typically include food and artisanal, handicraft products. Some of the additional characteristics that are often associated with the concept of local products are the following: they are usually made in smaller quantities, have a unique character that is typical of the region, represent a common local value and can be linked to a named area or settlement mainly through its historical heritage and tradition (Szente et al, 2014).

Today, research proves that consumers are increasingly committed to the environment, to social responsibility and responsible business. LOHAS (Lifestyle of Health and Sustainability) is a tool for understanding consumers’ behaviour and attitudes. LOHAS has five, clearly defined value categories that direct consumers’ behaviour: the individualistic values, authentic values, environmentally conscious values, ethical values, health-conscious values (Szakály, 2017).

In connection with these values, the preference for local products is growing in popularity. According to Impetus Research, LOHAS consumers represented 16% in 2020 in Hungary. These consumers consider authentic values to be more important than the buying experience, they pay attention to environmentally friendly nature of the purchased products, and the motivation to make the purchase is the value rather than the price of the product (Bacher, 2020). But to what extent are these values perceived among the younger generation?

3.2. Local food purchasing motivations of the young customers segments in Hungary

We have looked at the results of several surveys conducted in Hungary, and in this chapter, we summarise the main findings concerning the consumption of local food products: 95% of the 152 young people surveyed in Kaposvár have already heard of the concept of local food products, however, only 50% of the respondents are fully aware of the exact meaning of the term. Most young people have already bought a local product, and 15% of the respondents purchase local food products weekly or more often. Nearly 20% of the respondents have never bought local products. The majority of non-buyers are not interested at all, and 20% respectively say that such products are expensive or unnecessary, and 16.8% mentioned that they are more difficult to buy. In their opinion, the best place to purchase such products are supermarkets, local farmers’ markets, hypermarkets, stores selling local products, and finally the purchases directly from the producers (Sántosi– Böröndi-Fülöp, 2014).

In contrast, in Szente’s survey, more than 70% of the 1,000 respondents aged 18-75 consider it important, in part or in full, to be able to buy locally produced food in specialised stores (Szente, 2014). Based on the answers, the most important features of local products are as follows: such products are more natural and more nutritious, they are free of chemicals and preservatives, they are fresher since

they travel shorter distances, are more environmentally friendly, support local producers and local businesses. The emotional factors are the feeling of nostalgia for buying local products, remembering the good old times, entertainment, and the “feeling of guilt over neglecting buying local produce”. Besides, a survey conducted among young people in Kaposvár identified the main attitudes towards local products. Based on the mean of the 1-5 evaluation scale, the following order can be seen: 1. fresh; 2. evokes homemade flavors, traditional; 3. Safe and healthy; 4. consumer trust; 5. environmentally friendly (Sántosi– Böröndi-Fülöp, 2014).

The findings of Kovács et al. (2016) and Kovács (2020) are in line with the results of previous international research findings where better taste, higher quality and the environmental concerns as main motivational factors were identified (April-Lalonde et al. 2020).

According to Statista (2020), the main reasons for buying locally grown food are the following: 1. Local, small producers are supported; 2. They taste better; 3. They have better quality; 4. They have higher price-quality ratio (QPR); 5. They spend less time in transit, therefore more environmentally sustainable; 6. They are healthier; 7. You can discover food products that are not available in large retail shops; 8. They can take us back in time when food was mainly produced locally.

4. MOTIVATIONAL FACTORS AND THE PERCEIVED EFFECTIVENESS OF SUSTAINABLE FOOD CONSUMPTION AMONG YOUNG CONSUMERS IN HUNGARY

The aim of our study on the motivational forces and the perceived effectiveness of sustainable food consumption among young consumers in Hungary was to find answers to the following questions:

- What characteristics are considered most when buying food products?
- What are the most motivating factors when someone is buying locavore food products?
- Are young customers willing to pay more (WTP) for locavore food products?
- Is there a difference between the impact of the motivational forces and the perceived effectiveness of sustainable consumption among groups of consumers?

Our pilot primary research aimed to identify the most important motivational factors for consumers considering buying locally produced food. A quantitative survey that focused on the motivational factors and sustainable consumption choices was used for data collection. The survey was conducted in the form of an online questionnaire and CAPI interviews, over a period of two weeks in April 2021. The sampling method was a combination of quota and snowball sampling. After the data cleaning procedure, the answers of 432 respondents were analysed. All the respondents were between 18-39 years old and could make consumption-related decisions. The sample demographics were the following: most of the respondents were females (55%), and 45 per cent were males. 35 per cent of those filling in the questionnaire live in the capital city, 17 per cent in cities, 28 per cent in towns, and 20% in villages. The education level of the respondents was as follows: 9% were primary school pupil, 62% studied at secondary school, and 29% studied in higher education. With regards to the age group of the respondents: 63% of them were between the age of 18-24, 22% were 25-34 years old, and 15% are 35-39 years old. Data were recorded and analysed using Microsoft Excel and IBM SPSS Statistics 27. The main limitation of the study concerns the demographics of the respondents: we examined the age group of 18–39 exclusively. The other limitation is the non-representativeness of the sample due to the choice of the sampling method.

Three main groups of questions were examined in the questionnaire: first, the importance of the product attributes related to sustainable food purchasing; next, the purchasing motivation factors for locavore food products; and finally, consumers’ willingness to pay more for different product values, including local and hand-made food products.

The questionnaire included three main group of questions: the importance of the product attributes related to sustainable food purchasing, locavore food purchasing motivational factors, the willingness to pay more for different product values, including local and hand-made food products.

Among the different attributes considered, seasonal food was found to be the most important one (see Figure 3). 96% of the respondents reported that this was important in coming to a purchasing decision. The next group of characteristics included a reasonable price, nutritional values, and convenient purchasing conditions, factors which were rated as important by around 80% of respondents. Less important attributes are the attractive packaging (35%) and the locality of the products (45%). For the attributes related to the locality of the products, the ratios of neutral answers were significantly high. 38 per cent of the respondents consider the locality of the food products neutral, while the traditionality and locality of the products were important for 53% and neutral for 32% of the respondents.

Figure 3. The importance of the characteristics of food products, rate of TOP 2 scale values
 Source: own compilation

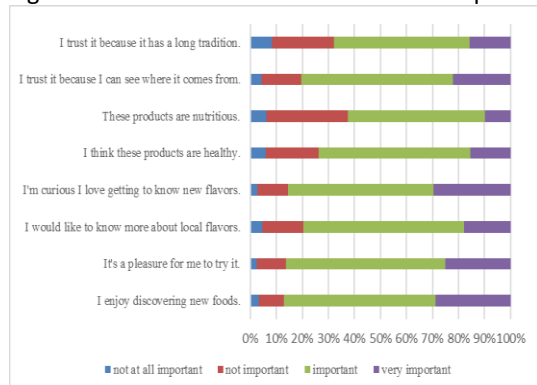

(Please rate the importance of the following items when you shop for food?)

5-point Likert scale 1=not at all important, 5=very important, Don't know

In the survey, the measurement scale had four motivation categories: hedonism, curiosity, nutritional value, traditional value. The answer frequencies of the hedonistic values are the most relevant motivation factors: "I enjoy that...." and "It is a pleasure for me to try....". The second most relevant motivation factor is curiosity (exploration): "I'm curious ..." and "I would like to know more". The least relevant factors are the nutritional value

and the traditional or local nature of the food products (see Figure 4.).

Figure 4. Motivation scale item answer frequencies

Source: own research, N=432

5-point Likert scale: Strongly Disagree 1, 2, 3, 4, Strongly Agree 5, Don't know

Regarding the willingness to pay more (WTP), the buyers are normally willing to pay a bit more for the products with the attributes shown in Figure 5. Young respondents are more willing to pay a higher premium price for food products that are artisanal, traditional, locally produced or animal welfare friendly.

Respondents are willing to pay the highest price for "artisanal", "traditional and local" products. In addition, young consumers are willing to pay a higher price for low-carb, low-sugar, low-fat food products. About 40% of the respondents are willing to pay 0-5% more for products having the attributes that we examined in this survey. About the same number of respondents would be willing to pay a 6-15% higher price for products that are traditional, local, organic, or low-carb, low-sugar or low-fat. Most of the respondents are willing to pay significantly (16%-25%) higher prices for artisanal products, but only a very few respondents would pay an even higher price.

Figure 5. Willingness to pay more for products with added values

Source: own research, N=432

Regarding the perceived effectiveness of sustainable consumption, 77.5% of the respondents try to do more to ensure sustainable consumption, whereas only 17% of them have no information, and 5.6% don't believe that something could be done. The segments with lower and higher perceived effectiveness of sustainable food consumption consider different motivational factors important. The most significant difference can be seen in the nutritional value factor and the health-related items (nutrition - Gamma 0.345, health - Gamma

0.278 significance 0.000).

For the other items, there is no significant difference: the members of both groups consider curiosity (discovery), hedonism and traditional values as equally important factors. However, those respondents who are willing to pay a significantly (over 25%) higher price would be much more likely to pay a high price for products that are organic, locally produced, traditional and animal welfare friendly.

SUMMARY

In recent years, as global food chains have expanded and became increasingly concentrated, there has been a growing demand for closer producer-consumer relations and the two ends of the food supply chain are re-connected by various types of short food supply chains (SFSCs). The immediate objective of the modern, innovative, and ethical forms of SFSCs is to promote locally produced food and artisanal products, to improve the visibility and recognition of local producers as well as to broaden the sales opportunities for high-quality products, which provides the opportunity for producers to sell and distribute within a maximum distance of about 40-50 km. There has been a growing demand for locally produced food and the customer attitudes are even more positive towards locavore food products.

Buying local food products can confer economic, social, cultural, and environmental benefits in the region and it contributes to maintaining the welfare and health status of the consumers due to the system's lower environmental impact.

Regarding the motivational factors, hedonism, and curiosity (discovery) are the most relevant motivational factors for young customers. Nutrition and tradition are less motivational, although all the factors had a positive motivational impact. Examining the willingness to pay more for handicraft, traditional local products, and animal welfare friendly products are found to be the most valued attributes.

Abstract: Corona virus 2019 disease known as ‘COVID-19’ has spread rapidly across the globe and has caused a major economic shock. This is not just a medical crisis, this is an economy crisis as well. Today’s companies are faced with overwhelming, competing challenges and uncharted paths as they continue to navigate the impact of the COVID-19 pandemic. Many companies are already taking “no regret” actions to appear from the pandemic stronger. These companies are facing the crisis through establishing variable cost structures, implementing agile operations and accelerating digital transformation. Companies must outmaneuver uncertainty by work correcting, again and again as circumstances change. This requires them to re-evaluate scenarios, to reassess assumptions, and strengthen their ability to sense and respond.

Macedonian companies are also affected by this pandemic. In order to research the impact of COVID in these companies, we conducted a survey of more than 100 companies in North Macedonia. The research has been conducted to assess the impact of COVID-19 on the work of this companies. The research aims to identify the constraints faced by companies in North Macedonia during the pandemic, the opportunities, the organizational performance of companies as well as their innovation. The results of this research indicate that the influence of this coronavirus is equally devastating in the country and in the companies. Also shows that COVID-19 and reactions to changes have a significant negative impact on companies. These ‘new normal’ changes negatively affected on employee's work, way of communication, and concentration on work significantly.

Keywords: Covid 19, company, performances, innovation, economy.

INTRODUCTION

The great uncertainty about the future is exacerbating the situation, many countries have closed their borders to foreign nationals, world trade is declining, and significant efforts have had to be made to avoid major delays in flows of goods.

Everything starts as a health crisis, far from our country, but COVID-19 led rapidly to a global economic crisis. The crisis has hit companies, although at different rates and to varying extents. Some sectors have suffered most because of the containment measures leading to lockdown and travel restrictions, namely restaurants, transport, tourism and educational institutions.

The COVID-19 pandemic, which has already infected almost 132,683,720 people in 192 countries, resulting in more than 2,879,979 deaths, has the potential to reach a large proportion of the global population. Some estimates suggest that 40-70 per cent of the world’s population could become infected.¹

Disruptions to production have now spread to supply chains across the world. Stock markets crashed, production stopped, oil prices dropped sharply, factories and shops began to close, and labour markets were disrupted.

The crisis already impacts not only demand (investment and consumption) but also supply (production of services and goods). All businesses, regardless of size, are facing serious challenges, but will be particularly difficult for Small and Medium Enterprises (SMEs) for sustaining their business operations.

¹ Figures for 07 April; Johns Hopkins University Center for Systems Science Engineering Dashboard, <https://gisanddata.maps.arcgis.com/apps/opsdashboard/index.html#/bda7594740fd40299423467b48e9ecf6>

In 2020 The COVID-19 pandemic and the resulting lockdown caused 114 million people to lose their jobs and a lot of companies to be closed.²

Following quarantine measures, border closures and travel bans, many workers cannot move to their places of work or carry out their job, which has negative effects on incomes, particularly for informal and casually employed workers. In many economies' consumers are unable or reluctant to purchase services and goods.

The pandemic is still raging as the world enters 2021, after an apparent mid-year lull in many countries, more infections and more deaths are being reported. Given the current environment of uncertainty and fear, companies are likely to delay investments, purchases of goods and the hiring of workers.

Economic measures of the Government to tackle the crisis by COVID-19

The Republic of North Macedonia has so far adopted six packages of measures to support the economy.

The last, sixth package of measures includes seven measures targeting the sectors most affected by the coronary crisis, worth 17.8 million euros, which will support 10,000 companies, which employ about 60,000 citizens. The government takes comprehensive measures every three to four months, in consultation with all stakeholders, as well as with international financial institutions, all in order to maintain the liquidity of companies and jobs for citizens.

It is extremely important to stimulate the liquidity of the economy. Hence the measures proposed by the Ministry of Finance are in that direction. One is Liquidity Support for companies that reinvested profits for 2020 by subsidizing interest rates on loans. The second measure is the Credit Line for financial support of business entities in the field of broadcasting radio and television programs in order to reduce the consequences of the coronavirus KOVID-19, through a special credit line in the amount of 61.5 million denars or 1 million euros with 0 % interest rate to be placed through the Development Bank. The past packages of measures have shown that they give results. The government stimulus contributed to double amortization of the economic decline last year, more precisely, according to the calculations of the Ministry of Finance, it is amortized by 4.2 percentage points, without the measures the decline would have reached 8.7%.

How does The Republic of North Macedonia deal with the pandemic in general?

After nearly a year of COVID 19 crisis in our country, the future is still uncertain. While the various vaccines give some reason for optimism, mutations in the virus and new information from the WHO (World Health Organization) about the likely persistence of the pandemic in 2021 are causes for concern. The last wave of COVID 19 hit much harder and the number of our citizens infected increased exponentially, putting enormous pressure on the health system to treat patients.

By the April 2021, the total number of diagnosed is 132.728 (6,7% of the total population) since the beginning of the epidemic, the number of cured patients is 111.765, the number of deaths is 4.073 and the number of active cases is 21.891.

The measures active as of November 2020 are the mandatory like wearing facemasks in indoor and outdoor public spaces, the restriction of public assembly of more than 4 people, restriction of the closing time of catering establishments, social distancing (2 meter) and hygiene measures remained the same.

RESEARCH METHODOLOGY

The main aim of the research is to find out what is the impact of Covid 19 on the companies in the Republic of North Macedonia in general. The main research problem starts with the constraints faced by companies during the pandemic, the opportunities if any, the organizational performance of companies

² <https://www.weforum.org/agenda/2021/02/covid-employment-global-job-loss/>

as well as their innovation. The research subject is focused on the question of interconnection between pandemic Covid 19 in the Republic of North Macedonia, and what the influence on the companies in our country.

Data were collected by means of a self-administered questionnaire, prepared in Google Docs. Questionnaire contained questions in closed ended format and a 5-point Likert scale. The questionnaire contained three sections with logically connected questions. The first section was designed to gather general information for the respondents, including the age, the gender, the work position of employees, and size and the proprietorship of the companies to which the respondents belonged. Also, respondents must answer did the pandemic has changed the way of the work in their companies, did they working from home (online), did they have some benefits and obstacles from online working and did their company apply the way of working from home after the end of the pandemic. The other two sections used questions for organizational performance and innovation in companies in terms of Covid 19. In order to complete the objectives of the study, the questionnaire was sent randomly to 400 respondents in the Republic of North Macedonia, and response was received from 107 respondents. The survey was conducted from November 1st to December 31st, 2020. Due to the scope of the research, in this paper, we will present only the first section of questionnaire. Most of the companies where respondents work according to the number of employees belong to the category of micro and large enterprises (Graph 2), most of them (48%) work only on domestic market (Graph 3) and most of the respondents (62%) are only employed in the companies (Graph 1).

Research results

As we mentioned in the previous section, in this paper are presented results only of the first part of the questionnaire that refers to the general information about the work of the Macedonian companies in pandemic. In order to get information from the employees of all levels at the companies, we sent the questionnaire to employees of different levels. Most of them are employees, but we have answers from the managers and owners also. The respondents are presented in the following Graph 1.

Graph 1: Position in the company of the person who answered the questionnaire

Source: author's own research

Next, the research was conduct in all companies taking into account the size of the companies, which is to be included companies of all sizes according to the general division of them. That can be seen in the graph 2.

Graph 2: Number of employees

Source: author's own research

Most of the companies included in the research are companies that market their product only in the domestic market (48%) but also there is a company that market their products and services on both domestic and foreign market, as well as companies that operates only on foreign market.

Graph 3: Market on which the company marketed its products

Source: author's own research

The most important question in the pandemic working is whether companies have changed their way of working. 92% of the respondents answered that they have some changes in the work in their companies. This is expected because the pandemic itself made changes in every aspect of the living, as well as in the companies work. The companies were forced to made changes and adjustments in the work according to the new conditions and protocols for work. From those 92% of the companies, 48% make changes but the changes were small and the others 44% made big changes. Usually, the changes are in the work of the administration staff that can work from home, with rotation of the employees or some combination. Also, the changes refer to the production and market of the products and services, communication with the clients, implementation of the protocols for work and etc.

Graph 4: Whether the pandemic has changed the way of the work in your company

Source: author's own research

Consequently, to the previous question and in this question 20% of the respondents answered that their company did not apply the work from home because of the specificity of the job that requires physical presence and 56% works from home but only some employees (Graph 5). Anyway, most of the companies (56%) applied the work from home method as some way to reduce the contacts between the employees and in this way to contribute to reducing the spread of the virus.

Graph 5: Does your company apply the way of working from home (online) because of the pandemic?

Source: author’s own research

The work from home as a new way for working showed that has some benefits, but and obstacles too. In order to identify the benefits of it we asked the respondents. From the results obtained by the research, we can see that, the benefits that company get from working at home is cost reduction (56.60%) and great staff flexibility (52.80%). That means that company can make extra profit. Also, some of the respondents said that the productivity of the employees is increased (13,20%). The other results are presented in the Graph 6.

Graph 6: What benefits did your company get from working from home?

Source: author’s own research

Except the benefits, the companies and its employees faced with a number of limitations due the pandemic. When it comes for work from home, most of the surveyed employees have lack of technical support for work from home (38,70%) that shows that our country was not prepared for this kind of work. Our companies do not have online work experience and most of them are manufactured companies how has not allowed online working. Also, the companies faced with barriers in communication with the employees and less control over the work of the employees. 28,30 % of the respondents said that this kind of work cannot be hold in the long run. The results are presented in the Graph 7.

Graph 7: What limitations did you have from working from home?

Source: author’s own research

According to the previous question where we can see that our companies are not prepared for this kind of work, 55% answered that would not apply the way of working from home after the end of the pandemic. 34 % answered that there are not sure if they will continue to apply the way of working from home after the end of the pandemic and 11% will continue to apply online working. These results are shown in the Graph 8.

Graph 8: Would your company apply the way of working from home after the end of the pandemic?

Source: author’s own research

Many firms expect a long recovery period, while some firms have adjusted to the new normal. Financial problem is at the highest levels for about 31.10% percent of companies, 28,3% has problem collection of receivables and 25.5% has problem with decrease in sales (Graph 9).

It is necessary the wage subsidy support because those that have been affected more severely expect a recovery on average of about 8 months for both sales and employment. Some companies do not expect ever to return to the pre-crisis levels. Expectations of companies in North Macedonia resemble the average for the EU member countries with respect to the length of the recovery period.

Graph 9: What challenges / problems does your company face during the pandemic?

Source: author's own research

CONCLUSION AND RECOMMENDATION

It is evident that the spread of the virus disrupting economic activity and have negatively impact on all businesses, especially in the developing countries. It affects all economies. The most obvious consequences include economic recession, a crisis of global governance and trade protectionism. The economic stress has started and will grow rapidly. It takes a while for the world economy to recover from the contraction.

The impact of COVID-19 was felt almost immediately in most industries and regions of the world. The Macedonian companies are facing with a lot of challenges caused of this pandemic. First, they have adopt the new ways for work in their companies, taking into consideration the new protocols and restrictions by the government. In the most of the business activities slow and some companies are seeing lower revenue resulting in less cash flow. Many of the companies in some sectors ware obligated to close their businesses in the time for the pandemic (for example restaurants for wedding are closed all the time, then restaurants, fitness clubs, sport clubs, kindergarten were closed in some period during the pandemic). This caused lot of the business to fire their employees or even to close their businesses. Despite the measures of the so called packages for support for the companies by the government, the businesses are still facing with a lot of problems in their work.

From the results we can conclude that most of the adjusted their work. Most of the employees started working from home. This change results with some problems and limitations, because most of the companies are not technical ready for this kind of work. After that, they said that in this way of work the control over the employees is reduced.

Further, the Macedonian companies faced with a lot of financial problems, decreasing of the sales and reducing the production. The consequences of the pandemic have very negative impact on the work of the most of the Macedonian companies. They will need time for recovery and a lot of additional support by the government.

Abstract: The key concept of the present paper is the inquiry into Strategic Planning in Higher Education in Greece and the reasons that made it necessary after the latest laws, as well as the needs of modernization that arose as a result of competitiveness in Higher Education. In this context, we first attempt to briefly explain and clarify the term 'Strategic Planning', and then its structural elements are analyzed, while extensive references are made to the stages of organization of Strategic Planning and the tools used by the institutions for its implementation.

Mainly researched and compared, the efforts to formulate the strategic architecture of a central Greek University (Aristotle University of Thessaloniki- AUTH) and a regional Greek University (University of Western Macedonia-UOWM) with different characteristics both at academic and administrative level, according to the goals they have set in each category of strategic action, with the aim of locating elements of Strategic Planning at Institution level.

After locating the above elements, an attempt is made to decode the success of the drafting of the strategic plans on the same model. One of our main research questions is whether University Institutions with different structural characteristics should and where should be differentiated in the drafting and recording of their goals.

Keywords: Strategic planning, higher education, national strategy, strategy at institutional level, strategic action, Greek Universities, academic strategy.

1. INTRODUCTION

The central theme of this paper is the strategic planning in higher education in Greece.

Strategic planning has widely defined as a process used by organizations to define strategy and directions for their future actions.

Nowadays European Universities have to operate in a highly competitive international and national environment. The demands of the knowledge society have posed significant challenges for modern Universities in various areas of their operation, in the administrative, academic, technological, research and financial sector, etc. (Stukalina, 2010).

Higher education is a key element of the European Strategy, which aspires to promote sustainability and inclusive economic growth. With its contribution and the possibility of influencing social and individual progress, it is logical that it is the main factor promoting innovation and research and "provides the highly skilled human capital that knowledge-based economies need to generate growth and prosperity" (COM 2013 499 final).

The needs that have arisen through the evolution of technology, the economic data of each country and consequently of the Universities themselves, the internationalization of education but also the strong competition, have led to the need for changes in the level of strategies applied in higher education. (Kazeroony, 2012).

The strong competition between the Universities in academic, research economics and student attraction level, is perhaps the principal reason for the need to change their development strategy and strategic architectural design.

Theories of strategic development, planning and management can be the basis on which Universities will try to develop their personalized strategy.

However, we should not forget that we are talking about modern and advanced forms of Universities, with multi-level activities, and a complexity that plays its role in how its strategic goals will define and served.

The specific organizational (Tavernier, 2005) and academic characteristics of each institution must consider.

This is where the research question arises, whether the strategic planning, development and architectural strategy of each University, should fully adapted to the general National Strategic Planning for Higher Education or should give by the competent authorities flexibility in creating their strategic map in Higher Education Institutions. Thus, they will shape it, considering mainly their special characteristics in parallel with the national strategy.

We will try to examine how the theoretical framework of strategic planning is applied in practice. Our aim is to show how the structural elements of strategic planning are implemented in the effort to formulate a national strategy, we could say which was not developed at a central level for all higher education, but practically the Universities after publication of Law 4610/2019 had to resort to changing their strategic architecture, in order to meet the challenges of the newly formed environment.

Today the country at the level of Higher Education has introduced the concept of competition between the Institutions, although we are talking only about public education. What arouses the research interest is that Universities with a completely different structure at all levels, but with common academic study programs, meet this challenge.

Accepting the fact that strategic planning works in response to the changes that have taken place in recent years in higher education in Greece, we will focus on the conceptual clarification of the term, and we will present those changes that made necessary the structural change of strategic plans of all Higher Education Institutions in the country.

In the present research we have focused on two universities which have completely different characteristics at the academic, administrative and human geographical level. We try to identify, compare and refer to the goals they have set for the future and the tools they have met the same requirement.

1.1 Strategic planning (strategy)

Rowley & Sherman (2001) defined strategic planning as a formal process designed to help an organization identify and maintain optimal alignment between important environmental elements.

Allison & Kaye (2005) defined strategic planning as a systematic process through which an organization agrees and creates a commitment between stakeholders and the priorities necessary for its mission.

In the above definitions, what we distinguish is the positioning of strategic planning as a tool of leadership, in order to determine the future necessary organizational changes depending on what the environment in which the organization develops requires, as well as what the groups of stakeholders demands. Key elements of strategic planning, which are the central pillar are the mission and the vision.

According to Bryson (2011) Strategic planning portrayed as a deliberate, disciplined effort to produce key decisions. The fundamental decisions and actions that shape and guide an organization are what it does and why it does it. He also records the importance of mission, vision and values during the process. The mission of an organization reflects its unique identity and serves as the foundation on which we can build a strategic planning initiative, (Immordino, Gigliotti, Ruben, and Sherrie Tromp, 2016)

The literature mentions several models whose application could lead to a successful strategic planning. Some of the key ones are shown in Table 1.

Table 1: Models for Strategy planning

Hunger and Wheelen (2010)	Allison and Kaye's (2005)	V. Evans (2013)
a. Environmental scanning	a. Get ready,	a. Strategy Statement
b. Strategy formulation	b. Articulate mission, vision, and values	b. Mission Vision Goals
c. Strategy implementation	c. Assess your situation	c. Analysis of external environment
d. Evaluation and control	d. Agree on priorities	d. Competency analysis
	e. Write the plan	e. Strategic Choices and proposed strategies
	f. Implement the plan	f. Resources
	g. Evaluate and monitor the plan	g. Basic Changes

A look at the above models and others that exist in literature shows that in order for a strategic plan to succeed, all that existed in the past as advantages must first reviewed, and control weaknesses, external threats and opportunities.

What is understand is that the models have a lot in common which mainly focuses on being able to understand what the mission of the organization is, what the internal and external influences are, as a strategic plan drawn up and what the organizational and developmental issues are resulting? On them will select the main strategic objectives, (Burkhart & Reuss, 1993; Pfeiffer et al., 1986; Roberts & Rowley, 2004).

1.2 Strategic planning in Higher Education

In recent decades there has been a change in the composition of Higher Education. A change associated with the rising cost of Higher Education, increased competition, public accountability, advances in technology, the development of distance education, massive open on-line courses (MOOCs), the demand for quality education, assessment but also student accessibility and satisfaction (Immordino, Gigliotti, Ruben, & Tromp, 2016).

In fact, the need for change in higher education in Greece was already visible from the mid-1970s, when rapid economic, demographic, technological and social developments, pushed non-profit organizations, including universities to adopt a strategic plan similar to that used in business (Goldman & Salem, 2015).

Other times the change is mandatory for the survival of the institution and other times it done voluntarily with the aim of improvement. In both cases, of course, the institution must be able to support this change, taking advantage of the medium and long-term opportunities, and adjust its policy appropriately to achieve the best possible results in the future.

But for an institution to support and implement change, it must have the right tools. An institution's strategic plan and action plan are some tools that can achieve change (Kohler, 2014).

We will refer to the concept of "plan". According to Kohler, "design" can be a holistic, abstract image of an object, such as a map or the design of a building, or a holistic, systematic projection of goals, purposes and processes. The second meaning of the term "plan" refers to the activities that must carry out in the present for a specific issue-problem, but looking to the future.

However, knowing that the project is an abstract concept, it should be note that within the foundation, the content of the project should not only be visible and clear, but should also gather the support of interested members of the foundation (Kohler, 2014). The involvement of stakeholders in the step-by-step process of strategic planning development on the one hand helps to achieve the desired result

strengthens through participation and collectivity the concept of “ownership” of strategic planning by the community.

But how does the concept of strategy relate to higher education institutions? We can use Clausewitz’s definition, proposed two centuries ago, to argue that strategy is the coordinated use of various activities, each of which is part of a holistic perspective designed to realize the foundation’s vision. Crisp (1991) defined strategic planning in higher education as the set of activities designed to determine the future direction of an institution and include specific steps that will lead in that direction (Goldman & Salem, 2015).

Based on all the above and considering the fact that strategic planning is a response to economic changes, government regulations, changes in student attraction, competition between institutions and international pressures, we understand that the planning and implementation process has a major role for a higher education institution (Goldman & Salem, 2015). According to Tromp and Ruben, strategic planning is a complex process for most organizations.

Tromp and Ruben (2010) argued that strategic planning has seven important stages. The first includes the mission, vision and values of the foundation that determine the reason for the existence of the organization, determine its future and highlight the principles and perspectives that will guide and influence the day-to-day work of the foundation and its organizational culture. The second stage focuses on identifying stakeholders and identifies their needs, expectations, and levels of satisfaction. In the third stage, reference to the external conditions according to which the social, economic, regulatory, technological and cultural environment considered and evaluated, including potential challenges. The fourth stage, clarified the objectives according to the institution’s goals. In the fifth stage, we define the strategic plans and action plans according to which there is a specific and detailed formulation of the ways and procedures that will follow for the realization of the plans. In the sixth stage, a statutory document draft that articulates the strategic plan and serves for the future direction of the organization. The seventh and final stage focuses on results and evaluation. It translates goals, strategies and action plans into obvious and effective measures that can be used in monitoring and evaluating design (Immordino, Gigliotti, Ruben, & Tromp, 2016).

We refer to the SMART approach of the strategic plan but also to the Key Performance Indicators (KPI). SMART analysis based on five specific characteristics of action plans and which are categorized based on the acronym SMART into specific goals, measurable goals, commonly accepted goals, (reasonable goals) and timelines (time-bound) goals (Kohler, 2014). Respectively, Key Performance Indicators are measurable goals that describe the process or results in relation to the goal and determine the time frame for achieving the goal (Goldman & Salem, 2015).

It is necessary to point out that in order for the strategic planning process to be successful, three urgent needs must emphasize. Directly related successful completion of strategic planning to leadership, communication, and evaluation.

Regarding leadership, it should note that defining leadership roles and responsibilities is essential to the effectiveness of a project. Regarding communication, without careful planning of communication, it is possible that organizational changes will not receive widespread support from the university community. For this reason, successful communication requires attention to each team that may be positively or negatively affected by the design process and the project objectives. Finally, in terms of evaluation, it is important to be there to monitor the progress of a project and evaluate its results. The evaluations made through the evaluation provide information for the development of new strategies and for the correctness and feasibility of the set goals. The above imperative needs to be considered during strategic planning, help to create a diverse leadership team consisting of members of the academic and administrative staff, students and other stakeholders, who will have deep organizational knowledge. In addition, a common sense of need for change develops, and it gained a historical continuity and consistency regarding the efforts made to change an organization and with the efforts that have made in the past and can influence current initiatives.

The design process is open to all so that those involved in it feel a commitment to it and the idea of ownership developed by all members of the institution involved in the process to avoid ignorance and

obstruction. Finally, thanks to the evaluation, the resources required for implementing the strategic planning are estimate (Shields, Scroby & Knight in Kohler, 2014).

2. MATERIAL AND METHODS

The reality in Greek higher education changed in 2019 after the publication of law 4610/19.” *Synergy of Universities and T.E.I, access to higher education, experimental schools, General State Archives and other provisions*”. After many decades, the two poles of technology education and university education came together .

The entire process characterized as a synergy between the institutions but these are multiple procedures that differ from case to case and no specific model followed for its completion. We can find the following cases:

- A. Technological institutes merge to form a University
- B. A small University absorbs a large Technological Institute. (Case of University of Western Macedonia).
- C. A Large University Institution in which no change has taken place (case of AUTh).
- D. Small universities are merging with larger ones.

This restructuring completely changed the map of Higher Education in the country.

In 2019, there were 19 university institutions and 13 technological educational institutions in total 32. After 2019, the country has 24 Higher University Institutions.

According to the explanatory memorandum of the competent Ministry of Education, the need for this kind of restructuring of higher education in the country arose because of the now changing numbers of the international environment, the speed of technological developments, the intense mobility of increased competition worldwide and the strengthening of higher education to play an important role in all of this.

Thus, it was necessary to overcome some basic pathogens of the past and to redefine its role in order to success the challenges posed to the economic and social development of the country. The solution of the total reorganization of Higher Education chose, with a view to the future and with a vision of the creation of new strong Institutions that will include with claims in the international academic map.

Universities were invited in a brief time to organize their architectural structure and to capture the strategic planning. The difficulties they had were mainly with the priorities and the unique characteristics of each institution.

The main source of our material was the website of the Ministry of Education and the website of the Greek Parliament. We will also draw material from the sites of the universities.

It should be noted that the speed of developments has led universities to make strategic plans without yet being ready to absorb the impact of change.

So what we are mainly looking at is how they moved in order to meet the obligation. And whether it will be necessary in a short time to redefine their designs using powerful and reliable tools.

2.1. The case of University of Western Macedonia

The University of Western Macedonia was founded in 2003 and until 2019 had 2 Schools and 6 departments in two cities of the Region of Western Macedonia. With Law 4610/2019 (Government Gazette 70/A/07.05.2019) the University of Western Macedonia merge with the Technological Institute of Western Macedonia, which consisted of 5 Schools and 11 Departments. Today, the University of Western Macedonia has 7 Schools and 22 Departments, in 5 cities of the Region of Western Macedonia.

Under these new circumstances of particular difficulty, the university must find the formula to combine unfamiliar elements from the former technological institute, must draw up the strategic plan for the coming years.

2.1.1. Vision and Mission

The vision of the University of Western Macedonia is its development into an important reference institution for Greek and European science and culture. Relying on excellence, its academic completeness and the knowledge produced in it, it envisions to gain a high position in the world ranking of university institutions and to become an institution of substantial support of economic, social and cultural creation at local and national level.

The mission of the University of Western Macedonia is the promotion and consolidation of knowledge and progress for the academic community and the society. The mission of UOWM refers to the following three thematics: a) Education - Research - Culture, b) Economy - Development c) Fair, responsible and d) open society.

2.1.2. Components and stakeholders

The stakeholders in the activity and development policy of the University are: a. Student community and graduates, b. Academic and Scientific Community c. Society and Institutions, d) The state and the Local Government. e) The world of business and the Economy. Strong and special is the desire to meet the expectations of the local community and the Greek state during the transition from the lignite to the post-lignite era of the Region of Western Macedonia. Also known as the transition process. University Institutions can play an important role in this effort, mainly through the triptych “education, research and innovation”. Especially in areas where the private sector is less developed, such as the region of Western Macedonia, the University can become a central pillar of development.

2.1.3. Swot Analysis

The position of the Foundation is certain to have changed significantly because of implementing Law 4610/2019, which does not allow comparison with previous evaluations. Also, the present analysis avoided using indexes of previous years of the University of Western Macedonia (ETHAAE (ADIP)) and comparing them with the average of Greek universities, as they refer to a previous situation, where the size of the Institution was about 1/3 of the current one. The estimates presented in the analysis are empirical estimates of informants (Deans, Heads of Departments and Directors) without quantitative weight.

Internal environment

Strengths

1. Medium-sized and flexible university Institution
2. Sufficient number of faculty members with satisfactory research work and international recognition, competitive compared to the work of other respective Institutions
3. Internal procedures in order to upgrade the quality of the educational-research project and the operation of the Foundation
4. Opportunities for collaborations with other Institutions and bodies of the country and abroad and participation in research networks and projects

Weaknesses

1. Geographical and institutional handicaps with implications for educational and research work
2. Internal organizational and administrative deficiencies and malfunctions

External environment

Opportunities

1. Ability to cultivate effective synergies with local institutions, local society and economy

2. Ability to find new financial resources and prospects for improving state funding.
3. Possibilities to increase the attractiveness of U.O.W.M. because of its geographical location and its policies

Threats

1. The macroeconomic environment and pursuit central policy pose, in many cases threats,
2. Competitive threats in the market of educational services

2.1.4 Strategic lines and Strategic targets

The strategic lines that define the future orientation of the U.O.W.M. There are three (3) and they refer to the competitiveness, the developmental character and the cultural mission of the Foundation. These strategic axes include ten (10) strategic objectives:

- 1st. Quality Assurance Policy of the Foundation
- 2nd Upgrading of the educational process
- 3rd Strengthening and promoting research
- 4th. Excellence - Functional support of the student community
- 5th Improving the attractiveness and internationalization of U.O.W.M.
- 6th. Search for resources, Improvement of services and infrastructure of U.O.W.M.
- 7th. Risk management
- 8th. Responding to the recommendations of previous evaluations
- 9th. Support of Western Macedonia in the post-lignite era-Interconnection of U.O.W.M. with the Economy.
- 10th. Supporting Culture & Networking with Society

The strategic objectives, which derive from the strategic lines, pursue through the development of functional quality objectives. These goals pursue through specific actions that are implemented in existing times.

An example of an action to record and achieve a goal is given. Strategic Objective 4, Line 1 (Competitive University), in order to understand the way of action.

QUALITY OBJECTIVE ACTIONS 4.1. (Promoting excellence in the educational process)

- 4.1.1 Institutionalization of student scholarships excellence at undergraduate and postgraduate level.
- 4.1.2 Offer incentives and opportunities to postgraduate students with excellent performance (2nd and 3rd cycle) for an academic career.
- 4.1.3 Centers of excellence and linking research with education.

QUALITY OBJECTIVE ACTIONS 4.2. (Organization and improvement of student care)

- 4.2.1 Improvement of student welfare infrastructure (housing and food) in all cities where the U.O.W.M. operates.
- 4.2.2 Improving the accessibility of the disabled in the structures of U.O.W.M. in all the cities that operate and care for their technical facility (elevators, reading systems, hearing).
- 4.2.3 Improving services that support students' leisure and living (sports facilities, entertainment and communication facilities, canteens).
- 4.2.4 Attendance by students of programs and services offered by municipalities (learning dances, cultural activities, etc.), in order to be integrated in the areas where they study.

4.2.5 Consultation with the local government and local bodies for the concession - utilization of buildings that will help in the student's improvement life, as well as for the improvement of the means of transport.

4.2.6 Benefits of basic student care for students of the 2nd and 3rd cycle of studies based on specific criteria and the financial possibilities of the Institution.

QUALITY OBJECTIVE ACTIONS 4.3. (Enhancing student employability)

4.3.1 Strengthening the institution of the internship of the students of U.O.W.M.

4.3.2 Part-time employment of undergraduate and postgraduate students in services and functions of U.O.W.M. (libraries, catering, farm, etc.), either through 2-hour or 4-hour employment, or through contractors who provide services to the Foundation (catering, canteens).

4.3.3 Sending every 15-day newsletter of the career and office with the labor market of U.O.W.M. to the alumni associations and active students of PDM, with part-time or full-time jobs in the State, the local authorities, and in companies of Western (mainly) Macedonia.

QUALITY OBJECTIVE ACTIONS 4.4. (Indications supportive applications for students)

4.4.1 Development of institutional support services for the students of U.O.W.M..

4.4.2 Support and enhance a culture of gender equality.

4.4.3 Staffing and improvement of the operation of first aid stations for the students of U.O.W.M. in all the cities where it operates.

4.4.4 Operation of counseling and psychological support services for the students of U.O.W.M.. in all the cities where it operates.

4.4.5 Providing incentives for the establishment of associations of all graduates of U.O.W.M.. and link to the Foundation's website.

QUALITY OBJECTIVE ACTIONS 4.5. (Promoting excellence in Art and Culture)

4.5.1 Awards and scholarships for excellence in Art and Culture, for undergraduate and postgraduate students who distinguish in their studies.

2.2. The case Of Aristotle University Of Thessaloniki

The vision of AUTH is AUTH to become an Excellent Public University with International Radiation

The mission of the Aristotle University of Thessaloniki, which will carry out with the goal of fulfilling the vision, is to offer the highest level of education, in an environmentally friendly and accessible university, to produce internationally recognized research and to contribute to its economic and social development country.

The AUTH strategy refers to 3 words "Excellent", "Public" and "International Radiation".

2.2.1 Strategic Architecture

The formation of the AUTH strategy follows an algorithm, the strategic architecture. Strategic architecture, the building of strategy, answers the basic question of where and how it will go where the organization wants to go in this case the AUTH.

In the strategic architecture of AUTH the vision "Excellent" and "International Radiation" measured and also set as goals: quantitative and temporal.

The questions that arise for AUTH the answer to which will determine the formulation of its strategy are:

What is the time horizon of the new strategy of AUTH?

Is the AUTH willing to commit to a long-term strategy that will be followed by the next rectorial authorities?

The benchmark for “Excellent” are the international rankings?

Is the target for “International Radiation” a percentage of foreign students and teachers?

2.2.2 Swot Analysis

Internal environment

Opportunities - Challenges

1. The networking of world society
2. The freedom of access through the internet throughout the corpus of scientifically coded knowledge (publications, patents, etc.) make knowledge a quasi-public good.
3. The world middle class is expected to reach 2 billion people by 2025.
4. The demand for university education.
5. The creation of the Single Higher Education Area
6. EU research support programs (Horizon)
7. The Erasmus Mundus programs,
8. EU support programs (eg Cohesion Fund, EIB) and other EU institutions can cover part of the declining public funding
9. The increasing demands of the private sector for new technology and innovation.
10. The position of the Aristotle University of Thessaloniki in Thessaloniki and in the wider region and the Balkans

Risks – Threats

1. The exponential speed of change
2. The global trend of declining government funding
3. Institutional and legislative framework
4. The decreasing funding.
5. The economic situation of the country that is not expected to improve in the next period.
6. The new landscape of higher education after the mergers

7. The increasing state intervention in the operation of the universities

External environment

Strengths

1. Large university with a wide range of scientific fields
2. The multiplicative capacity of the Aristotle University of Thessaloniki in terms of global knowledge
3. Interest groups (positive)
4. The high quality research potential
5. High level teachers
6. High quality students

7. Quality undergraduate and graduate programs
8. The location of the Campus in the city center
9. The complete network infrastructure and one of the most advanced digital services in the country
10. The wide range of services offered that support educational, cultural and social activity
11. Well-organized Research Committee
12. Continuous interaction with the city and society
13. The international network of inter-university collaborations.
14. Experienced and competent administrative staff

Weaknesses

1. Organizational culture.
2. The organizational model of AUTh
3. Interest groups (negative)
4. The slow pace of renewal of undergraduate programs
5. The “tired” building stock, which to a large extent has not been adequately maintained
6. The aesthetic reception of the campus
7. Lack of interdepartmental courses and programs
8. The reduction of human resource’s
9. Large ratio students to teachers

2.2.3 Strategic Plan

With the strategic development plan, the strategic vision is linked to strategic goals and defines specific, measurable and achievable results in the key areas. Thus, target values, indicators, deadlines set, in each sub-category of the educational, research and administrative activities of the Aristotle University of Thessaloniki, as well as in its extroversion and social response actions.

The main strategies and goals of AUTh are reflected:

1. Academic Development Strategy

- 1.1. Continuous modernization of the academic organization
- 1.2. Modernization of Undergraduate study programs
- 1.3. Competitiveness in Postgraduate programs
- 1.4. Lifelong learning programs
- 1.5. Quality and excellence in education

2. Research Strategy

- 2.1. Convergence of AUTh research to the respective leading Universities internationally
- 2.2. Increase research funding
- 2.3. Balanced support for all forms of research (basic / applied / humanities and social sciences)
- 2.4. Promoting quality and excellence

3. Organizational Development Strategy

- 3.1. Strategic management
- 3.2. Organizational and administrative modernization
- 3.3. Modern Human Resource Management
- 3.4. Improving daily operation

4. Strategy for Economic Development

- 4.1. Modernization of financial management
- 4.2. Optimizing the utilization of ELKE resources
- 4.3. Optimization of the utilization of the property of AUTH
- 4.4. Optimizing the utilization of bequest property
- 4.5. New sources of funding

5. Building and Spatial Infrastructure Strategy

- 5.1. Installation of all academic units in privately owned buildings
- 5.2. Utilization-modernization of building and technological infrastructures
- 5.3. Optimizing the use of educational infrastructure
- 5.4. Utilization of other infrastructures

6. Strategy for the Environment

- 6.1. Reduction of the environmental footprint of AUTH
- 6.2. Aesthetic and architectural upgrade of the campus

7. Internationalization Strategy

- 7.1. International dimension in education and research
- 7.2. Optimization of the participation of AUTH in international networks
- 7.3. Optimization of AUTH collaborations with foreign universities

8. Social Strategy

- 8.1. Promoting innovation and entrepreneurship
- 8.2. Dissemination of research results
- 8.3. Optimization of the participation of AUTH in networks of institutions
- 8.4. Opening of the campus in the city
- 8.5. Creating networks with the Greek community
- 8.6. Creating networks with graduates

9. Student Welfare Strategy

- 9.1. Development of a model for the management of students' housing needs
- 9.2. Optimization of services
- 9.3. Office for the Coordination and Development of Sports and Cultural Student Activities
- 9.4. Development and implementation of a model for the provision of health services to students and members of the AUTH community
- 9.5. Development and implementation of a service delivery model for the disabled

3. RESULTS AND DISCUSSION

From the above data we could say that both Universities, despite the basic differences in their characteristics, basically use the model Strategic Planning in Higher Education Framework of Tromp & Ruben, in terms of the mode of action and the Swot analysis on which based on their overall design, combining of course elements from other models. However, we should not ignore the fact that in Greece the strategy of HEIs based on the planning and suggestions of the Central Government. A feasible strategic planning should primarily be based on the concept of autonomy, so that universities can devise on their own the strategy that suits their particular character and mission. However, if modern legislation allows it, the first important concern of the institutions is to secure the funds, both public and private, required for their smooth and uninterrupted operation.

Therefore, it is logical and predictable that the attempt to compile strategic plans in the same way by two so different institutions will not have the same results for both. Of course, where they differ are the priorities they set.

The next step should be to introduce innovations using new technologies in order to improve the financial situation of universities and reduce their costs. After the funds secured, the spatial restructuring of the university infrastructure should proceed in order to reduce the multi-dispersion of financial resources, but also to create a modern, comfortable and functional environment that meets its expectations. teaching staff and student-researchers. and stakeholder groups, (Gianzina-Kassotaki Olga & Kassotakis Ioannis, 2013).

The goals set by both Universities are quantitative and qualitative. However, efforts to control the performance of these objectives do not appear to be structured on a specific method. Quantifying the result and how the objectives will be measured is what is required. Through the experience of the business sector, methods could be used that with specific modifications can be adapted to the needs of higher education.

But the success of the strategy does not depend only on the correct use of individual tools. The proper goal must be to create a functional connection between the tools. Strategic planning, implementation and control are best served if they allow the institution to reflect on its development and learn about the future (Sigrun Nickel, 2011).

In this direction Benchmarking is a very useful tool of private management that is increasingly used in the business world, achieving impressive results. An extremely interesting challenge is the implementation of Benchmarking in the public sector, following the stream of public management (Keehley et al, 2008). The practice of Benchmarking could be decisive for the increase of the efficiency and the modernization of the functions of the Universities in the development of their strategic plans. Techniques, methods and functions can be an example to be imitated for some appearances of the Public Universities. Costs that may have a deterrent effect on implementation at a University can be covered as an investment, to increase efficiency in the future.

Another suggestion is to apply the Balanced Scorecard method. The Balanced Scorecard is a widely used method to diagnose and improve on an organisation's performance. It is a management tool that translates an organisation's mission and strategy into a comprehensive set of performance measures that provide a framework for a strategic management and measurement system (Rompho, N.,2008). Robert S. Kaplan and David P. Norton introduced the concept of the balanced scorecard (BSC) (1992)

with four main conventional perspectives: 1) Financial Perspective–Are we meeting the expectations of our Shareholder? 2) Customer Perspective–Are we delighting (or at least satisfying) our customers? 3) Learning and Growth Perspective–Are we prepared for the future? 4) Internal Process Perspective–Are we doing the right things?

The BSC Balanced Scorecard in Universities can be a tool for coordinating the activities of the academic and non-academic departments of a university and the mechanisms of budgeting and target agreements (Küper, 2013). The aim of the concept is to overcome the shortcomings of traditional performance measuring systems, which rely only on financial outcomes (Pietrzak et al., 2015).

4. CONCLUSION

Recognizing that higher education is an area characterized by a range of objectives, a diversity of stakeholders and particular forms of governance, strategic planning could be defined as a “tool” to provide guidance on the future decisions that each higher education institution wishes to take in order to meet the demands of modern society.

In what has already mentioned, a comprehensive strategic planning must have at the core of its interest the vision, the mission and the values of the institution (or the program), as these define its reason for existence, but also its identity. Universities are facing an ever-changing environment, that of globalization, demographic change, the sweeping penetration of information technology and new technologies in teaching, but also economic austerity.

For this reason, it is now imperative for institutions to change their organizational structures, to develop a solid financial base, to gain efficient operational structures, to introduce innovative processes, to use new technologies as the key factor in facilitating the learning process, while attracting high level educational and research staff (Friga et al 2003). In this way, universities will increase their quality in teaching and research, while becoming competitive in the modern, globalized environment of higher education (Hawawini 2005; Veugelers and van der Ploeg 2008).

In recent years, higher education institutions have embarked on one form or another of strategic management. Too often the results are below expectations. Mainly because models are usually copied without being appropriate. More than business, strategic management of higher education should address the specific organizational characteristics of the sector. To see what is really important for strategic decision-making in universities, we need to start with benchmarking by looking at specific decision-making cases and setting achievable goals.

It is sure that the Greek Universities, especially those that faced a huge change in their physiognomy, will be called quickly to adapt the Strategic Plans. Their strategic plans are in constant consultation until their final form. The effort is continuous, and the field is of significant research interest for the future.

Which factors affect the attitude of consumers to use intelligent information systems to reduce the ecological footprint?

Markou I. Vasiliki¹

Serdaris Panagiotis²

¹PhD (c), Department of Management Science and Technology, University of Western Macedonia, Kozani, Greece, email: vasomarkou14@gmail.com

²Prof. Dr. Department of Management Science and Technology, University of Western Macedonia, Kozani, Greece, email: serpan54@gmail.com

Abstract: This study presents information on the determinants of consumers' attitudes towards the use of intelligent information systems resulting in a reduction of the ecological footprint, in order to motivate companies to adopt practices to increase their profits. The empirical analysis is based on the estimation of binary logistic regression models. Four subsets of independent variables were used in this empirical analysis, namely: (i) demographic factors, (ii) economic variables, (iii) payment mood, and (iv) variables related to environmental awareness and various incentives. Empirical results show that environmental knowledge, the intention to pay extra money and the reduction of vehicle use in order to reduce the ecological footprint are the statistically significant factors. In addition, the intention of the respondents to pay more for foods that use technologies to reduce ecological footprint, is gender, educational level, but even in this case is the knowledge of the environment. All these are tools for the management of a company to implement the information systems in order to reduce the ecological footprint as a whole but also to increase their consumers.

Keywords: consumer attitude, information systems, ecological footprint, information systems applications, intelligent information systems and consumer

1. INTRODUCTION

The continuous degradation of the natural environment, the reduction of natural resources and the general degradation of the quality of life of the individual comes, among other things, from the reckless use of energy and natural resources. Global environmental problems today have become enormous and CO₂ emissions are constantly increasing, and this has the effect of increasing the ecological footprint deficit in Greece (<http://data.footprintnetwork.org/>). Ecological footprint, means the area of productive land, drinking water and sea, which are needed to re-produce the natural resources consumed in the designated unit (man, city, country, etc.) and to carry out waste management produced, provided the technology. (Rees & Wackernagel, 1996) Also, there is a rapid development of technology and information systems and this may be a tool to help with the problem. According to (Laudon & Laudon, 2014) in 2012, in America, organizations spent over \$ 540 billion on shielding and upgrading Information Systems, which means that these technologies are widely used today. Therefore, the purpose of the study is to present what are the factors that influence the attitude of consumers towards the use of intelligent information systems resulting in a reduction of ecological footprint.

The goal of this research goal is to find the variables that determine consumer behavior to reduce its ecological footprint. First, a literature review was conducted for research on practical applications of information systems technologies, then a questionnaire was compiled and then the data were analyzed in order to draw conclusions. A very brief reference will then be made to the studies studied. In the past, studies have been done with various information systems techniques to reduce the ecological footprint. In 2009 Ilicet. all, (Ilic, Staake, & Fleisch, 2009) aimed to demonstrate how the use of information systems, specifically the use of sensors, can help control vulnerable products with the ultimate goal of reducing greenhouse gas emissions. They carried out an experiment in Switzerland, taking strawberries as vulnerable products, in order to prove the reduction of the carbon footprint in the retail supply chains. The research shows that the use of sensors can reduce gas emissions, reduce waste, but also provide better management during the transportation of products, and by extension the ecological footprint.

Also in the food sector, Singhet et al 2015, showed that the use of information systems, and in particular the use of the Cloud, can help reduce the ecological footprint. (Singh, Mishra, Ali, Shukla, &

Shank, 2015) According to research, beef has high emissions of greenhouse gases (slaughterhouse, processing, sale, supply chain) as well as methane and nitrous oxide gases. The researchers propose an integrated system using Cloud Computing (CCT) technology, where all those interested in the beef supply chain can measure and minimize carbon emissions at the end, with some additional output and use of infrastructure. In the field of transport through the use of GIS, can help educate and influence consumers to help reduce the ecological footprint of a city by addressing issues such as housing, urban planning and transport. Schatz, et al., 2013 showed that reducing the ecological footprint of a community can be achieved after considering this process as a long-term investment program, as well as the use of GIS can create sustainable communities. In addition, Andersen, et. all 2013, reported in their research that using GPS can reduce fuel consumption. Eco-guidance allows drivers to use the most environmentally friendly routes and is effective in reducing vehicle emissions.

Regarding consumer behavior, according to Gordon, et all, (2021), their research there are specific frameworks that shape consumer behavior to choose a product. Regarding the product itself, the characteristics that influence the choice are its brand and price, however, there are other factors related to its selection. One factor is product differentiation, information and learning history. Other factors are the elasticity of consumer demand, the core value of brands, as well as individual differences in consumer market patterns, as well as existing laws. (Gordon Foxall, 2021)

2. METHODOLOGICAL ISSUES AND DATA

The research provides some insights into the determinants that influence consumers' attitudes towards the use of information systems to reduce the ecological footprint, using a set of cross-sectional data from Greece. We carried out a survey of 100 consumers, from December 2019 to January 2020, using the random stratified sampling method. So in order to examine the attitude of consumers towards the use of information systems to reduce their ecological footprint, it should essentially be examined whether they are willing to pay or "suffer" more, motivated by environmental protection through the reduction of ecological footprint. Data analysis was performed through the econometric SPSS program. The questionnaire was divided into three parts. In the first part there were the demographics, in the second part there were questions about the knowledge they had about ecology, but also whether they were willing to either pay more money for products that use information systems, or to reduce vehicle use through various measures that could be implemented by the information systems and the third part was about energy saving issues.

3. RESULTS AND DISCUSSIONS

Empirical results are based on the estimation of the following expanded probit specification for a consumer's willingness to pay more money for food which using technologies reducing ecological footprint (i) and (ii) have positive attitude towards the use of technology in order to reduce the ecological footprint.

$$plhromi = b_1 + b_2Age + b_3gendre + b_4income + b_5trito + b_6positiv + b_7Gclima + b_8oikoapot + b_9simprog + u_i$$

$$positiv = b_1 + b_2Age + b_3gendre + b_4 income + b_5trito + b_6Gclima + b_7plhromi + b_8Redcarco0 + u_i$$

Where: plhromi is a dummy variable accounting for 1 the consumer is willing pay more money or foods that use ecological footprint reduction technologies and zero otherwise; Age is the respondent's age; Gender is a dummy variable accounting for 1 if the respondent is female and zero if male; Income is the respondent's monthly private income in Euro; trito is a dummy variable accounting for 1, if the respondent has completed higher education and zero otherwise; positive is a dummy variable accounting for 1 if the respondent has positive in the using of technology in order to reduce the ecological footprint and zero otherwise; Gclima is a dummy variable accounting for 1 if the respondent knows the term climate change and zero otherwise; oikoapot dummy variable accounting for 1 when the respondent knows the term ecological footprint and zero otherwise; simprog is a dummy variable accounting for 1, if the respondent would participate in environmental information programs and zero

otherwise; Redcarco0 is a dummy variable accounting for 1, if the respondent would limit the use of the vehicle in order to reduce emissions and zero otherwise; and u is an error term.

3.1 Descriptive Statistics

From the sample of 100 consumers in question, 48% were women and 52% were men. The mean age of the sample was 46 years with a maximum age of 83 and a minimum age of 18 years, 27% had completed higher education. The average net monthly individual income of the participants was € 607, with zero minimum income and a maximum of € 1400.

Some notable statistics were the following. Only 22% knew “what is the ecological footprint”, while 20% would pay more to buy fruit that uses technologies to reduce its ecological footprint and 27% would pay more to buy beef in the same category. All of this shows that consumers are still not well informed and there is a gap in the market. For transportation, 65% used a passenger car for their transportation. For the incentives to reduce the use of the car by the respondents, 51% would limit the use of a car in order to reduce emissions, 92%, would limit the use of a car if a tax was imposed, while only 40%, would limit the use of a car if there was a reduction in road taxes due to non-use of a car. Finally, only 36% would choose a longer route if you knew it would have fewer environmental impacts. That is, it shows that the imposition of an environmental tax is the strongest incentive at the moment. A possible explanation is that, consumers are not environmentally aware. Finally, when asked if they would be given the opportunity to participate in an environmental awareness program on the ecological footprint, only 43% answered in the affirmative.

3.2. Probit regression analysis

Several interesting results were obtained from the empirical estimation of Eq. Table 1 summarizes the empirical results of the logit equation’s estimated coefficients with respect to consumers willing pay more money or foods that use ecological footprint reduction technologies, and Table 2 summarizes the empirical results of the logit equation’s estimated coefficients with respect to consumers has positive in the using of technology in order to reduce the ecological footprint. Statistically non-significant variables were omitted from model I and the final results are presented in Model II.

Table 1: estimated coefficients with respect to consumers willing pay more money or foods that use ecological footprint reduction technologies

	Model I	Model II
Constant	1,241	1,797
age	0,125*	0,105
gender	-5,949*	-6,332**
trito	8,058***	7,979***
income	-0,371	
Gclima	7,613**	7,107**
goikoapot	7,061**	7,427**
positiv	-5,158**	-4,780**
simprog	2,598*	2,183*
-2 Loglikelihood	36,009	36,366
Cox&Snell R ²	0,554	0,552
Nagelkerke R ²	0,404	0,402

Note: ***, **, *, represent levels of significance at 1%, 5% and 10%, respectively

Table 2 estimated coefficients with respect to consumers has positive in the using of technology in order to reduce the ecological footprint

	Model I	Model II
Constant	22,912	1,156
age	0,093*	0,084**

gender	-2,664*	
income	-1,486*	-1,038*
trito	-20,232	
Gclima	6,228**	4,781**
plhromi2	2,011**	3,037*
Redcarco0	0,093	1,038**
-2 Loglikelihood	22,299	23,837
Cox&Snell R²	0,260	0,247
Nagelkerke R²	0,487	0,448

Note: *, **, *, represent levels of significance at 1%, 5% and 10%, respectively.**

As follows from Table 1, gender is a statistically significant factor and especially women's will pay more money. This result is in line with previous studies. Moreover, people who have high educational level are more likely to pay more money. This obviously has to do with access to information, as well as updating them. Also, this confirms that those respondents said they know what climate change was likely to spend more money and those who knew the term ecological footprint. Similarly, both variables are related to the knowledge of the respondents, as well as those who would participate in an environmental information program, were more likely to pay more money. The paradox is that those who say they have a positive attitude towards the use of technology in order to reduce the ecological footprint, are more likely to pay extra money. The results show that the fact of a positive attitude does not contribute, but stronger incentives must be given so that consumers can turn to alternatives.

Continuing on the second regression, the second model showed that as consumer's age, they are more likely to have a positive attitude towards the use of technology. This may be related to the previous regression, where it was found that as the age increases, the ecological footprint decreases. As with previous findings, those with knowledge of climate change were more likely to have a positive attitude. The importance of consumer knowledge about the ecological footprint has become apparent. Even people who would limit the use of their vehicle in order to reduce the ecological footprint were more likely to have a positive attitude. Opposite results were obtained with income, namely, as the income of the respondents increased they were less likely to have a positive attitude towards these technologies, however those who would pay more for eco-food were more likely to have a positive attitude towards the use of technology with to reduce the ecological footprint.

DISCUSSION AND CONCLUSIONS

This paper has focused on providing information on the factors that determine consumers' intention to use intelligent information systems technologies to reduce their environmental footprint so that businesses can adopt practices to increase profits. The study presents both practices that have been studied so that businesses can adopt so that they can reduce their footprint, as well as different consumer characteristics so that they can target specific promotional practices in order to attract them. In particular, empirical results, concerning the characteristics of consumers, suggest that, the factors that influence the intention of the respondents to pay more money for the purchase of food that uses technologies to reduce the ecological footprint are gender, educational level, but even in this case it is knowledge. It is therefore very important to stress that in order to reduce the ecological footprint; measures related to both informing and educating consumers on environmental awareness must be taken. The factors that influence the attitude of the respondents regarding the use of information systems technology in order to reduce the ecological footprint are age, income, environmental knowledge, intention and the reduction of vehicle use in order to reduce the ecological footprint. Therefore, as it turns out, it is very important to have targeted actions both for each age group separately and depending on the background of ecological consciousness of each individual. However, a point of consideration is centered on the fact that results are based on consumer intent. Thus, a limitation of this study is that the conclusions are based on consumer's stated preferences.

The Principle of Confidentiality In International Arbitration

Mirjana Ristovska¹

¹ Associate Professor, Faculty of Law, Univeristy “St. Kliment Ohridski” – Bitola,
mirjana.ristovska@uklo.edu.mk, <https://orcid.org/0000-0002-1766-1919>:

Abstract: The principle of confidentiality is diametrically opposed to the principle of publicity, as a generally accepted principle in court proceedings. Confidentiality in arbitration proceedings is practically stated as one of its most significant features and advantages over court proceedings.

The aim of this paper is to examine the principle of confidentiality in international commercial and international investment arbitration. In this context, the author will try to answer the following questions: What is meant by confidentiality in arbitration proceedings? Is there a fundamental difference between the confidentiality and the privacy of arbitration? What does confidentiality involve? What are the future trends of the principle of confidentiality in arbitration proceedings?

For the purposes of this paper, several methods will be applied: normative analysis method, comparison, analogy, and case law method.

Keywords: confidentiality, commercial arbitration, investment arbitration.

INTRODUCTION

Confidentiality is one of the basic advantages of arbitration proceedings and perhaps one of the main reasons why parties choose to arbitrate. Confidentiality is a widely accepted concept by national and international institutional and ad hoc arbitration. As Mr. Justice Brooking, in *Esso Australia Resources v. Plowman*, pointed out: “I think we should recognize a rule of law that it is an implied term of arbitration agreements (which the parties may exclude if they choose) that arbitrations should be heard in private in the sense of the absence of strangers as just defined unless the parties consent to the presence of a stranger.”¹

According to El-Awa, confidentiality means that access to arbitration information and documents is limited to a number of persons who need to access it for the purpose of the arbitration, regardless of their number, and denying this access to third parties, save for with all parties’ consent.² El-Awa states that confidentiality as a legal duty may be analyzed into five distinct elements: (a) its addressees; (b) the items (information/documents) covered by the obligation; (c) the time frame within which the obligation stands; (d) exceptions to this obligation, and (e) the consequences of breach.³

On the contrary the principle of publicity in court proceedings, according to Janevski and Kamilovska and Garašić, is realized through the following elements: (a) the presence of the citizens in the procedure before the court; (b) announcing the composition of the court; (c) publishing court decisions (d) publishing reports on the work of the courts; (e) publishing the remarks on the work of the court and (f) the possibility to review and rewrite documents.⁴

An agreement on confidentiality might cover, for example, one or more of the following matters: the material or information that is to be kept confidential (e.g. pieces of evidence, written and oral arguments, the fact that the arbitration is taking place, identity of the arbitrators, content of the award); measures for maintaining confidentiality of such information and hearings; whether any special procedures should be employed for maintaining confidentiality of information transmitted by

electronic means (e.g. because communication equipment is shared by several users, or because electronic mail over public networks is considered not sufficiently protected against unauthorized access); circumstances in which confidential information may be disclosed in part or in whole (e.g. in the context of disclosures of information in the public domain, or if required by law or a regulatory body.⁵

As for example, a typical confidentiality clause might say: “All aspects of (such) arbitration shall be conducted in the strictest confidence, and each party agrees not to disclose any information concerning any dispute or arbitration hereunder to any person except as may be required by law or this Agreement.”⁶

In this context, additional question arises: is there a difference among the concept of confidentiality and the concept of privacy in arbitration?

Richard Smellie gives an interesting answer to this questions. Namely, he claims that arbitration is private, but not confidential: arbitrations are private in that third parties who are not a party to the arbitration agreement cannot attend any hearings or play any part in the arbitration proceedings. Confidentiality – which is concerned with the parties’ obligation to each other not to disclose information concerning the arbitration to third parties (and the arbitrator’s like obligations to the parties) – does not apply to arbitration as an all-encompassing rule, and indeed in some circumstances will not apply at all.⁷

In the opinion of Trakman, the implied relationship between privacy and confidentiality has several competing features. One feature is that, if the conception of privacy in arbitration is to have commercial and procedural efficacy, it ought to be implied that parties have a duty to maintain confidentiality. This duty is not unlike the implied duty that arises in litigation. Another conception of the relationship between privacy and confidentiality is that the implied duty of confidentiality is inherent in procedure and arises out of long-standing custom and practice. This latter view holds that it is not privacy itself that provides protection from subsequent disclosure, but the efficacy of private arbitration.⁸

Privacy means excluding third parties from arbitral hearings. Only the arbitrators, parties to arbitration, their representatives and witnesses are to attend the arbitral hearings and to take part in the arbitration, save for with the parties’ consent.⁹ Consequently, confidentiality of arbitral proceedings, as opposed to privacy, does not refer to the ability of third parties to access and observe the proceedings without the consent of the disputing parties and possibly the arbitrator, but to the ability of the parties arbitrating, as well as others, to disclose documents and information used or related to the arbitration.¹⁰

Another interesting question is whether the concept of confidentiality is applicable in same manner in the investment arbitration as it is in commercial arbitration or there are some exceptions?

This issue is of particular importance, especially given the fact that “many investment arbitration cases involve public interest considerations that revolve around such issues as public health, the environment, and economic crises, and involve allegations of State misconduct and corruption making them often highly politicized and of direct interest to constituents.”¹¹

¹¹ Timothy Foden and Odysseas G. Repousis, Giving away home field advantage: the misguided attack on confidentiality in international commercial arbitration, *Arbitration International*, Oxford University Press, 2019, p.11

Trakman considers that exceptions to requirements of confidentiality are variously justified and they arise by agreement between the parties, through party practice and trade usage, or on account of express or implied legal duties.¹²

LEGAL FRAMEWORK OF THE PRINCIPLE OF CONFIDENTIALITY

Nowadays, it is undisputable fact that there is no consistent approach regarding confidentiality in international arbitration. There are different legal solutions adopted by national laws and by institutional arbitration rules. Perhaps, the only common feature amongst the sources which deal specifically with confidentiality is that all leave a broad margin to party autonomy.¹³

The arbitration rules of London Court of International Arbitration (LCIA)¹⁴ contain specific provision on confidentiality in article 30:

“30.1 The parties undertake as a general principle to keep confidential all awards in the arbitration, together with all materials in the arbitration created for the purpose of the arbitration and all other documents produced by another party in the proceedings not otherwise in the public domain, save and to the extent that disclosure may be required of a party by legal duty, to protect or pursue a legal right, or to enforce or challenge an award in legal proceedings before a state court or other legal authority. The parties shall seek the same undertaking of confidentiality from all those that it involves in the arbitration, including but not limited to any authorized representative, witness of fact, expert or service provider.

30.2 Article 30.1 of the LCIA Rules shall also apply, with necessary changes, to the Arbitral Tribunal, any tribunal secretary and any expert to the Arbitral Tribunal. Notwithstanding any other provision of the LCIA Rules, the deliberations of the Arbitral Tribunal shall remain confidential to its members and if appropriate any tribunal secretary, save as required by any applicable law and to the extent that disclosure of an arbitrator's refusal to participate in the arbitration is required of the other members of the Arbitral Tribunal under Articles 10, 12, 26.6 and 27.5.

30.3 The LCIA does not publish any award or any part of an award without the prior written consent of all parties and the Arbitral Tribunal.”

Additionally, article 19 par. 4 from LCIA arbitration rules regulate the private character of arbitration:

“All hearings shall be held in private, unless the parties agree otherwise in writing.”

International Chamber of Commerce (ICC) Arbitration Rules¹⁵ also includes special provision on confidentiality. Article 22 par.3 provides that:

“Upon the request of any party, the arbitral tribunal may make orders concerning the confidentiality of the arbitration proceedings or of any other matters in connection with the arbitration and may take measures for protecting trade secrets and confidential information.”

UNCITRAL Arbitral Rules (as revised in 2010)¹⁶ contain implicit provisions on confidentiality, in article 28 and article 34:

¹² Leon E. Trakman, Confidentiality in International Commercial Arbitration, Arbitration International, Volume 18 Number 1, LCIA 2002, p.16

¹³ Filip De Ly, Mark Friedman And Luca Radicati Di Brozolo, International Law Association International Commercial Arbitration Committee's Report and Recommendations on 'Confidentiality in International Commercial Arbitration', Arbitration International, vol. 28, no. 3 LCIA, 2012, p.359

¹⁴ <https://www.lcia.org/lcia-rules-update-2020.aspx>

¹⁵ <https://iccwbo.org/dispute-resolution-services/arbitration/rules-of-arbitration/>

¹⁶ <https://uncitral.un.org/sites/uncitral.un.org/files/media-documents/uncitral/en/arb-rules-revised-2010-e.pdf>

“28 (3) Hearings shall be held in camera unless the parties agree otherwise. The arbitral tribunal may require the retirement of any witness or witnesses, including expert witnesses, during the testimony of such other witnesses, except that a witness, including an expert witness, who is a party to the arbitration shall not, in principle, be asked to retire.”

“34 (5) An award may be made public with the consent of all parties or where and to the extent disclosure is required of a party by legal duty, to protect or pursue a legal right or in relation to legal proceedings before a court or other competent authority.”

On the other side, UNCITRAL Rules on Transparency in Treaty-based Investor-State Arbitration¹⁷ includes special provision for exceptions to transparency in article 7:

“Confidential or protected information

1. Confidential or protected information, as defined in paragraph 2 and as identified pursuant to the arrangements referred to in paragraphs 3 and 4, shall not be made available to the public pursuant to articles 2 to 6.

2. Confidential or protected information consists of:

(a) Confidential business information;

(b) Information that is protected against being made available to the public under the treaty;

(c) Information that is protected against being made available to the public, in the case of the information of the respondent State, under the law of the respondent State, and in the case of other information, under any law or rules determined by the arbitral tribunal to be applicable to the disclosure of such information; or

(d) Information the disclosure of which would impede law enforcement.

3. The arbitral tribunal, after consultation with the disputing parties, shall make arrangements to prevent any confidential or protected information from being made available to the public, including by putting in place, as appropriate:

(a) Time limits in which a disputing party, non-disputing Party to the treaty or third person shall give notice that it seeks protection for such information in documents;

(b) Procedures for the prompt designation and redaction of the particular confidential or protected information in such documents; and

(c) Procedures for holding hearings in private to the extent required by article 6, paragraph 2.

Any determination as to whether information is confidential or protected shall be made by the arbitral tribunal after consultation with the disputing parties.

4. Where the arbitral tribunal determines that information should not be redacted from a document, or that a document should not be prevented from being made available to the public, any disputing party, non-disputing Party to the treaty or third person that voluntarily introduced the document into the record shall be permitted to withdraw all or part of the document from the record of the arbitral proceedings.

5. Nothing in these Rules requires a respondent State to make available to the public information the disclosure of which it considers to be contrary to its essential security interests.”

Convention on the Settlement of Investment Disputes between States and Nationals of Other States¹⁸ does not contain explicate provision on confidentiality. Confidentiality is manifested through the article 48 par.5 that reads as follows:

¹⁷<https://uncitral.un.org/sites/uncitral.un.org/files/media-documents/uncitral/en/uncitral-arbitration-rules-2013-e.pdf>

¹⁸ <https://icsid.worldbank.org/sites/default/files/ICSID%20Convention%20English.pdf>

“The Centre shall not publish the award without the consent of the parties.”

Rules of the Permanent court of Arbitration attached to the Economic chamber of Macedonia¹⁹ are similar to UNCITRAL Arbitral Rules in relation to confidentiality. Specifically article 58 par.3 provides that

“The arbitral award may be published only upon accordance of both parties.”

CASE LAW: ESSO AUSTRALIA RESOURCES LTD. AND OTHERS V. THE HONOURABLE SIDNEY JAMES PLOWMAN AND OTHERS

Esso Australia Resources Ltd and BHP Petroleum (North West Shelf) Pty Ltd were parties to an agreement with the Gas and Fuel Corporation of Victoria (GFC) made in 1975 for the supply of natural gas to GFC. A similar agreement existed between the suppliers and the State Electricity Commission of Victoria (SEC) made in 1981. BHP Petroleum (North West Shelf) Pty Ltd subsequently assigned its rights and obligations under the 1981 agreement to BHP Petroleum (Bass Strait) Pty Ltd. Esso/BHP sought price increases under the agreements, and upon GFC and SEC refusing to pay the increases, the disputes were refer-red to arbitration. The Minister for Manufacturing and Industry Development commenced a proceeding in the Supreme Court of Victoria for a declaration that all information disclosed to GFC and SEC was not subject to any obligation of confidence. By counterclaim, Esso/BHP sought declarations, based on implied terms, that each arbitration **“is to be conducted in private and that any documents or information supplied by any of the parties to any other party thereto in or for the purpose thereof are to be treated in confidence as between each such party and the arbitrators and umpire except for the purpose of the arbitration”**. GFC and SEC made cross-claims against Esso/BHP for declarations in the same terms as those sought by the Minister.²⁰

In this case, the High Court explicitly held that under Australian law a general obligation of confidentiality cannot be regarded as implicit in an agreement to arbitrate. While acknowledging that privacy is an inherent feature of arbitration (in the sense that hearings are not open to the public), the Court held that confidentiality is not an

“essential attribute of a private arbitration imposing an obligation on each party not to disclose the proceedings or documents and information provided in and for the purposes of the arbitration

nor part of the ‘inherent nature of a contract and of the relationship thereby established.’ The Court did, nevertheless, acknowledge that an obligation of confidentiality could be imposed on the parties through express contractual provision.²¹

Considering the privacy of arbitration, the Court ruled as follows:

“Subject to any manifestation of a contrary intention arising from the provisions or the nature of an agreement to submit a dispute to arbitration, the arbitration held pursuant to the agreement is private in the sense that it is not open to the public. One writer has asserted that total privacy of the proceedings is one of the advantages of arbitration (5). The arbitrator will exclude strangers from the hearing unless the parties consent to attendance by a stranger (6). Persons whose presence is necessary for the proper conduct of the arbitration are not strangers in the relevant sense. Thus, persons claiming through or attending on behalf of the parties, those assisting a party in the presentation of the case, and a shorthand writer to take notes may appear (7). It does not matter much whether this characteristic of privacy is an ordinary incident of the arbitration, that is, an incident of the subject-matter upon which the parties have agreed, or whether it is an implied term of the agreement. For the most part, the authorities refer to it as an implied term. But, for my part, I prefer to describe the private character of the

¹⁹<https://www.mchamber.mk/upload/Rules%20of%20the%20Permanent%20court%20of%20Arbitration%20attache d%20to%20the%20Economic%20chamber%20of%20Macedonia%20-%20Unofficial%20consolidated%20text.pdf>

²¹ Filip De Ly, Mark Friedman And Luca Radicati Di Brozolo, International Law Association International Commercial Arbitration Committee's Report and Recommendations on 'Confidentiality in International Commercial Arbitration', Arbitration International, vol. 28, no. 3 LCIA, 2012, p.364-365

hearing as something that inheres in the subject-matter of the agreement to submit disputes to arbitration rather than attribute that character to an implied term."²²

Taking into consideration the confidentiality, the Court was of the view that:

"As the statement just quoted makes clear, the efficacy of a private arbitration as an expeditious and commercially attractive form of dispute resolution depends, at least in part, upon its private nature (9). Hence the efficacy of a private arbitration will be damaged, even defeated, if proceedings in the arbitration are made public by the disclosure of documents relating to the arbitration. As one text writer has observed (10):

"There would be little point in excluding the public from an arbitration hearing if it were open to a party to make public, for example in the press, or on television, an account of what was said or done at the hearing. It is suggested that a party would be entitled to an injunction to restrain the other party from such publication. And the same principle must apply to the arbitration as a whole, including the pleadings or statements of case, expert reports or witness proofs that have been exchanged, as well as to evidence given orally at a hearing."²³

CONCLUSION

Confidentiality and privacy are particularly important features of arbitration as an alternative dispute resolution mechanism. Although the principle of confidentiality is not uniformly regulated by legal norms, it is a universal concept and synonym for arbitration proceedings.

The private nature of arbitration is an indisputable fact. Confidentiality, on the other hand, depends on the party autonomy. Therefore, the principle of confidentiality reflects the contractual nature of the arbitration.

Today, the hybrid theory of the legal nature of arbitration is generally accepted. This means that arbitration has contractual and jurisdictional elements. However, confidentiality also applies in the jurisdictional part of the arbitration under the parties will autonomy.

Therefore, it can be concluded that will autonomy of the contracting parties creates the balance between confidentiality and transparency in the arbitration proceedings.

Although the principle of publicity is one of the elements of the rule of law, confidentiality in arbitration is one of the basic elements for its efficient functioning and acceptance.

In this regard, I consider that transparency in international investment arbitration should dominate in terms of confidentiality, especially if the public interest in the country is affected.

Generally speaking, the principle of confidentiality is an integral part of the arbitration process and it will be applied in the future, with some minor modifications.

The Latest Trends and Future Prospects For The Main Agricultural Sectors

Nataliya Stoyanova¹

¹University Of Agribusiness And Rural Development- Plovdiv, Bulgaria

Abstract: Agriculture is faced with increasing challenges and problems. Some of them we cannot control: world economy, climate change, weather extremes, abandonment of rural areas. What we can control is our capacity to work and our ability to overcome the health and safety problems with which we are faced. In this paper the OSH approach and performance in Bulgaria is discussed in the context of the wider EU approach to OSH and Agriculture and Rural Development policy. The demographics identified in agriculture in Bulgaria and across the EU, with an aging and generally untrained labour force, places distinct challenges to improving OSH within the sector and to the achievement of the EU 2020 Strategy and “Food Harvest 2014/2020” in Bulgaria

Key Words: partnership agricultural sector of Bulgaria

1. INTRODUCTION

Agricultural experts expect an increase in grain harvest in 2021, both in Europe and in the Black Sea region, which includes Bulgaria, Romania and Ukraine.

Wheat is expected to increase by 2% to a record 790 million tons, and the amount of corn will jump by nearly 5% to over 1 billion tons, which will also be a top achievement.

Grain consumption is expected to increase by 2.5% to over 2 billion tonnes. London analysts argue in their forecast with the growing need for cereals for human food, feed and industrial use.

This means that despite the record harvest, stocks in the largest exporting countries will increase by only 1 million to 144 million tons, mainly in the form of corn. The largest exporters of this crop are Argentina, Brazil, Ukraine and the United States. Leaders in wheat are Argentina, Australia, the European Union, Canada, Kazakhstan, Russia, the United States and Ukraine. The short-term outlook for EU agricultural markets in 2021 concludes that the EU agricultural sector is showing resilience during the Covid-19 crisis. The sector has performed relatively well thanks to increased retail sales and domestic consumption. In addition, the outlook is favorable with a dynamic global demand and resumption of food services (restaurants, bars, cafes), expected once the vaccination campaign is sufficiently advanced.

II. LITERATURE REVIEW

In structural terms, the transitional period has affected negatively the Bulgarian processes prestrukturiranje farms, their production orientation. In structural terms, the Bulgarian agriculture is characterized by you see a group of farms with a specific specialization:

A large group of small farms, mostly in animal husbandry and horticulture, the production of products with weak market potential and orientation.

Relative a group of large, improved substantially reserves, production activities, mainly in grain production and other cultures

A particularly strong influence on the development of production structures and podotrasli in the economy after 2007 has the current framework of the Common agricultural policy single payment on the surface, which provides different levels of support to these groups. This leads to a deepening of differences in development is the creation of products, performance, profitability, opportunities for prestrukturiranje and modernization.

Structural and commodity imbalance misrepresents the overall competitiveness of philarmoniada. In conditions of open market economy and globalization is becoming increasingly difficult to realize the existing potential of the industry production for which it has favourable conditions and traditions, and to

maintain food security in the country from internal resources. It is, after all, creates serious difficulties for processing facilities, which can not realize fully the potential high konkurentosposobnost because of the lack of quality raw materials.

This imbalance is amplified by the fact (according to INE, 2008) that the population in rural areas in the period 1972 – 2004. decreased from 1 million people, and then to 2008. with more than 180 000, and in relation to 2007.with 0.4%. The main factors of the declining population in rural areas have a negative natural increase and migration from rural to urban areas. The reasons for this were universal , but they are mostly serotta, income, infrastructure, health and education.

In this respect GSP for the period 2014-2020 reveals some opportunities, especially for small farms and areas unfavorable for agricultural activity conditions.

In this context, one of the most difficult problems to solve remains the question of whether the individual farms and small farmers (especially in hilly and mountainous areas) , whose production is expected to be linked to the creation of specific products (boutique and traditional) agriculture. In this respect GSP for the period 2014-2020 reveals some opportunities, especially for small farms and areas unfavorable for agricultural activity conditions.

III. THE LATEST TRENDS AND FUTURE PROSPECTS FOR THE MAIN AGRICULTURAL SECTORS

1. Polish cultures

Prices of all major cereals have risen, in line with global prices. World grain consumption is also expected to increase, mainly from the demand for animal feed. EU cereal production could reach 295.2 million tonnes in 2020/21, up 5.3% from last year.

Total oilseed production in the EU is expected to increase by 3.4% compared to last year and reach 16.7 million tonnes in 2021/22, despite severe weather conditions. As regards protein crops, production increased by 7.9% in 2020/21. In 2021/22, it may increase by a further 5.2%, mainly from domestic demand for food.

EU sugar production has reached a 5-year low, selling 14.4 million tonnes in 2020/21. This decline is mainly due to the widespread yellowing of the sugar beet crop in France. However, consumption must remain stable, leading to a reduction in stocks.

Fig 1. European Organization of Traders in Cereals

Good purchase prices of wheat will not be repeated this year, according to analyzes of experts in the production and trade of cereals. The levels of BGN 390-410 / ton of wheat, which together with the subsidies under all measures supporting agriculture provide an excellent yield, are about to be reduced in 2021.

The main reason for the expected lower wheat prices are data from the European Organization of Traders in Cereals, Oil Seeds, Vegetable Oils and Meal (COCERAL), which forecasts an increase in the grain harvest in the Member States of the European Union this year. from 5.2 million tons compared to 2020 to 283.48 million tons.

The largest growth is expected in the wheat harvest in France - 36 million tons, with realized 29.2 million tons of yields in 2020.

The forecast for Germany reaches 23 million tons out of 21.9 million tons, while for Poland a slight decline to 11.05 million tons from 11.9 million tons is forecast. EU wheat yields in 2021 are expected at 5.82 tonnes per hectare compared to 5.75 tonnes per hectare last year. The sown areas with cereals are projected to expand to 21.7 million hectares from 20.6 million hectares last season.

Data for the UK are given separately for the first time since leaving the EU, with soft wheat production rising to 14.9 million tonnes after last year's extremely weak 9.5 million tonnes. Yields are expected to increase to 8.2 tonnes per hectare from 6.96 tonnes per hectare last season. The experts of the trade organization also envisage a significant expansion of the sown areas with wheat in Great Britain this season to 1.8 million hectares from 1.3 million hectares last season.

For maize, EU production is estimated to grow to 63.5 million tonnes, compared to 62.3 million tonnes harvested last year. A richer harvest is expected in France - 14.2 million tons compared to 13.4 million tons in 2020, in Romania - 11.7 million tons compared to 9.6 million tons last year, and in Bulgaria - 3.8 million tonnes compared to 3.5 million tonnes in 2020. At the same time, for some of the main producers of cereals in the EU, a decline in the harvest is forecast - up to 7.3 million tonnes from 8.3 million tonnes in Hungary, up to 5.8 million tonnes out of 6.1 million tonnes in Italy, up to 3.4 million tonnes out of 3.8 million tonnes in Germany and up to 4.1 million tonnes out of 4.2 million tonnes in Poland. The average yield of maize in the EU is projected to increase to 7.23 tonnes per hectare from 7.08 tonnes per hectare in 2020, but with a slight contraction of the area to 8.78 million hectares sown last season 8, 81 million hectares.

COCERAL analysts also forecast an increase in the harvest of oilseeds in the EU this year to 29.6 million tons from 28.4 million tons in 2020. The estimate for all three major crops is for production growth - up to 16.5 million tons of 16 million tons of rapeseed, up to 9.9 million tons of 9.2 million tons of sunflower and up to 3.1 million tons of 3.07 million tons of soybeans.

2. Specialized crops

In 2020/21, olive oil in the EU could reach nearly 2.1 million tons, which is 10% more than in 2019/20. Following an increase in 2020, EU consumption may continue to increase by an additional 3% in 2020/21. Thanks to this growth and the expected stable exports, olive oil prices can continue to recover.

As regards the wine sector, EU wine production is expected to remain stable at around 158 million hectoliters in 2020/21. Domestic use may increase by 2% due to "other uses" such as crisis distillation. With exports expected to increase, these developments could lead to a reduction in wine stocks and a better market balance for the sector.

Apple production in the EU remains stable for 2020/21 and amounts to 11.5 million tonnes. With increased consumption at home during the Covid-19 pandemic, per capita consumption of fresh apples is expected to remain high at an average of 15.4 kg. per person.

The production of oranges in the EU 2020/21 amounted to 6.6 million tons and was 8% higher than the previous year. After high demand for fresh oranges in 2020, consumption is expected to remain high in 2020/21 at 12.9 kg per person

3. Milk and milk products

EU milk production is expected to increase by 1% in 2021, thanks to increased yields, while the number of dairy herds is expected to continue to decline.

Consumption of cheese and butter in the EU may increase, in particular from the reopening of food services, and retail sales must remain higher than before Covid-19. In terms of production, EU cheese is expected to absorb 21% of the additional milk produced in 2021.

Consumption of fresh dairy products is expected to decline after the peak in 2020, but is likely to remain above pre-Covid-19 levels.

4. Meat

Beef production in the EU fell by 1.2% in 2020 and is expected to continue to decline by an additional 0.9% in 2021, despite a recovery in demand in the second half of 2021, suggesting a gradual opening of restaurants and the return of tourism.

As regards the pigmeat sector, production increased by 1.2% in 2020 due to exports. However, after two years of impressive growth, exports will decline as the Chinese pork sector slowly recovers from African swine fever (ASF). This will lead to slightly lower production in 2021 (-0.7%).

In 2020, poultry production in the EU increased by 1% and is expected to maintain similar growth in 2021 (+ 1%). The sector has been affected by avian influenza, found in 18 EU countries, along with the closure of food services due to Covid-19, which also weighs on the market. However, a slight recovery in exports should be observed in 2021, with export bans (related to bird flu) expected to be lifted gradually.

Sheep and goat meat production in the EU increased by 2% in 2020. However, production is expected to decrease by 1% in 2021 due to a decline in herd size and less slaughter on farms in Romania and Bulgaria. Lower availability of sheepmeat on the domestic market could lead to higher prices in the EU.

IV. CONCLUSIONS

Good purchase prices of wheat will not be repeated this year, according to analyzes of experts in the production and trade of cereals. The levels of BGN 390-410 / ton of wheat, which together with the subsidies under all measures supporting agriculture provide an excellent yield, are about to be reduced in 2021.

The main reason for the expected lower wheat prices are data from the European Organization of Traders in Cereals, Oil Seeds, Vegetable Oils and Meal (COCERAL), which forecasts an increase in the grain harvest in the Member States of the European Union this year. from 5.2 million tons compared to 2020 to 283.48 million tons.

The largest growth is expected in the wheat harvest in France - 36 million tons, with realized 29.2 million tons of yields in 2020.

The forecast for Germany reaches 23 million tons out of 21.9 million tons, while for Poland a slight decline to 11.05 million tons from 11.9 million tons is forecast. EU wheat yields in 2021 are expected at 5.82 tonnes per hectare compared to 5.75 tonnes per hectare last year. The sown areas with cereals are projected to expand to 21.7 million hectares from 20.6 million hectares last season.

The Pavidemia Kovid -19 And Macroeconomic Consequences

Prof. Ogniana Stoichkova, PhD¹

¹University of Agribusiness and Rural Development, Plovdiv, Bulgaria

Abstract: The Kovid-19 pandemic has dealt a severe blow to the world economy. No country was left without serious consequences, which were reflected in very slow economic growth. The publication provides a historical overview of the pandemics that humanity has gone through since the 14th century. In addition to the hundreds of thousands of victims who take pandemics, there is a dependency that shows that a long period of economic recovery is needed after each pandemic. What are the medium- and long-term effects of pandemics? How are they different from other economic disasters? Based on the historical approach, following the major pandemics since the 14th century and observing the levels of return on assets, it is concluded that the macroeconomic consequences of pandemics have been going on for decades. Real rates of return have been significantly suppressed, in stark contrast to what happens after a state of war. The fidelity of the neoclassical model of growth is proved: capital was destroyed during wars, but not during pandemics. Pandemics can cause relative labor shortages and / or shifts to higher levels of savings. The most pronounced macroeconomic consequences are the prolonged retention of low interest rates, accompanied by long-term stagnation of the macroeconomy. At the same time, there is an increase in wages. In such a context, the role of governments in financing various measures aimed at strengthening macroeconomic stability is growing.

Key words: pandemic, medium and long-term effects of pandemics, macroeconomic consequences of pandemics, neoclassical function and pandemic

1. Introduction

The impact of the COVID-19 pandemic on economic activity from 2020 to now has been assessed by experts as the beginning of a deep economic and social crisis worldwide. Governments and economists hope that, despite the rapid and unprecedented collapse of production, trade and employment, it is possible to weaken these processes as the pandemic begins. Historical data provide evidence that long-term economic consequences can occur over a generation or more.

Such consequences are - the long period of low real interest rates, accompanied by long-term stagnation, which can also last two or more decades. In this fact there is a good trend - such long periods of low interest rates and production are associated with higher real wages. This creates ample opportunities for governments to fund incentives to address the economic losses caused by the pandemic. As I. Nikolova rightly emphasizes, "when conducting economic and financial policy in a country, especially when planning activities for future periods... the individual elements of these policies... are analyzed by the budget for a possible increase in the costs of implementing macroeconomic policies"¹

It is noteworthy that so far the study of the economic consequences of the ongoing COVID-19 pandemic has focused on the short-term results of the mitigation strategy and facilitation. It seems to a lesser extent that strategic tasks are set for fiscal programs aimed at combating the pandemic. In our opinion, it is very important not to lose sight of what the economy will look like in the coming years and decades.

2. History of pandemics

If we look at previous pandemics, beginning with the Black Death in the 14th century², we can learn important lessons about the possible medium- and long-term economic consequences. Of course, when

¹ Nikolova, I. (2018) Valutniyat risk v ikonomikata. NBU, p.91

² The plague in the 14th century killed half of Europe's population and almost 10 percent of the world's population. This is the deadliest and first pandemic to affect almost every part of the globe. More than 20 million people die from the Black Death.

we draw conclusions based on historical trends, we must take into account a very important difference. Past pandemics, as well as the aforementioned "Black Death", have manifested themselves in times when virtually no one lived to old age. Taking into account the increased life expectancy, it is possible to identify important features in the current situation. For example, mortality from COVID-19 has been disproportionately strong, affecting older people more, who are generally already out of the active workforce and tend to save more money than young people.

When studying historical data, as a rule, an event that occurs in one country or one region is considered. Local results are monitored, for a maximum period of at least ten years. At the same time, when the pandemic erupts into very large ones, the consequences spread to the whole economy or to the whole region. There are at least two reasons for this:

- or because the infection itself is widespread,
- or because trade and market integration are ultimately spreading economic turmoil.

Interesting data are presented in their study by professors from the University of California Oscar Jorda, Sanjay Singh and Alan Taylor (2020). They have taken a global look at the macroeconomic consequences of the pandemic in a number of European economies. It is interesting and instructive to review the consequences of 15 major pandemic events, each of which led to the loss of at least 100,000 human lives - Table №1.

Table №1. Information on the victims of 15 world pandemics

Pandemic	Begining	End	Number died
The black plague	1331	1353	75 000 000
Italian plague	1623	1632	280 000
The Great Plague in Seville	1647	1652	2 000 000
The Great Plague in London	1665	1666	100 000
The Great Plague in Marseilles	1720	1722	100 000
First cholera pandemic	1816	1826	100 000
Second cholera pandemic	1829	1851	100 000
Cholera in Russia	1852	1850	1 000 000
World flu epidemic	1889	1890	1 000 000
Sixth cholera pandemic	1899	1923	800 000
Encephalitis pandemic	1915	1926	1 500 000
Spanish flu	1918	1920	100 000 000
Asian flu	1957	1958	2 000 000
Hong Kong flu	1968	1969	1 000 000
Swine flu	2009	2010	203 000

Source: Alfani and Murphy (2017) Taleb and Cirillo(2020) available at https://en.wikipedia.org/wiki/list_of_epidemics

Historical records show that the world has gone through at least fifteen severe disease pandemics and the average death toll is at least 100,000 for each pandemic.

Using data on the profitability of long-term government debt dating back to the 14th century (Schmelzing, 2020), we can trace the response of the so-called real (net of inflation) natural interest rate in Europe after a major pandemic. Below, the term "natural interest rate" is simply used.

Economists speak of a natural or neutral interest rate as an equilibrium level that will allow the economy to grow at its potential rate when inflation is stable. In the long run, the natural rate of interest is determined by the relative demand and supply of borrowed funds by savings holders and borrowers.

The natural interest rate serves as an important economic barometer. For example, when the population prefers to postpone consumption and save, the relative supply of savings increases; when the rate of economic growth slows down, investment becomes less attractive - in both cases the natural interest rate decreases, restoring equilibrium.

Fig.1 Interest rates during wars and epidemics

Source: Jorda, Singh and Taylor (2020)

As it is shown in Fig.1, pandemics have a long-term impact on interest rates. About 20 years after the pandemic, the natural interest rate response has shifted down by almost 1.5 percentage points. In comparison, this decline is comparable to that which occurred from the mid-1980s to the present day. It has also been found that it takes another 20 years for the natural norm to return to its previous levels.

3. Consequences of epidemics

These results are indicators and illustrate the great economic impact of the pandemics observed in recent centuries. It is well known that after severe declines caused by financial crises, real safe interest rates, which are closely linked to natural interest rates, can remain low for 5-10 years (Jorda, Schularick and Taylor, 2013). But in this case the duration of the reaction is even more pronounced. The data presented in fig. 1 are in line with the well-known neoclassical growth model. Robert Solow and Trevor Swan first introduced the theory of neoclassical growth in 1956. The theory states that economic growth is the result of three factors: labor, capital, and technology. While the economy has limited resources in terms of capital and labor, the contribution of technology to growth is limitless. The loss of labor without the parallel destruction of capital leads to a balance of relative labor income and capital income.

The resulting pandemic decline in interest rates may also be exacerbated by increased savings from pandemic survivors. They are most often driven by a desire to maintain and stabilize their well-being or try to save, driven by the motive of prudence. If this explanation is true, then we must see a very different pattern resulting from a completely different type of historical event, which also leads to enormous human casualties. It's about the state of war. Like pandemics, major armed conflicts lead to the destruction of crops, land, buildings and equipment, generally speaking, to the loss of capital. For a more in-depth analysis, the initial estimates can be extended to include major military actions that cause heavy casualties, severe losses of land, buildings and other traditional forms of capital.

The results show quite emphatically that in times of war the relative loss of capital in relation to the labor force leads to a reaction of interest rates to rising rather than falling. This is shown in Fig.1. Wars, as a rule, lead to an increase in real interest rates for 30-40 years. If the neoclassical mechanism is correct, then this would be another aspect in which the consequences of a pandemic manifest themselves. To the extent that the labor-capital ratio decreases, the natural rate of interest rates must fall and the real wage must rise.

Fig.2 Sustainable economic growth

Source: Jorda, Singh and Taylor (2020)

In Fig.2 is illustrated the response to real wages under the influence of the pandemic. It shows the trend of how it gradually increases over the decades after the pandemic. After 40 years, real wages have risen by about 10 percent or more. These data illustrate a pattern that corresponds to the logic of neoclassical models of economic growth.

4. Factors for counteracting the decline in profitability

The major historical pandemics of the past millennium are, as a rule, associated with a subsequent low return on assets. If we evaluate them in terms of deviations in the natural interest rate, the results show that the pandemics were followed by long periods - over several decades - with reduced real interest rates. This may reflect a lack of necessary investment (due to excess capital and reduced labor), an increased desire to save (out of caution, greater uncertainty, or a desire to recover depleted wealth), or both.

If the historical trends that emerge from past pandemics emerge in a similar way after COVID-19, then long-term stagnation (Summers, 2014) will be a serious problem in shaping monetary and fiscal stabilization policy over the next two or more decades. .

There are at least three factors that are likely to weaken the decline in the natural rate of interest rates.

First, if current health and public health measures are more effective, the number of victims of COVID-19 relative to the general population may be less than the number of victims of some of the major pandemics in the past.

Secondly, COVID-19 mainly affects older people who are no longer engaged in the workforce and tend to save relatively more than young people, which is a remarkable difference from past centuries when people's life expectancy was shorter .

Third, active fiscal expansion to tackle the pandemic will have an additional impact on public debt growth. This in turn will reduce interest rates on savings and possibly put pressure on real interest rates.

5. Conclusion

In net terms, we still expect the period of low real interest rates to be extended (although this effect will be weakened by the factors considered). In this case, low real interest rates must provide governments with the budgetary space needed to actively mitigate the impact of the pandemic.

Abstract: For a long time now, social and political liberalism has been accepted as the desirable basis for societal organization. The economic theory has tried to adapt itself to this perspective and has developed sophisticated models to support the claim that individuals will self-organize into a socially desirable state. This position, however, has led to a view of the economic system that is divergent from the developments in other disciplines. While statistical physics, social psychology, and ecology have forged ahead with non-linear dynamics and complex interactions between individuals, economists have insisted on an analysis that is focused on “**optimizing behavior of fully rational and well-informed individuals in a static context and equilibria that result from that optimization**”. This is a basic paradigm on which standard economic models and modern economic theory are built. Neoclassical economics is indeed a meta-theory that provides a framework in which many different approaches are possible. Ultimately, however, they all rest on the same assumptions of individualism, rationality, and equilibria. Besides, the constant appearance of economic crises shows that there are real problems with the analysis itself. While each crisis calls forth a new approach to economics, experience shows that inertia has ultimately prevailed among the scholars, and economics restores to the path that it was already following. Neoliberals removed the complexity from the real world and developed models that, by the method of comparative statics, allow for policy debate and policy choices. Without neglecting how far the economic thought has already brought us, the main point is that fundamental principles of rationality and general equilibrium do not precisely describe the reality. The new sciences of complexity can provide deeper understanding into the way groups of people behave when they (re)act together to shape the socio-economic system. This system is characterized by tipping points, non-linearities, asymmetrical relations, trade-offs, interlinkages and all other attributes of complex systems, making them difficult, if not impossible, to comply with the existing theory. But then again, do we need a generalized, coherent and simplified theoretical representation of the world? Not always! The policymakers would probably be better off if they adopt more eclectic and experimental approach driven by big data, artificial intelligence and machine learning. This paper provides an overview of the latest research on policy-making beyond neoliberalism.

Keywords: crisis, general equilibrium, prediction, networks, complex systems

1. INTRODUCTION

There is no doubt that recent events have led to the emergence of a new trajectory that goes far beyond the prevailing paradigm of growth driven by globalization. This has been seen in the new directions of American economic policy, Brexit and tensions in the European Union, China's rising position in the global economy, as well as the growing inequality in developed and even upper-middle-income countries. Additionally, many segments of national economies have been transformed by rapid technological change. The development of automation, especially artificial intelligence, is changing the number (and type) of jobs and the way they are organized, which in turn raises concerns about the "future of jobs". In a wide variety of sectors, transnational corporations, including digital platforms, have reached a point of an exceptional market power, highlighting questions about the economic and social impact they produce, as well as their implications for public policy (OECD, 2019a). At the same time, trade and investment continue to move south and east of the world as a result of the complex global production networks (World Bank & World Trade Organization, 2019). National financial regulations are hampered by the combination of a global financial system and novel financial technologies (Agénor & Pereira da Silva, 2019).

Whatever the situation, these challenges could have a profound impact. However, they come after a period in which many countries have much lower performance than those observed in the past. The size and effects of the 2008 Financial Crisis, accompanied by the absence of an early warning system, has greatly surprised the economics profession (Gertz, G. and Kharas, H. (eds) (2019). Obviously, the traditional treatment of environmental degradation and income inequality as externalities or marginal

market failure, the unrestricted pursuit of growth and consumption, and the claim that individuals left to their own will self-organize into a socially desirable state are part of the problem. There has been a steady rise in inequality, and thus a reduction in social cohesion and erosion of growth and prosperity. Many of the policies that have been implemented over the last decades have proved inadequate to improve economic and social performance. In an age where low interest rates and low growth rates seem to be quite entrenched - a phenomenon sometimes explained as a "secular stagnation" (Teulings & Baldwin (eds), 2014) - it appears that monetary policy alone is not able to produce a response. This, in turn, leaves very little room for policymakers to tackle another recession (The Economist, 2018). As the knowledge-based economy becomes more digital, and the divide between highly innovative firms and those lagging behind deepens, new approaches are needed to increase productivity and reduce inequality (OECD, 2019b).

In the run-up to 2008 Financial Crisis, the economic model (often depicted as "Washington Consensus") was strongly determined by a specific form of economic analysis. Built around the orthodox version of 'neoclassical' economic theory, this model has assigned a priority to liberalized markets as a means of optimizing the economic well-being. The 2008 Financial Crisis was actually a wake-up call on the shortfalls of the traditional economic models. It has emphasized the need to observe the economic policy with more critical approaches and disclosed the limits of prevailing structural analysis tools to consider the key linkages, trade-offs and feedbacks. In fact, the crisis has sparked a debate on whether the current economic models and analysis can be incrementally improved (to integrate emerging knowledge and missing ideas - for example, by incorporating "limited rationality") or there is a need for a complete paradigm shift (Hynes, Lees & Müller (eds.), 2020).

This manuscript argues that economics will not be able to evade a radical move, primarily due to the fact that socio-economic system is swapping and self-organizing in a way that is very difficult, or even impossible, to conform with the existing theory. It is necessary to seize the opportunity to develop a new understanding of the economy as an increasingly complex system that is continually evolving and is neither in, nor converging towards a steady state. Hence, forecasting cannot be rooted on extrapolation from the past or the analysis of behavior of an isolated 'representative' individual or firm (Hynes, Lees & Müller (eds.), 2020). Without pretending to neglect the farsightedness in the achievements of economic thought, our central motive is focused on the idea that the underlying principles of rationality and general equilibrium do not represent reality in exact terms. Notwithstanding the great knowledge about the mechanisms of growth gained by models of Solow (1956) and Ramsey (1928), the emphasis on homogenous agents makes the linkages between economic development and inequality significantly under-researched. What is required is a systems approach to integrate the evolution, emergence, tipping-points, interlinkages, synergies, trade-offs and other features of the systems. Hence, the next-generation systems analysis models need to better conform the real-world dynamics (e.g., social and behavioral heterogeneity) and thus, facilitate the assessment of systemic impacts and effectiveness of policies.

The rest of the paper is organized as follows. Section 2 summarizes the dominant economic paradigms and narratives. Section 3 outlines the need to embrace a transdisciplinary perspective, or a 'complexity economics' that is significantly different from traditional perspective of economics. Section 4 answers the question of what to expect from the next-generation systems analysis models. The last section concludes and recommends.

2. DOMINANT PARADIGMS OF ECONOMIC POLICY

Policy makers become quite intimidated when they have to think about a fundamental change in the way they create policy. But these changes have occurred twice before in the last century when two dominant schools were observed. The collapse of Wall Street in 1929 and the Great Depression contributed to establishing the Keynesian economics as a governing paradigm. This theory has offered better solutions in terms of economic recovery, while the economic policies of full employment have gained widespread support across the political ambit. This situation produced a wide range of government intervention in the markets and establishment of a welfare state. Nevertheless, during the 1970s the economy encountered a stagflation, that is a simultaneous occurrence of economic

stagnation and high inflation. Keynesian economic theory has failed to provide solutions to this problem, nor to offer explanations about the oil crisis and other shocks. Consequently, the Chicago School provided an alternative and a new paradigm of neoclassical economics (Hynes, Lees & Müller (eds.), 2020). The free market, or "neoliberal" model, developed by Milton Friedman and Friedrich Hayek seemed to provide a better economic analysis and more dynamic policy instructions.

For about thirty years up to the 2008 Financial Crisis, the dominant model of economic growth was based to a great extent on a certain form of neoclassical economic theory. In this context, there are relatively simple assumptions about the behavior of economic actors and the consequent implications for the economy as a whole. At the core of this theory is the assumption of "rational" economic behavior; individuals maximize their own utility, and firms try to maximize their profits. Hence, the "optimal" level of output and consumption (as well as wages and profits) would be attained in markets where there are as many competitive conditions as possible. In areas of labor market policy, international trade and financial markets, the dominant policy view is that markets should, if possible, be liberalized to rise their efficiency and accomplish the greatest overall benefits in output and welfare.

Most macroeconomic models before 2008 commonly assumed that households and firms behave in a homogeneous way and thus, they could be modeled as "representative agents" (Oxford Review of Economic Policy, 2018). Despite the possibility of frictions to individual markets, the economy, in the long run, tends to move towards an equilibrium state (under the usual assumption of full employment). By the way, shocks are considered to be exogenous, that is they come from outside the system. At the policy level, the neoclassical framework supported the view that high levels of government debt "crowd-out" private investment, so there should be a limited fiscal deficit, while monetary policy should be central to controlling inflation and managing aggregate demand (Goodfriend & King, 1997).

The social sciences outline these points of economic change as a "paradigm shift" - a period when old orthodoxy does not seem to provide a proper explanation or policy solutions to crisis-related conditions, and therefore a new approach is needed (Laybourn-Langton & Jacobs, 2018). At a time when more than a decade (after the global financial crisis) the world economy and most individual countries are facing multiple crises, probably, as the OECD will point out (especially through its New Approaches to Economic Challenges initiative): "the time is ripe for another such paradigm shift" (OECD, 2019c) - "A paradigm change centered on the idea of the economy as a complex adaptive system" (Hynes, Lees & Müller (eds.), 2020). This new approach will not only call for an appropriate theoretical framework, but also for a wider range of tools that will adequately reflect the outcomes of the current world.

3. TOWARDS A NEW NARRATIVE FOR A COMPLEX AGE

The outbreak of the latest coronavirus pandemic was actually a perfect example that we are not living in a linear world where actions bring about predictable reactions (Hynes, Linkov & Trump, 2020). Obviously, one of the greatest lessons from the crises is that the socio-economic system is rapidly evolving and moving further away from the old basic economic model. Any effort to "reform" the economy in a way that makes it similar to this model is unlikely to help. The framework that has dominated policy-making in the last few decades is no longer able to produce solutions to the challenges we face today. We need a much better analysis of the system as it is, and not as we would like it to be (Gertz & Kharas (eds), 2019). That's why complexity researchers, including Brian Arthur, Dooyne Farmer, Ricardo Hausmann, Alan Kirman, and others, call for a faster transformation in economic thinking: "We believe that in order for economics to progress, it needs to fully embrace a transdisciplinary approach and modernize a number of its key concepts" (Beinhocker et al., 2019). The authors point out that what is commonly referred to as the "economy" actually represents "a highly complex, multilevel system that encompasses human biology, human behavior, group behavior, institutions, technologies, and culture, all mutually entangled in networks of nonlinear, dynamic feedback. Each of these levels in the system is subject to learning, adaptation, evolutionary, and coevolutionary processes, which means that the system is constantly changing, self-creating, and never at rest. These dynamics in turn create system-level emergent behaviors, including economic growth, inequality, and financial booms and busts. The whole system, in turn, is deeply embedded in the physical processes of our planet" (Beinhocker et al., 2019). To better 'cope' with this complex system,

the transdisciplinary approach of “complexity economics” differs markedly from traditional views of economics (Arthur, 2014). First, the complexity economics does not follow the concept of rational choice. While behavioral economics critique of a rational actor becomes mainstream (Naidu, Rodrik & Zucman, 2019), the economic modeling persists in applying the assumptions of rational choice. However, many empirical and experimental studies show that economic and political preferences are strongly affected by the moral and social considerations. Frequently, these preferences do not correspond to the standard economic views of self-interest and rationality. “**Homo sapiens** looks almost nothing like **homo economicus**. Instead of asocial, transactional, self-regarding utility maximizers, real humans are intensely social, highly cooperative, and other-regarding creatures who make decisions inductively, heuristically, mimetically, and through group reasoning” (Beinhocker et al., 2019). Second, complexity economics differs in its perceptions on heterogeneity. The traditional economy with its concept of “representative household / representative firm” completely misses the heterogeneity. In this context, issues such as economic inequality may have some importance in terms of social justice, but not for economic reasons. There has been a recent resurgence in inequality-related research, and many economists who address issues of inclusive prosperity have made significant contributions to this work. However, much of this work is based on empirical observation of the past, with researchers critically examining the question ‘What happened?’. “Economics has yet to grapple with the harder question of how to integrate heterogeneity into its theoretical core and into the models used by policymakers to better answer the questions ‘why did it happen?’ and ‘what do we do?’. In contrast, explicit modeling heterogeneity is central to the complexity economics agenda” (Beinhocker et al., 2019). Finally, the third difference lies in the systems-level view of the economy. That is to say, exempt for some non-traditional economists, 2008 Financial Crisis was by and large not predicted. The crisis has occurred endogenously from within the financial system, which runs counter to economic predictions that usually take only exogenous shocks disturbing the general equilibrium (Hynes, Lees & Müller (eds.), 2020). This would require a systems approach that represents a paradigm shift in economic thought and move towards network models, agent-based modelling, and machine learning.

4. WHAT IS TO BE EXPECTED FROM NEXT-GENERATION SYSTEMS ANALYSIS MODELS?

Statistical models often have the advantage of medium complexity, as such models explain directly the properties of aggregate economic variables. This approach has lost acceptance in recent decades since it may lead to uncertain results (as underlined by the Lucas Critique) (Lucas, 1976). However, statistical modeling persists as an important approach in constructing large-scale macroeconomic models and empirical research related to aggregate phenomena. Structural models represent a dominant approach to examine macroeconomic issues, especially through both types of general equilibrium models, such as dynamic stochastic general equilibrium (DSGE) and computable general equilibrium (CGE) models.

Next-generation systems analysis models need to better take into account the real-world dynamics (e.g., social and behavioral heterogeneity). This would help in representing the social dynamics and complex collective decision-making and thus, facilitate assessing the effectiveness and systemic impacts of policies. Mainstream modeling approaches often focus on stylized assumptions, but do so at the expense of the comprehensive behavior of modeled systems. Given the current computing power, data availability, and knowledge about the bounded rationality, it is tempting to somewhat relax the simplified assumptions of the mainstream models in order to better reflect the real events. One of the innovative dimensions is to integrate the prevailing modelling tools from different disciplines (e.g., environmental models with economic growth and trade models). This would help to extend the boundaries of modeled items and allow for a wider range of interactions that may disclose indirect vulnerabilities or strengths of policy interventions (Hynes, Lees & Müller (eds.), 2020). Additionally, opportunities to reinforce the modeling capacities beyond the integration of existing tools may include a range of new applications, innovative methodologies and tools in many important areas, such as (Hynes, Lees & Müller (eds.), 2020):

- *Multiplicity of agents with strategic interactions.* Evolutionary game theory can be applied to explain the behavior of agents pursuing their own interests by making strategic decisions based on the observation of other agents. Frequently, the consequent strategic interactions among agents lead to social dilemmas that are collectively known as the

"tragedy of commons". This phenomenon is highly relevant for managing the key challenges of many common goods on which humanity depends (for example, this approach has been applied to designing the innovative incentive systems for the protection of common goods and analyzing the institutional corruption threats (Lee et al., 2019)).

- *Bounded rationality, including consumption preferences and consumer choices.* Behavioral economics and agent-based models highlight and utilize the fact that individuals act in ways that are not entirely rational. For example, instead of acting independently (as already assumed in mainstream economics), people can make decisions based on the perceived or actual behavior of others. Agent-based models are developed on the assumption that numerous agents interact according to simple behavioral rules in a well-defined environment. Individual behavior, interactions, and changes in their structure can produce system dynamics (including high levels of complexity). Normally, agent-based models can only be solved through simulations, but increased computing power has made this approach feasible even for large-scale models. These and other simulation models are used in proposing instruments to decrease financial systemic risk (Poledna & Thurner, 2016), in analyzing transport systems and also in observing the interaction between the real economy and the financial system.
- *Complex interconnections and systemic risks.* Network theory shows that a system's structure, in the context of the linkages between its elements, is important in determining responsiveness to exogenous shocks. This theory also advises how to use information about an agent's position in the network in order to define appropriate policies and activities for that specific agent. Compared to the mainstream models that count on the simple or uniform interactions among agents, network theory provides an insight for more realistic relationships (for example, some agents in the network are better connected to others or have a central position in the network as a whole (Kostoska & Kocarev, 2019; Kostoska et al., 2020)). Given that the network structure determines the scope of shock transmission (Acemoglu et al., 2012; Acemoglu, Akcigit & Kerr, 2016; Kharrazi et al., 2017; Carvalho & Tahbaz-Salehi, 2019; Kostoska, Stojkoski & Kocarev, 2020), policy interventions can be designed to change this structure in order to obtain a desired result.

5. CONCLUSIONS

The growing complexity and interdependence have made the economic, health, cyber and other systems vulnerable to extensive, irrevocable, and cascading failure. There is no doubt that the system we encounter in economics is changing very rapidly, in part as a result of the conscious choice of its constituents, which in turn makes it much less predictable than biological or physical systems. The whole socio-economic system has almost nothing to do with what existed in previous centuries, and it is in vain to believe that there is a comprehensive framework based on 19th-century liberal principles that embodies the rules by which the system will function. Efforts to reform the economy in a way that resembles the old basic economic model will not help. The complexity of economy and uncertainty of future events require a paradigm shift in economics. As a matter of fact, there is no need to develop this paradigm from scratch. It is based on the modern science of complexity, neo-Austrian Economics, as well as the work of Keynes and Knight and certain aspects of cognitive psychology. This alternative paradigm emphasizes the importance of certain methods and analytical techniques, including narrative techniques, network analysis, nonlinear dynamics, evolutionary logic, historical analysis, (reverse) stress testing, etc. The integration of existing tools and the application of innovative methods will be extremely important in making new insights into policy actions (for example, they may help map out causal links that are not well articulated in traditional models, such as feedback between economic activity and natural resources). These enhanced modeling approaches are becoming increasingly viable, primarily as a result of the rising computing power that facilitates the solving of complex models or simulating the behavior of a large number of agents. Detailed models can be accompanied by stylized models that provide useful qualitative understanding and help strengthen the intuition and ability of researchers and policymakers to better understand the ways in which economic, social and environmental systems

behave and interact. However, despite the significance for next-generation models, the incorporation of social sciences and of heterogeneity among agents also imposes certain challenges. First, behavior is almost always specified according to a certain context, which in turn means that data requirements to quantify behavior are frequently too large and hard to generalize. Second, system-level properties can be extremely sensitive to detailed assumptions about the behavior, so the model makers must improve their understanding of those sensitivities and their consequences. Finally, the models must be formally validated on a routine basis, and this, in turn, may impose certain challenges due to a great uncertainty and lack of precision of the existing econometric tools. However, the increasing availability of significant data provides a solid base for calibrating complex tools, including network and agent-based models.

The use of social media in the time of COVID-19 crisis: The case of Slovak local self-government

Ondrej Mital¹

¹ Pavol Jozef Šafárik University in Košice, Faculty of Public Administration, Department of Public Policy and Theory of Public Administration, ondrej.mital@upjs.sk, ORCID: 0000-0003-3773-8714

Abstract: Regarding the constantly growing importance of social media, public administration tries to find optimal solutions, which might help to increase the qualitative aspects of governance processes. The aim of this study is to analyze Facebook profiles of eight regional cities in Slovakia, focusing on the informational activities in the time of the COVID-19 crisis. The selected methodology aims to perform an in-depth content analysis of Facebook page usage in 2020. The main finding is based on the statement that selected group of Slovak regional cities have used their official Facebook pages to inform and to manage their citizens during the COVID-19 pandemic. This statement is also confirmed by the increased activity connected with sharing of posts during key periods of 2020 in the conditions of Slovak Republic, mainly the first wave of coronavirus in March and the mass testing of citizens at the end of October and the beginning of November. Another benefit of the article is also associated with fostering an interest in the examined issues of social media usage as a communication platform during crisis, which we hope might improve the quality of crisis management policies.

Keywords: public administration, city, social media, crisis management, COVID-19.

1. INTRODUCTION

Information communication technologies usage in the sphere of public administration is mostly discussed as important challenge of contemporary governance and the execution of public administration functions. Public administration is the key subject of contemporary governance processes. Simultaneously, the role of engaged public is irreplaceable in current democratic states governed by the rule of law. The benefits and threats of information technology implementation must be considered in parallel, weighing their consequences. Various positive, negative and contradictory impacts of information communication technologies and modern forms of communication can be discussed for a long time, but most of them relate to the fact that the role of information technologies is irreplaceable.

The widening access to modern technologies has laid the foundation for a qualitatively new meaning of information spreading by public administration. Simultaneously, the quality of information shared by public administration seems to be more important than in the past. Governments and the organizations of public administration are today disclosing more information than ever before (Porumbescu, 2016). Contemporary interaction between public administration organizations and citizens has been evolving from traditional conversation in the office to conversation on social media platforms, from traditional face-to-face to real-time online conversation or communication (Kowalik, 2021). Put differently, technological changes have opened new dimensions of fundamental aspects of democratic societies. Regarding the growing use of innovative and modern tools, public administration has started to use social media as an alternative and complementary communication platform. In this sense, the use of social media might be characterized as a crosscutting issue of contemporary governance. Public administration uses social media mainly to improve transparency and openness, as well as participation and engagement of citizens. Social media usage is also issue, which is currently discussed in its connection to pandemic situation caused by the COVID-19 disease.

The purpose of this study is to examine the use of social media as an informational platform for crisis management focusing on information shared about the COVID-19 disease by local self-government units in the Slovak Republic. More precisely, the paper is focused on the official Facebook page usage of eight regional cities in the Slovak Republic during 2020. Besides that, the article tries to provide theoretical and practical insight to the use of social media in the sphere of public administration in general and as an important part of crisis management.

The paper consists of three parts. The theoretical introduction regarding the potential of the social media concentrates its attention on the importance of social media and benefits of their usage, which relate to the use of social media by public institutions at all levels of governance. The second part examines selected aspects of social media usage in the conditions of regional cities in Slovakia, primarily informational activities of selected cities in the time of pandemic crisis and the intensity of Facebook usage during first and second wave of the coronavirus pandemic in the conditions of Slovak Republic. Regarding the findings the article ends with a discussion about the perspectives and limits of social media usage in the public administration during the crisis.

2. GROWING IMPORTANCE OF SOCIAL MEDIA IN CONTEMPORARY PUBLIC ADMINISTRATION

The use of information communication technologies in public administration, e-participation and engagement have mostly been discussed in their connections to social media in the last few years. Overall, social media are the phenomenon of last decade. Comparing to traditional websites, social media bring qualitatively different level of interactivity among users and official social media pages are also capable to reach broader public (Silva, Tavares, Silva & Lamairasde, 2019; Bregman 2012). Besides, social media are freely available and public administration organizations don't need to build up expensive technological background. Social media, such as Facebook, Instagram, Twitter or YouTube, are platforms which have potential to connect billions of users and have ability to transform the way people are accessing, reading and spreading the information (Driss, Mellouli. & Trabelsi, 2019). Regarding the importance of social media in public administration the paper focuses on Facebook usage. Facebook is currently the most popular social networking site in the world (Mergel 2013; Shafritz et al. 2017). Public administration uses Facebook as a communication tool which could make communication with the public more effective (Lee & Reed 2015; Lev-On & Steinfeld 2015). Social media and their impacts on society continue to grow, and there is no evidence that this popularity is slowing or stopping (Siena et al. 2019; Toscano 2017).

The importance of social media was identified by governments as a tendency caused by their attractivity among various types of users across society. Users of social media can be distinguished into two groups, one user type with high intensity, platform preference and multiple functionalities usage, and the other user type with low intensity, no platform preference, and fewer functions of social media usage (Shwartz-Asher, Chun, Adam & Snider, 2020). The power of social media to connect people and information in real time is increasing the capacity of people to exercise power and mobilize into action, because many groups can be reached very easily, but on the other hand, they have the potential to split the persons living in one joint household (Miňová 2020; Sihi 2018; Lev-On & Steinfeld 2015; Bourgon 2011). Put differently, the use of social media and information included on social media pages affect merely each sphere of our society, especially patterns of behavior, hierarchy of values and opinions of individuals.

2.1. Impacts of social media on the execution of public administration functions

The importance of social media in public administration could simultaneously be identified in the daily execution of public administration functions. The use of social media is expected to contribute to the fulfilment of goals and imperatives, such as cost saving, quality of public services, citizen satisfaction, transparency, accountability, citizen participation or cooperation.

Regarding the courage of public administration organization to use social media the beginning of this journey is relatively simple. Specific groups of challenges can be identified in public sector, such as systematic challenges, organizational and cultural challenges, informational challenges, technological challenges, and legal challenges (Mergel, 2013). Public organizations could very easily create their official social media pages, but at least the following aspects of social media usage should be considered: social media policy with goals, tools and objectives, staff to make sure that content is up to date, the ability to protect and monitor the site to secure the site is not abused or hijacked (Shark, 2015). However, it is better to have fewer types of social media accounts and better interaction with community members than to engage in more types of social media with minimal interaction (Snead,

2013). The social media usage seems to be very simple and non-problematic. On the other hand, various risks and threats must be managed by the organization and administrators of social media pages. Simultaneously, the specific character of public administration must be considered. In this sense, specific contradictions need to be reconsidered: (1) the open character of social media versus the closeness of public organizations, (2) the self-organizing capacities of social media versus the focus of public administration on strict control, and (3) the horizontal character of social media versus the hierarchic structure in public administration (de Kool, 2014).

Obviously, some important challenges and discrepancies must be solved. Otherwise, the ideal of public administration, cooperating with the smart, digital and informed public through the modern technologies, would not be reached. On the other hand, we must agree with the opinion that citizens as fundamental aspect of information society is directly dependent on cyberspace with its own reality, which is their main arena for gathering of information (Župová, 2019). In this sense, social media represent key part of everyday life of dominant part of individuals in contemporary society of 21st century.

Regarding the need of a systematic approach the use of social media by public administration organizations should be based on a sophisticated strategy. Social media strategies need to be a part of a larger institutional framework for engagement policy that helps democracy work (Laforest, 2013). Besides, the core elements of social media policy include employees' access, account management, acceptable use, employees' conduct, content, security, legal issues, and citizens' conduct (Hrdinová, Helbig & Stollar-Peters, 2010). In this sense, social media activities need to be considered in wider circumstances. Social media strategies must be implemented in accordance with other crosscutting policies in public institutions.

Summing it up, the use of social media represents one of the biggest challenges of contemporary governance processes. On one hand, public administration organizations want to spread information to as many individuals as it is possible. On the other hand, citizens want information about the space and territory they live in as soon as possible. This can help citizens and governments, as partners, to be more informed, make socially responsible decisions and to transform governance system at the city, region or state level (Ručinská & Fečko 2020; Picazo-Vela, Fernandez-Haddad & Luna-Reyes, 2016; Bonsón, Royo & Ratkai, 2015). This interactive dialog is possible thanks to social media because social media helps to transform the role of citizen from a passive adopter to a co-creator of policies (Stamati, Papadopoulos & Anagnostopoulos, 2015). Finally, social media can be perceived as ideal platform to connect public administration organizations and citizens in real-time two-way interaction.

2.2. Social media as important communication platform in the time of crisis

Public administration organizations use social media to reach thousands of people in real-time at various levels of government and studies based on content analysis has increased in last years (Callejo-Gallego & Agudo-Arroyo 2019; Jukić & Svete 2018; Špaček 2018). The use of social media by various types of public institutions is mostly examined in the ordinary situations and mostly general aspects of sharing of information is the center of scholars' attention. However, various existing studies focusing on social media crisis communication has changed thinking about sharing immediate information to public during the crisis (Coombs, 2015). Social media was used during various natural and man-made crisis situations, such as the wildfires in California (Sutton, Palen & Glocka, 2008), the 2010 Haiti earthquake, and Hurricane Sandy (Preston & Stetler, 2012), organizing of civil society protests (Valenzuela, Arriagada & Scherman, 2012; Abdelsalam et. al, 2013), the terrorist attacks in Europe (Smith, Smith & Knighton, 2018).

During the time of disaster or crisis, people try to communicate with their family and friends, while they seek various information about their basic needs, transportation, and enquire safety and security of their lives (Saroj & Pal, 2020). Social media can be perceived as a relatively brand-new platform, which could distribute information in real-time with no delay to almost unlimited number of users. Regarding the various budgetary restrictions and consolidation of public finances, it is imperative to reveal how social media can maximize efficiency in crisis management (Graham, Avery & Park, 2015). Put differently, social media profiles are used by public administration organizations in the time of crisis to

get information to citizens. Besides, social media helps to create virtual space, where individuals feel more informed both by governmental institutions and other individuals, which were caught in the same crisis or disaster situation.

Sharing of actual and relevant information related to crisis can be perceived as important part of the execution of public administration functions, in the opinion of the citizens. During any type of crisis, social media have become a gateway for seeking and sharing information (Liu, Austin, & Jin, 2011). Thanks to interactivity and naturalness of social media, people automatically use them to search actual information in the case of emergency. Simultaneously, public administration organizations must consider the fact that information shared on social media pages during the crisis should be various, because public divided into communities may have different information needs (Zhao, Mengqi & Liu, 2018).

The popularity of social media is evident during more than one decade. Facebook as the most popular social networking site updated his interface and add many functionalities, which help people to organize and communicate during the crisis. Social media can deal with large traffic, stay online and serve as a platform for real-time information exchange and interactive conversation (Saroj & Pal, 2020; Hand & Ching, 2011; Duffy, 2011; Yates & Paquette, 2011). During the time of crisis, people need as many information as it is possible. In this sense, the main benefit of social media is that people are less likely to go to a website for additional information during an emergency, because social media may have more up to date and timely information (Kavanaugh et. al, 2012).

Situation and measures of the governments connected with the COVID-19 pandemic should also be perceived as crisis. Governments, public health organizations and public administration organizations can take the advantage of social media to disseminate epidemic information to the public (Du, Chen, Liu & Zheng, 2021). Social media have become ideal communication channel, which have been used for sharing and seeking real-time information about the COVID-19 pandemic and related actual information (Roy, Moreau, Rousseau, Mercier, Wilson, & Atlani-Duault, 2020).

The use of social media in the time of crisis is very actual and attractive, both from the theoretical and practical point of view. This argument is not based only on the attractiveness and importance of social media usage but is underlined also by the fact that crisis and disasters will occur in our lives sooner or later. In this sense, each of us will occurs in situation, when searching for actual and relevant information about emergency around us could save our lives. According to abovementioned, social media might serve this purpose very satisfactorily.

3. RESEARCH DESIGN AND METHODOLOGY

Regarding the principle of subsidiarity local self-government is the key part of public administration. As it was mentioned many times before, the study concentrates its attention on regional cities in the Slovak Republic. Selected regional cities are mostly perceived as initiators of innovative solutions in Slovakia. Besides, each of the eight selected region cities has a higher population than any other local self-government unit in the Slovak Republic. It must be stated that there are only eight regional cities in Slovakia. Regional cities represent more than one-fifth of the total population of the Slovak Republic. The status of being a regional city is not associated with any special or unique legal position of these cities. According to legal norms, each local self-government unit has the same competences. The main difference between cities and other units is determined by the fact that cities realize key activities focused on the production of public services, both for their own residents and residents from the nearest territory.

The purpose of this study is to examine the use of social media as informational platform for crisis management focusing on information shared about the COVID-19 disease by local self-government units in the Slovak Republic. More precisely, the paper is focused on the official Facebook page usage of eight regional cities in the Slovak Republic during 2020. The hypothesis is based on the statement that selected cities have increased the usage of their official Facebook pages to inform citizens during the COVID-19 pandemic. In this sense, the paper tries to answer these research questions: How often did selected regional cities shared information about the COVID-19 in posts shared on their official

Facebook pages? How were official Facebook profiles used during important and crucial times during COVID-19 pandemic in 2020?

The research sample was selected intentionally. The study analyzes the official Facebook pages of eight regional cities in Slovakia (Banská Bystrica, Bratislava, Košice, Nitra, Prešov, Trenčín, Trnava and Žilina). The selection of cities was determined by the fragmentation of local self-government and the importance of regional cities in Slovakia. Data were collected between 1 January 2020 and 31 December 2020. All data were obtained by analyzing the official Facebook pages of regional cities in Slovakia. The acquired data were processed by using methods of descriptive statistics. Altogether 4,142 posts were analyzed, and all of them were checked manually. Grouping of analyzed posts to the 53 weeks of the year was selected because of clear and concise presentation of data and formulated research questions.

In the paper, content analysis was used to analyze posts published on selected official Facebook pages. Content analysis was selected because of its potential to convert qualitative data, published on official Facebook pages, into quantitative data. Abstraction was used in the context of filtering those aspects of published information, which were relevant for our research, mainly information connected with COVID-19 crisis. The attention was mainly directed to posts including information about COVID-19 disease. A synthesis was used to draw conclusions resulting from the analysis.

4. RESULTS AND DISCUSSION

The paper focuses on the character of information published between 1 January 2020 and 31 December 2020, mainly how Slovak regional cities have used their official Facebook pages to inform citizens about the COVID-19 pandemic crisis. Based on the methodology, the analysis was dedicated to general aspects of posts including COVID-19 theme, as well as the analysis of activity of selected local self-government units during important and crucial periods of 2020 in the conditions of the Slovak Republic.

4.1. Results

The research revealed that information about the COVID-19 were important part of the content, which was published by the selected group of cities in the Slovak Republic during the examined period. Selected general aspects of posts connected with the COVID-19 were analysed, mainly first shared posts and share of posts with COVID-19 theme on total number of posts published during the analysed year.

The first posts with information about the COVID-19 were published by the City of Bratislava on March 2, the City of Prešov on March 3, the City of Nitra and the City of Trnava on March 4, the City of Banská Bystrica and the City of Košice on March 5, the City of Trenčín on March 8, and the City of Žilina on March 10. The first confirmed positive case of COVID-19 disease was on 6 March in a patient in Bratislava with negative traveling anamnesis. The official Facebook pages of the selected regional cities have paid attention on keeping their citizens informed about possible threats. In this sense, some cities inform their citizens few days before first positive case in the Slovak Republic.

The key part of our analysis was focused on occurrence rate of posts, which included information about the COVID-19 disease. Naturally, there were no posts, which refers to the COVID-19 in the first two months of the year. On one hand, January and February was the period when there were first positive cases in other European countries, but there was no positive case in the Slovak Republic. On the other hand, Slovak cities did not pay serious attention on this dramatically changing situation. The in-depth analysis we performed of information included in posts allows us to identify, which posts include statement about the COVID-19. This was very important in accordance with identification of posts with the COVID-19 theme. Regarding the formulated research questions, it was necessary to find out distribution of these posts during the examined period. In this sense, the posts focused on the COVID-19 theme must be specified.

According to obtained data, the posts focusing on informing citizens about certain information about the COVID-19 represent 16,51% out of all posts of selected cities (684 posts) during examined period. Comparing this finding with other spheres of social life, the COVID-19 information was relatively as just popular as information about sport, developing of public infrastructure or public safety issues.

Important part of our analysis was distribution of these identified posts to 53 weeks in the year. This step helps us to identify weeks, which could be characterised by intensive use of social media pages. The use of official Facebook pages of selected regional cities is presented in the graph 1.

Graph 1: Number of posts published on official Facebook profiles of regional cities in the Slovak Republic

Source: Author

Based on our research, the highest occurrence rate of COVID-19 posts was identified in the 44th week of the 2020. Selected eight cities published 28 total posts in average every day during this week. Simultaneously, 80% of these posts include statement about the COVID-19. Such high value of posts published for one week was not identified in any other week of the year. The second highest number of posts published was identified in the 12th week of the year (18,43 posts per day). Similar high average value of posts published in every day of the week was identified in the 11th week (17,29 posts per day) and in the 13th week (17,00 posts per day). During these three weeks, the highest number of number of posts including COVID-19 information was published (13,71 posts per day in the 12th week, 12,86 posts per day in the 11th week and 6,43 posts per day in the 13th week). It must be stated that during the 11th and the 12th week of the year 2020, the share of posts, which include information about the COVID-19 represent 74% out of all posts published by selected regional cities. These four weeks represent period of year, when analyzed cities have used maximum potential of their official Facebook pages to inform citizens about actual pandemic situation and relevant restrictions of the Government of the Slovak Republic.

However, selected regional cities have informed their citizens about the COVID-19 pandemic all year long. On the other hand, it must be stated that especially during the summer months 5 posts, which included information about the COVID-19 was identified as maximum posts published per one week. The occurrence rate of the COVID-19 posts was also high in the next periods of the 2020. Simultaneously, there were also identified weeks, when posts including the COVID-19 theme was important part of overall posts published by regional cities, namely the 45th week with 56%, the 14th week with 44%, the 10th and the 17th week with 33%, the 15th week with 30% and the 43rd and the 53rd week with 22% of COVID-19 posts published for one week.

Summing it up, initiatives of selected regional cities connected with the ambition to inform citizens about the COVID-19 pandemic have generated higher number of total posts published in the 2020. This statement is confirmed especially in the 44th and the 12th week of the year 2020.

4.2. Discussion

Based on abovementioned, social media represent platform, which main benefit is to share actual and relevant information between public administration and citizens in real-time. In this sense, our attention was put on two important periods, which were important in the Slovak Republic in the case of the

COVID-19 pandemic and related measures of the Government of the Slovak Republic. The centre of our attention is the beginning of the March and the first strict lockdown, as well as the mass testing of Slovak citizens at the end of the October and beginning of the November. These important periods in 2020 are mostly characterized as first and second wave of coronavirus in the conditions of the Slovak Republic.

Increased activities of selected regional cities in mentioned days of 2020 can prove assumption, that local self-government units use social media as important communication platform for crisis management. On the March 10, the Central Crisis Staff of the Slovak Republic banned the organization of sporting, cultural and public events for 14 days and ordered a mandatory 14-day quarantine for all citizens returning from the most affected countries. Various measures have come into force during this 11th week of the year 2020. Based on data obtained, in the next week (the 12th week of the year) selected cities have used very intensively their official Facebook pages to inform citizens about general issues, but mainly about current crisis caused by new Covid-19 disease and measures adopted by the Government of the Slovak Republic. Besides another three weeks of the year can be characterized with high share of COVID-19 posts on total posts published. The occurrence rates of posts including information about the COVID-19 and measures of government vary between 30%-44% between the 13th and the 15th week.

However, the highest share of COVID-19 posts was identified in the 44th week of the year. The reason is very simple. The last 6 days of October and first day of November were mainly connected with the COVID-19 topic, because the mass testing was realized in the Slovak Republic between 31st October and 1st November. This mass testing was realized by financial and material sources, which were coordinated by the Government of the Slovak Republic but based on principle of subsidiarity mainly organized by local self-government units. In this sense, local self-government units were informing they citizens in real-time on daily basis.

We might argue that based on analysis of obtained data, selected eight regional cities have used their official Facebook profiles to manage their citizens during the COVID-19 pandemic. This statement is also confirmed by the fact that intensive activity connected with sharing of posts were identified mainly during selected periods of time in the conditions of Slovak Republic (the first wave of coronavirus and the mas testing of citizens). In this sense, official Facebook profiles can be perceived as important part of informational activities of cities' offices and sharing information during time of crisis, the COVID-19 pandemic crisis in our case.

4.3. Limits of the study and future research

The use of Facebook by public administration organizations still represents a relatively unexplored field of study, and possible negative aspects have not been examined so far. The question of legitimacy is raised automatically when we talk about these new platforms. In this sense, it should always be taken into consideration that potential recipient of key message might miss information, which is relevant and significant for him/her in the time of crisis. Social media need to be perceived as complementary communication channel. However, there is no doubt that the importance of social media will rise in the coming years. The research sample was selected intentionally, and the paper examines the official Facebook pages of eight regional cities. According to this fact, the widening number of organizations could be very useful both for theory and practice.

The paper could foster future research. In this sense, the paper tried to support an interest in deeper research both in local self-government and public administration in general. The benefit of the paper might be a comprehensive view, thanks to which local self-government units could implement better social media policies in the sphere of crisis management. Moreover, the paper concentrates its attention to Slovakian cities, but findings could be inspirational for public administration organizations around the world. In this sense, the international comparison seems to be very attractive. Simultaneously, it might be interesting to examine how public administration use social media during different waves of coronavirus. Comparison of social media usage during Covid-19 crisis and other types of crisis could also be very useful.

5. CONCLUSION

The use of social media in the time of crisis is very actual and attractive, both for the theory and practice. This argument is not based only on the attractiveness and importance of social media usage but is underlined also by the fact that crisis and disasters will occur in our lives sooner or later. In this sense, people are seeking information during an emergency, because social media may have more up to date and real-time information than other communication platforms. The importance of social media usage in public administration during the crisis and disaster has been confirmed not only by theoretical discussion, but it has also been proven by our research. The research revealed that information about the COVID-19 were important part of the content, which was published by the selected group of cities in the Slovak Republic during the examined period.

The hypothesis has been proven. We might argue that based on analysis of obtained data, the selected group of Slovak regional cities have used their official Facebook pages to inform and to manage their citizens during the COVID-19 pandemic. This statement is also confirmed by the increased activity connected with sharing of posts during key periods of time in the conditions of Slovak Republic, mainly the first wave of coronavirus in March and the mass testing of citizens at the end of October and the beginning of November. In this sense, official Facebook profiles can be perceived as important part of informational activities of cities' offices and sharing information during time of crisis, the COVID-19 pandemic crisis in our case.

Summing it up, the benefit of the article is also associated with fostering an interest in the examined issues of social media usage as a communication platform during crisis, which we hope might improve the quality of crisis management policies.

The organizational factors that impact on public sector's digital transformation and on the creation of social (public) value

Dr. Panagiota Xanthopoulou¹

¹ Visiting Researcher, Department of Political Science and International Relations, University of Peloponnese/ Phd (cand.) at Department of Management Science and Technology, University of West Macedonia, p.xanthopoulou@uop.gr / pattyxanth@gmail.com , ORCID: <https://orcid.org/0000-0003-2503-3901>

Abstract: The aim of the study is to investigate the internal factors that affect the results and the degree of adoption of the digital transformation, the processes and the effective governance of the public sector. More specifically, we examined how digitalization impacts on the way in which the public sector in Greece organizes, produces and provides its services, identifies key success factors related to digital transformation projects and sets out a proposed framework for quality citizen service projects, creating thus a social value (value based approach). An interdisciplinary approach and comparison has been applied among selected European Union countries in the areas where digital governance has been applied to public-to-citizen transactions, with an emphasis on the current pandemic crisis (examples include polling, biometric identification and personal identification). In addition, a quantitative survey was conducted by distributing online questionnaires to middle and senior executives of public organizations in Greece. A total of 151 questionnaires were answered and their analysis was performed using the statistical tool of SPSS. The results showed that the internal factors that influence the degree of adoption of digital governance and its successful implementation within the public organization include the technological factors that compose the quality of service and the organizational factors (training and evaluation of human resources, leadership, organizational strategy, and the creation of a digital culture). The originality and contribution of the current research lie in the fact that there is little systematic empirical evidence on how public administrations currently define digital transformation in their day-to-day practices, with the majority of research using only qualitative research methods and focusing on mainly technological components. Our results can be useful for policy makers considering the implementation of similar systems in their public administration practices.

Keywords: Digitalization, Digital Transformation, Public Sector, Organizational Factors.

1. INTRODUCTION

Implementing organizational changes is a difficult task, because although important steps have been taken towards their effective management, change programs continue to show high failure rates. Therefore, more research suggests a focus on the typical features of a successful public and private sector change program, which indicates that there is still a need for conceptual research of the field. We could also verify that most of the empirical research on digital governance and digital transformation of the public sector was qualitative using case studies, which cannot lead to generalization prospects, only to theoretical ones, and therefore it would be useful to invest in quantitative research methods in order to allow the results to be generalized. Consequently, there is also a great lack of mixed studies and, therefore, it would be more valuable to draw more attention to this. Mixed studies allow researchers or a team of researchers to combine elements of qualitative and quantitative research approaches for a broader purpose of breadth and depth of understanding and confirmation according to Schoonenboom & Johnson (2017).

Digital transformation in the public sector means new ways of working with stakeholders, creating new service delivery frameworks and new forms of relationships (European Commission, 2013). However, there is little systematic empirical evidence on how public administrations currently define digital transformation in their day-to-day practices, how they approach digital transformation projects, and what the expected results are (Eggers & Bellman, 2015). In fact, terms such as digitization, digitalization, digital governance or digital transformation are used interchangeably in the literature. Second, executives need to create a climate of empowerment and continuous improvement of digital skills and, finally, align all employees with a common vision around digital transformation. It is important for leaders to understand the digital transformation and to show a willingness to take these changes into account. Leadership seems to have a direct impact on digital maturity itself (Danailova, 2014;

Xanthopoulou and Karampelas, 2020). Ensuring success in the digitization of the public sector requires strong central leadership complemented by preventive local and regional initiatives promoted by local actors (Millard, 2010). Digital technologies alone provide little value to an organization (Kane et al., 2015). It is their use in a specific context that enables a company or organization to discover new ways of creating value, according to the enduring idea that organizational change is an emerging phenomenon (Markus and Robey, 1988). The literature emphasizes change as well as redefining business models (Osterwalder and Pigneur, 2010) in the context of digital transformation (e.g. Morakanyane et al., Piccinini et al., 2015b). The success of e-governance and digital governance systems also depends significantly on how citizens perceive the value achieved by using these systems (Scott et al., 2016).

The present study aims to investigate those factors that affect the results and the successful adoption of the digital transformation. More specifically, it examines the key success factors associated with digital transformation projects and sets out a proposed framework for creating social value to the society. Our results can be useful for policymakers considering the implementation of similar systems in their public administration and management decisions. The digital transformation in the form of substantially new organizational practices, skills and models has become the key theme in modern public administrations and management processes. However, despite growing need for digital transformation in the public sector, current research has rarely focused on adopting specific technologies (from social media to block chain) and processes (from digitized transactions to flexible contracts). As a result, we still know relatively little about whether and how the adoption of digital technologies is associated with real transformations of entire public sector organizations, with the emergence of new public administration and policy practices, and, ultimately, with new public sector reforms. The idea of the study is to contribute to ongoing academic discussions by providing new theoretical knowledge and empirical evidence on the effects of internal organizational factors on the digital transformation of public sector organizations.

2. LITERATURE REVIEW

2.1. Digitalization and digital transformation

Arnold and Wade, (2015) describe digitalization as something "paperless" and as the application of the digital tools to all aspects of society. Jurisic & Kermek (2011) observe that almost all sectors are affected by digitalization. First, it is important to make a first distinction between the terms "digitization" and "digitalization" which are used as synonyms. The "digitization" refers to the conversion of information from something analog to a digital one (Picard, 2011) or to the automation of processes through information communication technologies (Hess et al., 2016) (for example, scanning a document or typing handwritten notes in an excel file). On the other hand, as Imgrund et al. (2018) state, "digitalization" means significant improvements in the use of information technology by organizations, the implementation of information technology strategies and information processing capabilities. Thus, we can understand that if digitization refers to the conversion of data and processes, digitalization refers to a transformation and embraces the ability of digital technology to collect data, establish trends and make better business decisions. The same conclusion comes from Gartner Group (2016) for which digitalization involves the use of digital technologies to change business models, provide new revenue and value creation opportunities. Similarly, according to Legner et al. (2017), digitalization is understood as the socio-technical process of adaptation of new digital technologies, or a process of adaptation of digital technologies that occur at the individual, organizational, social and global level.

In relation to e-government, digitalization involves the transformation of traditional, bureaucratic and "paper-based" processes into digital platforms (Janssen & Estevez, 2013). In this context, digitalization is seen as the advanced form of e-government innovation that redesigns natural processes to promote efficiency and effectiveness (Irani et al., 2008; Weerakkody et al., 2011). It contributes to the promotion of democracy, transparency, accountability and freedom (Falk et al., 2017) and it also offers opportunities for governments to modernize public administration and cooperation with citizens and businesses (Falk et al., 2017). One form of public sector modernization is the simplification of

procedures through the standardization of activities to increase efficiency and reduce response time (Calvo & Campos, 2017). At the same time, digitalization leads to cost savings in public administration (Falk et al., 2017; Davison et al., 2005; Grönlund & Horan, 2004; Venkatesh et al., 2012). In general, digitalization helps to streamline costly and inefficient vertical and horizontal processes (Janowski, 2015; Janssen & Estevez, 2013; Sun et al., 2020).

Digital governance according to Luciano et al. (2018) is the way that governments use ICT to provide information and government services to citizens, to improve the quality of ICT services and to provide greater opportunities for citizen participation. It includes a new leadership style and a new way of making public policy and investment decisions (Kalsi & Kiran, 2015). Thus, digital governance has evolved as a governance model that enhances the potential of the public sector to use appropriate technologies for improving governance relations - both internal and external - at various levels of government. Its objectives are to promote democracy, the right to expression and human dignity, to support economic development and to encourage the effective and efficient provision of services to society (Saxena, 2005). Digital governance refers to the use of ICT to create public value through the cooperation of society and the provision of appropriate information and citizen participation (Kalsi & Kiran, 2015; Dawes, 2008).

In conclusion, e-government focuses on the administration and management within an organization, public or private, and it refers to the internal use of ICT (especially the Internet) for horizontal and multilevel management of organizational resources, policy and process management. Digital governance, on the other hand, can be described as a stage of e-government maturity and refers to the digital transformation required for a collaborative government / administration model, more citizen-centered that creates social, public value (Xanthopoulou, 2020). Figure 1 shows the transition from the traditional bureaucratic public administration to the creation of social value.

Figure 1: From traditional public administration to the creation of public value

2.2. Factors influencing the success of digitization projects

Public sector digital projects are integrated into combinations of policy reforms and organizational changes designed to establish, support, and promote transformation in public organizations (Cordella and Iannacci, 2010). In general, the nature of culture and structures / organization in the public sector can be barriers to digital innovation (Heeks & Stanforth, 2007; Irani et al., 2007; Weerakkody et al., 2011). The traditional public sector in mainly western countries is characterized by hierarchical and dissimilar structures, as well as bureaucracy and procedures based on print media (Davison et al., 2005; West, 2004) that cause deficiencies and delays (Beynon-Davies, 2007). Initially, the bureaucracy with its literal interpretation (office administration) in the public sector was initially aimed at promoting efficiency, equality and democracy (Cordella & Iannacci, 2010). Today, however, it has become a source of multiplier and recurring delays and inefficiencies (Davison et al., 2005; Wiredu, 2012). Other problems arising from the structure and culture of the public sector include functional divisions and politics (Beynon-Davies, 2007; Irani et al., 2007) as well as resistance to innovation (Seng et al., 2010; Zhao & Khan, 2013). The lack of exchange of information between departments and organizations also poses

challenges to digitalization (Davison et al., 2005). Resistance by civil servants for fear of job loss (Falk et al., 2017) also limits digitalization in the public sector. Barriers identified by international research include complex and multi-layered bureaucratic structures inherited from previous forms and schools of administration (Imran, 2013), e-literacy and inadequate ICT infrastructure (Bertot et al., 2010; Heeks & Stanforth, 2007; Hendrix, 2013). Other challenges include resistance to change, power struggles and lack of cooperation between organizations (Schuppan, 2009), as well as failure to update existing laws (Basu, 2004).

Many studies have conceptually and empirically examined the challenges and barriers to the adoption of technology in public administrations. According to Fountain (2004), how a technology is applied depends on the institutional and organizational arrangements that guide decision makers in their day-to-day behaviors. The model of Fountain (2004) is commonly used to describe the interactions between organizational forms and institutional arrangements and their implications for the design of a technological system (Cordella & Iannacci, 2010; Luna-Reyes & Gil-Garcia, 2014). Both factors - organizational forms and institutional arrangements - may hinder the adoption of new technologies in the public sector. For example, Salvoldelli et al (2014) showed that institutional arrangements have prevented the adoption of e-government solutions in the European Union. Conradie and Choenni (2014) showed similar results for open data in the Netherlands on organizational factors. Thus, the acceptance of technologies depends to a large extent on their compatibility with existing institutional and organizational arrangements. Empirical analyzes of barriers to the application of ICT in the public sector have focused mainly on e-government - from a technological point of view, a previous public sector innovation. Numerous empirical studies have found barriers to the adoption of e-government, including a lack of trust (Gilbert et al., 2004), general concerns about public safety, privacy and data protection (Schwester, 2009; Wing, 2005; Zakareya & Zahir, 2005), information quality (Gilbert et al., 2004), strategy (Wing, 2005; Zakareya & Zahir, 2005), technology (Schwester, 2009; Lam, 2005; Zakareya & Zahir, 2005), policy (Lam, 2005), leadership and management (Kim et al., 2009; Schedler & Schmidt, 2004; Schwester, 2009), accessibility (Becker, 2004; Gilbert et al., 2004) and organizational weaknesses (Chen & Gant, 2001; Schwester, 2009; Lam, 2005; Zakareya & Zahir, 2005). In their meta-analysis, Savoldelli et al. (2014) identified three groups of barriers to the adoption of e-government: technological and economic, managerial and organizational, and institutional and political. Technological factors cited in the literature as barriers to these transformation efforts include system complexity and incompatibility (Gil-Garcia et al., 2007) as well as lack of business architecture (Janssen and van Veenstra, 2005; Kamal et al., 2009), standards and interoperable systems (Ebrahim and Irani, 2005). In addition, security threats are identified as barriers (Ebrahim and Irani, 2005).

3. METHODS

In the present research it was chosen to distribute questionnaires to middle and senior executives of public organizations, so to conduct a quantitative survey, to executives of public organizations that use these digital services in Greece in order to evaluate the effectiveness and efficiency of this digital project (value based approach) and mainly to reveal the internal organizational factors that affect them. The analysis of the quantitative data derived from the questionnaires was carried out using statistics (SPSS) with the aim of better organizing and recording them. In order to measure the components that influence the success of digital adoption by public organizations, we used a 39-item questionnaire, a research tool that had previously been tested and validated in other studies (e.g. Abhichandani et al., 2005; Morgeson et al., 2011; Park and Blenkinsopp, 2011; Parasuraman et al., 1988; Mahmood, 2018; Al Hujran, Aloudat & Altarawneh, 2013). In total, 151 questionnaires were answered and as mentioned, the participants were middle and senior executives in public organizations, during the lockdown period from October 2020 to March 2021. This sample allows us to proceed with reasonable and reliable statistical analyzes and to draw valid conclusions. In addition, the validity of the questionnaire is ensured by the synthesis of questions of already published questionnaires in international surveys but also by the use of the findings of the literature. We examined the relationships between these components: Service Quality, Information Quality, and Perceived Impact on the organization and the dependent variable that is the Degree of Adoption (DA) of digital governance in a public organization with SOAL. Component analysis is used to reduce the number of variables to fewer component numbers, with three

ultimately retained (Service Quality (SQ), the second is Information Quality (IQ) and the last is the Perceived Impact (PI) on the organization). The Cronbach Alpha reliability test was used to measure the reliability of each component. The data were analyzed using the multiple regression routine of SPSS software version 24.

3.1. Results and findings

The total sample of the study consisted of N = 151 respondents, 109 (72.2%) were women and 42 (27.8%) were men. The structure of the observed correlations was determined from Table 1 of the component analysis method, identifying the groups of variables that have a high correlation. As shown in Table 1 below, the first component is Service Quality (SQ), the second is Information Quality (IQ) and the last is the Perceived Impact (PI) on the organization. Table 2 with KMO and Bartlett's Test shows that the data from the sample were adequate for the components analysis (KMO = 0,803 > 0,60, Bartlett's Test significance <0,001) (Yong, 2013; Kinnear and Gray, 2011).

Table 1: Rotated Component Matrix^a

Rotated Component Matrix ^a			
	Component		
	1	2	3
SQV2	0,71	0,00	0,00
SQV3	0,59	0,00	0,00
SQV6	0,66	0,00	0,00
SQV7	0,69	0,00	0,00
SQV8	0,66	0,00	0,00
SQV9	0,68	0,00	0,00
IQV10	0,00	0,73	0,00
IQV11	0,00	0,75	0,00

Table 2: KMO and Bartlett's Test

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin		0,83
Bartlett's Test of Sphericity	Approx. Chi-Square	614,754
	df	91,00
	Sig.	0,00

Subsequently we ran a reliability test Cronbach's alpha interpreted for the questions of each component. The results showed that the alpha coefficient for the first component (Service Quality- SQ) is 0.79, for the second (Information Quality-IQ) is 0.62, and for the third (Perceived Impact-PI) is 0.77. In most cases a reliability factor of 0.7 or higher is acceptable in social science research. The alpha coefficient for the second component (Quality Information) is 0.62 <0.7 which means that the data do not have high internal consistency (Kinnear and Gray, 201; Baglin, 2014).

Table 3: Cronbach's Alpha

SQ		IQ		PI	
Cronbach's Alpha	N of Items	Cronbach's Alpha	N of Items	Cronbach's Alpha	N of Items
0,79	6,00	0,62	3,00	0,77	5,00

Table 4: Statistics

Statistics					
		SQ	IQ	PI	DA
N	Valid	151,00	151,00	151,00	151,00
	Missing	0,00	0,00	0,00	0,00
Mean		3,79	3,66	4,43	3,37
Median		3,83	3,67	4,60	4,00
Std. Deviation		0,54	0,57	0,51	1,05
Variance		0,29	0,32	0,26	1,11
Skewness		-1,23	-0,05	-1,02	-0,69
Kurtosis		3,63	1,18	1,36	-0,11
Std. Error of Kurtosis		0,39	0,39	0,39	0,39

The overall regression model was significant, the value of R² is greater than zero (0,125). Table 5 shows the predictive power of the independent variables, in terms of the degree of adoption (DA) of digital governance in organizations. The value of R² is 0.125 which shows that the independent variables (Perceived Impact-PI, Information Quality-IQ and Service Quality-SQ) explain 12.5% of the variance of the dependent variable.

Table 5: Model Summary^b

Model Summary ^b					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	,353 ^a	0,125	0,107	0,996	1,901
a. Predictors: (Constant), PI, IQ, SQ					
b. Dependent Variable: DA					

Table 6: ANOVA^a

	Total	166,73	150,00			
a. Dependent Variable: DA						
b. Predictors: (Constant), PI, IQ, SQ						

Table 7 shows the predictive ability of the three components, concerning the degree of adoption of digital governance. Quality of service (SQ), quality of information (IQ) and perceived impact (PI) are positively related to the adoption of digital governance in an organization. Service quality, information quality and perceived impact have a statistically significant effect on the outcome variable (p value <0,05) (Yong and Pearce, 2013).

	PI	0,23	0,18	0,11	1,30	0,19

a. Dependent Variable: DA

The results presented above provide support for the findings of existing research and literature. The quality of services has a significant impact on the adoption of digital governance in a public organization and refers to concepts such as perceived ease of use, i.e. the degree to which the structure of the e-service portal is clear and easy for the user to navigate and is good aligned with the needs of individual users, it also addresses issues of availability and accessibility of the online service at any time and to the extent that the online service portal performs the service successfully at the request of citizens, operates quickly and facilitates everyday life and the online transactions of the users of the service with other companies / organizations. Next, the quality of information also has an important relationship with the adoption of digital governance in a public organization. It refers to concepts found in international literature such as "trust and security" (for example, obtaining the username and password on the portal, transaction security in the online service, the availability of a data recovery plan, reliability and sequence of the GDPR, the privacy policy so that users have easy access to the respective service while browsing the site, the use of the site of digital signatures for the authentication of users, the monitoring of citizens' activity). In terms of content, an important role is played by monitoring the activity of citizens, the updating and accuracy of information displayed on the online services portal and finally the provision of web applications for a range of services (requests, payments, etc.). Finally, the perceived impact on the organization also has a significant positive relationship with the adoption of digital governance in a public organization. In this component, important parameters related to the Equipment / Resources, the Policy / Strategy followed by the public organization as well as the Organizational culture and Leadership were examined.

4. CONCLUSION

In fact, terms such as digitization, digitalization, digital governance, or digital transformation are used interchangeably in the literature. In addition, we found that the majority of them focus almost exclusively on the technological factors or, if reference is also made to organizational ones, the studies concerning the public sector are few in number. Through the research of these factors in the literature, a questionnaire was created whose axes initially corresponded to four components (Quality of service, Quality of information, Perceived Impact on the organization, Other - external factors). The results of the study showed that out of the four components, only three were statistically significant for the adoption of digital governance and in particular the importance of the first three was found. The answers demonstrated the importance of both the technological factors that compose the quality of service (Perceived ease of use, Promotion of digital governance and Perceived usefulness), the quality of information (Trust and security, Content) and the perceived utility in the organization (Equipment, Policy / Strategy, Organizational Culture and Leadership) as well as organizational factors, emphasizing the importance of training and evaluation of human resources in the successful adoption of digitalization but also the impact of leadership and top management in creating a digital culture within the organization. In the context of the adoption of digital governance, the support of top management plays an important role, because the adoption of new technologies may include new regulatory requirements, a high degree of complexity, new resources, resource integration, redesign and the development of new skills and competencies.

In general, the present study confirms the findings of the literature that the barriers and conditions for a successful transformation of digital government are not limited to technological issues. Many cases that arise suggest that the introduction and adoption of new technologies by governments is often hampered by organizational, institutional, and legal issues. This is often explained by the fact that new technologies are expected to challenge almost every process, system and structure of government. However, these changes are complex and require radical transformations. The aspect of transformation is often seen in the literature as the ultimate goal of the development of digital governance and implies the transition from the digitization of public services to a wider government reforms. In order to sustain this transformation, there must be multiple processes of change and redesign, not only of the organizational processes involved, but also of regulatory and institutional aspects.

Abstract: The most effective way to manage the personnel of an organization is to maximize its performance. This is the basis on which Human Resources Management was built. An increase in staff efficiency means an increase in companies revenues. But are there grounds for applying it to Law Enforcement Agencies and specifically to Hellenic Coastguard? Maximizing the performance of personnel in law enforcement agencies through the implementation of Human Resources Management may differ in terms of the result of private organizations which focus on maximizing their profits. However, the increase of law enforcement efficiency offers a very significant benefit to the state with enormous economic, social, and political implications. The contribution of Law Enforcement Agencies to the social, economic and, political stability of the country, takes place through the fight against crime and the best possible border surveillance/management of the migration phenomenon. Particular importance is placed to the above-mentioned balance of the state and the role of the Hellenic Coastguard with its additional competence in the research and rescue of people at sea and the protection of the marine environment. Maximizing the efficiency of the staff is an essential condition for achieving these objectives. The technique of the research was based on purposive sampling. Twenty structured interviews of Coastguard officers were conducted, taking into consideration as the basic selection criteria their position (intermediate ranking officers who are commanded by senior hierarchical officers and at the same time command lower hierarchical officers). According to the research results, the application of Human Resources Management plays a determining role in the performance of employees. The sample underlined that labor relations, human resources planning, training, selection, job analysis, and performance evaluation are considered the most important functions of maximizing the performance of the employees. In contrast, the working environment conditions or compensations play a less important role in officials performance and this fact proves that simply by implementing a specific management method, without imposing any financial burden on additional salaries or facilities, it is possible to maximize the performance of an organization like Law Enforcement Agencies which offer multiple benefits at a collective level.

Keywords: Human Resources Management, Performance Factors, Law enforcements, Hellenic Coastguard.

1. INTRODUCTION

The tendency of enterprises and organizations to adopt a contemporary management of their employees based more on human factors defined the meaning of Human Resources Management. The creation of this kind of human-centered management took place in order to increase the performance of employees by providing incentives and secure the so-called “competitive advantage” on the market (Dessler 2017). Maximizing the performance is the basis on which Human Resources Management is built. To support this basis, a key structural tool of this management is the emphasis on the way of handling its functions, which includes the human resources programming/planning, the job analysis, the recruitment, the selection, the training-development, the performance evaluation, the compensation, the health-safety working environment and the industrial relations of the employees. Those functions are also classified into four main categories: Staffing (planning, job analysis, recruitment, selection) Training & Development (training, development, performance management-evaluation), Compensation/ Motivation, and Maintenance (industrial relations, working environment) (Decenzo 2015).

2. HUMAN RESOURCE MANAGEMENT & PERSONNEL MANAGEMENT

Human Resources Management and Personnel Management are not two opposing concepts, but the first is a development of the second. The new philosophy in the management of workers reflects the difference between these two conditions. The use of the term “Human Resources” as opposed to

“Personnel” underlines the new Human Resources Management policy, which focuses on the human factor intending to align its will and ability to achieve the objectives of the organization (Hitiris 2018).

The separation of these two concepts, apart from how they are administered, is also noted in the time-scale of staff utilization. Personnel Management, manages personnel in a short-term perspective in the sense of cost, while Human Resources Management treats staff in the sense of asset for the enterprise (resources) in which invests over a long period. (Xirotiri-Koufidou 2010).

In functional procedures, Personnel Management is more closely linked to the concept of simple administration of staff. Its role appears to be purely bureaucratic; it manages staff matters relating to recruitment, dismissals, payments, and safety, showing a face more isolated. The person in charge of the Personnel Management shall hold the post of an administrator of the Agency's functional matters and shall hold the post of a simple transmitter of requests and messages between employees and employers-administration. Fear, insecurity, and the risk of dismissal are widespread in the working environment, and management is treated with caution and introspection, afraid of any negative reaction. Through the impersonal management policy with the short-term treatment of workers, the staff is restricted to individual work, deviating from any personal identification with the objectives of the organization.

On the other hand, Human Resources Management treats the personnel with long-term prospects, by estimated it as resources and capital of the enterprise and through a humane administrative character is interested in its training and development, adopting a policy of dialogue and counseling. In addition to the management activities of staff recruitment, dismissal, and payments, Human Resources Management shall give its attention to all activities that have been progressively developed in recent years, including communication relations between employees and administration, personnel evaluation, education-development and the provision of all the necessary conditions (working environment, safety, health services, etc.) which will lead to the maximum job performance of the employees.

High competitiveness and the desirability of maximizing the profits of private companies have been the main reason that today we are using the concept of Human Resources Management. Over the years, the management of the personnel, being assigned an insignificant role of supervision and mediation between senior management and its subordinate hierarchies, was led to an attempt to maximize the efficiency of workers which would maximize the profits of an organization through a management policy based more on the control and management of the performance of each employee (Torrington Hall, 2014).

The Human Resources Management essentially points out its difference from the Personnel Management through the qualitative elements it adds to its functional procedures (Papalexandris and Burandas 2016).

Table 1: Human Resources Management and Personnel Management

Human Resources Management	
Personnel Management-Functions	Qualitative Elements
HR planning	Leadership Philosophy
Job Analysis	Leadership Development
Compensation	Organizational Learning
Recruitment & Selection	Management of Knowledge
Performance Management	Organizational and Management Development
Training & Development	Group Cooperation & Willingness for Performance
Health & Safety	Organizational Culture-Working Environment
Labor Relations	Internal Communication

Note: Adapted from Papalexandris, N., & Burandas. D., 2003, Human Resources Management, Athens

The basic functions of the Personnel Management, which are the backbone of the Human Resources Command and have prevailed in international literature, are as follows (Armstrong 2006, Dessler 2017, Malik 2018, Mondy & Martocchio 2016):

- **Human Resource Planning:** Its main aim is to identify the needs of an organization and to process and prepare the recruitment of human resources both qualitatively and quantitatively, which will ensure the achievement of the objectives of the enterprise. To realize this, human resource planning should start with the evaluation of staff availability and, as a second step, need to strengthen the weaknesses and cover the needs.
- **Job Analysis:** The job analysis is essentially divided into the description of the job position of the personnel and the Job specification. The job description shall specify the tasks, competencies, responsibilities, the object of employment implied by this position, and even its spatial description. The job specification shall refer to the existence of a list containing the minimum required skills, knowledge, abilities, skills, and even personality traits (e.g. confidentiality, ethics, etc.) required to meet the obligations in this position.
- **Recruitment-Selection of staff:** Recruiting staff is defined as the function of the Human Resources Management which "invites" and identifies the appropriate staff to cover job vacancies. Personnel may be recruited either internally (filling positions due to promotion etc) or externally. The selection of staff shall then take place which includes the process of evaluating and exploiting candidates with the information they are entitled to and selecting them to cover specific jobs.
- **Training and Development of staff:** Staff training refers to the function of the Human Resources Management, which undertakes a process of learning and training personnel for the immediate improvement of performance and technical skills in their work. It has a self-centered character and aims at the personal development of the employee by covering specific weaknesses or enhancing his skills which will have immediate effects on his current work. Accordingly, development refers to a process of learning and training staff to improve their long-term performance and skills in their work. It has a more general humane character and aims to develop capacities that will have an impact on its future work.
- **Evaluation of performance:** Evaluation of staff performance, concerns an assessment of the performance of the work and the services provided by the personnel and its contribution to the achievement of the objectives of the organization. As a process, the performance assessment shall take into account the characteristics, skills of the worker and shall be evaluated by assessing their efficiency to increase performance and improve their weaknesses.
- **Compensation of personnel:** They are divided into direct and indirect. Direct economic remuneration shall consist of wages and salaries, additional overtime remuneration, productivity allowances, profit participation, etc. Indirect economic rewards include medical care, life insurance, social security, vacation, holiday allowances, provision of material resources, food, education, etc. Payments may also not be economic but may have a personal-internal form of reward such as improving the social position, developing interpersonal relations, providing opportunities for development, etc.
- **Health and Safety of personnel:** Health of personnel is defined as the prevention and protection of employees from situations that may harm physical, mental, and emotional health in its morbid form, while the safety of employees is defined by their protection in cases of injuries at their workplace. In addition to the safe working conditions to be offered by an organization to its staff (adequate facilities, equipment, use of safety tools - work equipment, adequate lighting, ventilation, etc.), it is also called to provide appropriate conditions for the protection of its personnel against the work stress. This is not addressed through the use of equipment or the provision of secure facilities but through the leadership of the management by understanding the personal and work problems of the employee and creating the appropriate conditions for relieving it and the development of good spirit and cooperation within the undertaking (staff meetings, catering, entertainment programs, sightseeing tours for staff, etc.).

- **Labor Relations:** Employment relationships are a cornerstone of organizational well-being. They are also mentioned in international literature as internal communication. Essentially, this function refers to the relationship and communication of employees and the administration of the organization's internal issues. The issues raised may relate to negotiations on salary cases, additional benefits, health, and safety issues, common objectives, and broader cooperation. Employment relationships are a key tool in Human Resources Management, whereas one of its objectives is to deal with personnel by giving priority to understanding their personal needs and emotions. This is the function for many researchers whose application gives the anthropocentric character of management, and also defines Human Resources Management (Boxall et al. 2009).

The functions of the Human Resources Management, depending on the way they are managed, determine the difference with Personnel Management. The elements of leadership, teamwork, the organizational culture or communication as was mentioned before, underline the focus of Human Resources Management in adding values and coordinated management policies (Crawshaw & Hatch 2014). The Human Resources Management shall "build" the foundations of its functions based on:

- (a) proper staffing such as the selection of suitable staff for the right post, with appropriate payment, training, and development of staff,
- (b) maximizing efficiency by setting objectives, providing incentives, additional rewards, and developing initiatives,
- (c) management of changes such as employee's replacement, change of jobs, attracting-recruitment of new staff and
- (d) general management - coordination, such as evaluation of staff performance, training, safeguarding their legal rights, etc. (Torrington 2014).

3. THE IMPORTANCE OF HUMAN RESOURCES MANAGEMENT ON LAW ENFORCEMENT AGENCIES-HELLENIC COASTGUARD

The need to develop human-centered management was carried out in a competitive environment with the ultimate aim of maximizing the company's revenues by improving the efficiency of its personnel. But are there grounds for applying it to Law Enforcement Agencies? How important is Human Resources Management to bodies which are not aimed at obtaining profits? What is the benefit of applying human resources management to non-profit-making organizations such as public services and specifically Hellenic Coastguard?

The Hellenic Coastguard is responsible for inter alia, sea-port and sea borders surveillance, prevention of illegal immigration, and protection of marine pollution incidents (Hcg 2021). The significance of implementing Human Resources Management in the Hellenic Coastguard, which may lead to an increase in the efficiency of its staff, is essential if one considers the multidimensional role that it plays in a country's social, economic, and political situation. Ensuring social and economic balance through the fight against crime or political stability through the best possible surveillance of borders and management of the migration phenomenon, the maximization of staff performance through a human-centered Human Resources Management appears to be imperative. Whether the Human Resources Management functions described above affect the performance of the staff and to what extent, has been examined through qualitative research to officials of Hellenic Coastguard.

4. METHODOLOGY OF RESEARCH

To investigate the influence factors of Human Resources Management on Hellenic Coastguard Performance, it was considered necessary to carry out a qualitative research of senior officials of Hellenic Coastguard who were placed in specific positions. The idea of this research came to present more facts about the importance of Human Resources Management and its relation to the performance of Hellenic Coastguard personnel. The technique of the research was based on purposive sampling. Twenty structured interviews of Coastguard officers were conducted, taking into consideration as the basic selection criteria their position (intermediate ranking officers who are commanded by senior

hierarchical officers and at the same time command lower hierarchical officers). All Officers are members of the Hellenic Coastguard who hold senior positions of Central Port Authorities in Greece and Headquarters of the Hellenic Coastguard. More specifically, the officers who took part in the structured interview are presented in the following table 2.

Table 2: Sample of quantitative research

Sample	Years of experience in Hellenic Coastguard	Current Authority
Officer 1	7	Port Authority of Thessaloniki
Officer 2	7	Port Authority of Thessaloniki
Officer 3	19	Port Authority of Thessaloniki
Officer 4	5	Port Authority of Thessaloniki
Officer 5	12	Port Authority of Igoumenitsa
Officer 6	14	Port Authority of Igoumenitsa
Officer 7	10	Port Authority of Corfu
Officer 8	12	Port Authority of Corfu
Officer 9	17	Port Authority of Volos
Officer 10	20	Port Authority of Volos
Officer 11	7	Port Authority of Piraeus
Officer 12	7	Port Authority of Piraeus
Officer 13	19	Port Authority of Piraeus
Officer 14	5	Headquarters of the Hellenic Coastguard
Officer 15	12	Headquarters of the Hellenic Coastguard
Officer 16	14	Headquarters of the Hellenic Coastguard
Officer 17	10	Headquarters of the Hellenic Coastguard
Officer 18	12	Headquarters of the Hellenic Coastguard
Officer 19	17	Headquarters of the Hellenic Coastguard
Officer 20	20	Headquarters of the Hellenic Coastguard

The qualitative data collection method was structured on interviews, by using pre-organized questions. This research allowed understanding the factors that affect Hellenic Coastguard personnel performance, its perception of Human Resources Management and its functions, and which Human Resources Management functions affect their performance most. About the analysis of the results of the research, a deductive approach was used in which the data were grouped and compared for similarities and differences. This approach led us to classify the type of qualitative analysis in which the answers of the interview were categorized to be summarized while assisting the purpose of tabulation, as well. Finally, a very important fact has to be mentioned in the interest of the interviewers to gain knowledge of the facts that were cited on the questions of the interview and the final results of the research.

5. PRESENTATION OF FINDINGS

In the first part of the interview, officers were asked about the factors that can influence their performance in the working environment. In particular, the officers were called to respond, spontaneously, about the factor that can affect their performance positively or negatively. All officers mentioned that the most important factor which can influence their performance is internal cooperation and communication among the personnel of the agency they work for (HRM function of labor relation). They referenced the characteristics of the team willingness for performance, the common staff communication, the existence of a common vision and culture with senior management, and leadership spirit by the leader (quality features of HRM). In addition, in the spontaneous recording of performance influencing factors, 25% of the sample (5 officers) reported their selection parameter at the position they desire and have the corresponding qualifications (HRM function of selection), 20% of the sample (4 Officers) reported the major influence on their performance that plays the providing training in the work they are engaged in (HRM function of training) and the objective assessment and evaluation of their performance (HRM function of performance evaluation). Finally, 10% of the sample

(2 officers) reported the correct description and distribution of responsibilities at the workplace they have taken (HRM function of job analysis), but also the possibility of developing them with the acquiring long-term experience and training (HRM function of development).

Figure 1: Factors influencing performance according to HCG personnel

In the second part, officers were asked about their perception of the term of Human Resources Management to understand the level of their knowledge about its principles. All officers responded that Human Resources Management is a strategy of managing employees to maximize their performance. The 75% (15 officers) responded that Human Resources Management is related to meet the needs of personnel (HRM function of planning) and place appropriate staff in appropriate positions based on objective qualifications (HRM function of selection). Also, 15% (3 officers) reported that the Human Resources Management is linked to the personnel training process (HRM function of training), 10% (2 officers) with the staff remuneration procedure (HRM function of compensation) and their evaluation (HRM function of evaluation) and finally 5% (1 officer) included the responsibility of the Human Resources Management in the employment relationships (HRM function of labor relations).

Figure 2: Perception of HRM according to HCG personnel

In the third part, explained to the officers the functions of Human Resources Management, and they were called to classify the functions that influence their performance most. It is noted that all officers, after analyzing the subject of each function separately, reported that, more or less, they all affect their performance. In particular, the function of job analysis and labor relations has a high impact on the

performance of officers (100%), the functions of training-development and performance evaluation have a high impact on the performance of 90% of officers and a low impact on the performance of 10% of officers (2 officers), the function of human resources planning has a high impact on the performance of 80% of officers (16 officers) and a low impact on the performance of 20% of officers (4 officers), the function of the recruitment and selection of staff has a high impact on the performance of the 50% of officers (10 officers) as well as a low impact. On the other hand, the function of health and safety significantly highly affects the performance of 25% of officers (5 officers) and a low level the performance of 75% of officers (15 officers) and finally, staff compensation affects to a high degree the performance of 5% of officers (1 officer) and to a low degree the performance of 95% of officers (19 officers).

Figure 3: Level of HRM influence according to HCG personnel

6. CONCLUSIONS

The hypothesis raised about the importance of Human Resources Management in the performance of personnel in the Law Enforcement Agencies has been fully confirmed according to the results of the research and at the same time, very important findings were discovered about the factors influencing the job performance of Hellenic Coastguard personnel.

In the first part of the research, was requested by the officers to spontaneously identify the factors that may affect their performance. The characteristics of the team cooperation and distribution for performance and the existence of a common vision and leadership of management which has been recorded, are the main qualitative characteristics of the Human Resources Management which distinguish it from the Personnel Management, as they were described in table 1. This fact, establish the need of applying Human Resources Management to personnel, to maximize its performance.

In addition, important research data highlighted the common view of all officers in the importance of internal communication and work relations between employees, which refers to one of the basic functions of Human Resources Management which characterize it most; the function of Labor Relations. Furthermore, officers recorded as factors of influence in their performance, their choice in the workplace they wish to work, the provision of training, the description of the job assigned to them, the evaluation of their performance, and their development through their work, which are all related to Human Resources Management practices of Planning, Evaluation, Education and Development of the personnel and proves its importance and affection on maximizing performance.

Completing the first part of the research, officers were asked to record how they perceive the concept of Human Resources Management, to be recorded whether the officers are aware of the link between the factors that influence their performance and the objects of the Human Resources Management. The

overwhelming majority of the sample (75%) referenced that Human Resource Planning is the main object of Human Resources Management, covering essentially the need for personnel quantitatively and qualitatively, while at a small rate referenced to the provision of training, compensation, and performance evaluation. It was impressive that the function of labor relations even though was mentioned as the most important factor influencing the performance of all officers, only one officer (5%) referenced it as a subject of Human Resources Management. This demonstrates that any failure by senior officers to implement the functions of the Human Resources Management may be due to their lack of awareness of Human Resources Management objects. In support of this hypothesis, all officers reported that they had not been educated on the subject of Human Resources Management in their academy, its functions are not being satisfactorily implemented in their service and they noted that it plays a definitive role in maximizing their performance, which confirms the original research theory.

In the third part of the research, officers were asked to classify the functions of the Human Resources Management according to the level of impact on their performance (high or low impact). As it was expected from their spontaneous records on influencing factors in the first part of the research, all officers reported labor relations as a high-performance factor, as well as the 80% to 90% of officers, the factors of education and planning. Shared importance as a factor of influence is the selection of personnel (50% of the sample reported as high and low), while the vast majority of officers mentioned low influence of their performance the function of staff salaries (95% of the sample), and health-safety environment (75% of the sample). The findings clearly illustrate which functions of Human Resources Management are more important than others. For example, an employee with the proper training, in the right position, and with the right communication and cooperation relationships with the rest of the workers, maximize its performance, regardless of the compensation factor and the conditions of the working environment. This is clearly due to the type of organization that employs the staff, and the level of influence of these factors will likely vary in the private sector. The Hellenic Coastguard is a Law Enforcement Agency that belongs to the public sector. According to the results of the research, the officers appear to have accepted the level of their salaries as they are specific for all staff working in the Coastguard (salaries are predetermined and constantly developing on a position-held scale) and even if they don't feel that they are rewarded enough, they have accepted this fact and therefore does not significantly affect their performance. Similarly, as regards working conditions and the health and safety environment, the staff appears to have accepted the conditions provided by the Public Sector and have been adjusted to work under these conditions from the outset of their recruitment. On contrary, in the private sector, these conditions could be of great importance, and staff may not be so flexible and choose to work for another organization.

In conclusion, maximizing the performance of personnel in law enforcement agencies through the implementation of Human Resources Management may differ in terms of the result of private organizations which focus on maximizing their profits. However, the increase of law enforcement efficiency offers a very significant benefit to the state with enormous economic, social, and political implications. The contribution of Law Enforcement Agencies to the social, economic and, political stability of the country, takes place through the fight against crime and the best possible border surveillance-management of the migration phenomenon. Particular importance is placed to the above-mentioned balance of the state and the role of the Hellenic Coastguard with its additional competence in the research and rescue of people at sea and the protection of the marine environment. Maximizing the efficiency of the staff is an essential condition for achieving these objectives. According to the research results, the application of Human Resources Management plays a determining role in the performance of employees. The sample underlined that Labor relations, Human Resources Planning, training, selection, job analysis, and performance evaluation are considered the most important functions of maximizing the performance of the employees. In contrast, the working environment conditions or compensations play a less important role in the officer's performance and this fact proves that simply by implementing a specific management method, without imposing any financial burden on additional salaries or facilities, it is possible to maximize the performance of an organization like Law Enforcement Agencies which offer multiple benefits at a collective level.

evadashi@ubt.edu.al

Abstract: This study aimed to measure the effects of subsidies that the Albanian Government has provided to farmers, through its measures for the National Agricultural Policy. The purpose of the study is an economic-political assessment of how subsidies measures to farmers in Albania are conceived, designed and implemented.

The analysis of the study began with a review of the literature on agriculture and rurality at the national and European levels. This analysis is mainly based on the documents of strategic programs in Albania in the field of agriculture, from 1992 until today. There has also been a literature review based on the Common Agriculture Policy (CAP) strategic programs, from its structural design to the present day, as Albania is already a candidate country for European Union (EU) integration.

Following the literature review, the study focused on data collection to experts at national level, to donors assisting the agricultural sector in Albania and. These data helped determine the areas and sectors where the study focused. The final data collection was carried out through field surveys, with farmers, but also through the analysis of previous studies related to this topic. The study is based in the analysis of two groups of farmers, those who have benefited from the subsidies and the farmers who have not benefited from governmental support but that they have financed with their own resources the further development of their farms.

This study is valuable for experts who work in the agricultural policy sector, but also provides a detailed point of view, both in financial and economic terms on the efficiency and effectiveness of the implementation of the National Agricultural Policy in Albania, in the context of regeneration and strengthening the agricultural sector, as a powerful engine for the development of the country's economy.

Also, studies of this type are new, but also very rare in Albania. Given the legacy of a centralized agricultural sector, but also of the problems it faces today:

- overemphasized parcelization of agricultural farms;
- lack of investment and mechanization;
- lack of irrigation and water resources management;
- lack of cooperation between farmers;
- lack of markets which can attract agricultural products;
- lack of interest in working in agriculture, especially at young ages.

By the data analysis, it is clear that farmers who have benefited from subsidies have not invested aiming at expanding the surface of their farm. While on non-subsidized farms, there is a slight growth. Subsidies have not served as an incentive for farmers to invest and increase their production capacity, compared to non-subsidized farms, which, although without any governmental support, have made more significant investments and achieved higher efficiency at production and sales levels.

The support for the beneficiary farms contributes to cover part of the financial expenditures that some farmers make for planting and investing in increasing production. However, it does not affect the orientation to manage farm production, which should also be the main objective of this support.

Keywords: Agricultural subsidies, agricultural sector, National Agricultural Policy economic-political assessment.

1. INTRODUCTION

The agricultural sector in Albania still suffers the consequences of the transition after the communist period, Until the 1990s, the agricultural sector was characterized by mass collectivized farms (cooperatives). After 1992, with the transformation of the political and economic system, agriculture also underwent a radical change. The most import transformation, at that period was the conversation of land from state owned into private property (Law No. 7501, in 1991). However, it brought a negative phenomenon, the creation of very small extremely and largely parcelized agricultural farms.

Currently, Albania is a candidate country for full membership into the European Union (EU), and as such its agricultural policy must be in line with the plans and measures implemented by the EU's Common Agricultural Policy (CAP). In the context and process of approximation, since 2007 the Albanian Ministry responsible for the Agricultural sector has implemented a National Support (subsidies) Scheme. However, although years have passed since the first implementation of the annual schemes, there are very few studies on the impact of the produced by this scheme and the lessons learned. For this reason, this study aims to contribute with concrete findings regarding this policy.

The study aims to measure the effects of subsidies provided to producers of agriculture goods, through the annual National Support Scheme. The main objective is to assess the economic-political methodology on how the measures have been conceived, designed and implemented. Also it analysis the financial impacts produced on agricultural farms.

The study is valuable for researchers and experts working with agricultural policies, and provides also a very detailed perspective in financial-economic terms on the efficiency and effectiveness of the implementation of the National Agricultural Policy in Albania.

After the fall of the communist regime, the Ministry responsible for the Agricultural Sector, in collaboration and with the assistance of different Donors, designed many development strategies for the sector, but there were the two inter-sectoral strategies (2007-2013 and 2014-2020) that brought the National Agricultural Policy closer to CAP and permitted the design and implementation of the annual National Support Scheme.

2. METHODOLOGY

The study assesses the relationship between the public subsidies, provided in 2007-2008 period and farm management efficiency, undertaking an analysis of the results found in the field, studying existing reports and discussing with responsible experts in drafting the subsidy scheme. With a focus on two productive crops, Olives and Vineyards, in the areas of Shkodra, Lushnje and Fier.

The subsidy scheme, in the period 2007-2012, aimed to increase agricultural production. It provided the support through several measures aimed at increasing the surface planted and orienting production in some agricultural crops. The main support was given to planting and increasing production with Olives and Vineyards. Therefore, the study is focused in the analysis of farms cultivating these commodities. After 2007, the number of farms cultivating Olives and Vineyards increased significantly. For this reason the interest to analyze, whether the main factor was the support with subsidies or they were driven by other factors. The areas of Shkodra, Lushnje and Fier received almost 1/3 of the total funds to plant Olives and Vineyards.

2.1. Data collection

The first data, for the study, were collected by in 2013 with two groups of farmers, those benefited from subsidies and those who did not. In May 2018, statistical data from 2013 were updated. The same farmers who were surveyed in 2013 were surveyed again. The goal was that, after 9-10 years, for Olives and Vineyards, in Shkodra, Lushnje and Fier, the full impact of subsidies could be analyzed.

Table 1: Distribution of surveys by area and typology of farm

	with subsidies			without subsidies		
	Total	Olives	Vineyards	Total	Olives	Vineyards
<i>Fier</i>	60 (52%)	50 (83%)	10 (17%)	40 (54%)	37 (92%)	03 (08%)
<i>Lushnje</i>	30 (26%)	0 (0%)	30 (100%)	28 (38%)	04 (14%)	24 (86%)
<i>Shkodra</i>	25 (22%)	13 (52%)	12 (48%)	06 (08%)	05 (83%)	01 (17%)
TOTAL	115	63 (55%)	52 (45%)	74	46 (62%)	28 (38%)

Source: Personal survey's and their editing

During May 2018, 230 surveys were conducted, of which, the valid surveys that were considered are 189. In the table 1 above is reflected the distribution of surveys taken in the study.

2.2. Data analysis

Data collected in the surveys, during 2013 and 2018, were organized into a unified database, based. Subsequently, the data began to be selected and grouped according to the various features obtained in the analysis. To analyze the data and to come into conclusions. For this reason, two methods of analysis were used:

- i. Descriptive analysis (empiric method);
- ii. Propensity Score Matching (PSM).

The descriptive analysis expresses, through time variables, a constant interpretation of events in different periods:

- presentation of time variables on the factors taken into analysis in the study and elaboration of the valid statistical model;
- graphical presentation and analysis of timely data flows (i.e. surface, production, sales, etc.).

Descriptive analysis does not mean statistical tests but it is used to reflect problematics in analytical form. PSM analysis the changes in results that are dedicated only to the attribute of subsidy, by pairing farms in two groups that have similar characteristics. Common compliance methods, applied in PSM are: exact matching, optimal matching, sub-classification, nearest neighbor, optimal matching, genetic matching, etc.

To perform PSM, were selected a set of summary variables that represent the overall characteristics of the farm, as well as the main attribute "Support_2008" or otherwise the treatment variable, or the dependent variable (you received a subsidy). For the analysis, the statistical package R was used, in which the additional MatchIt function was integrated, designed for PSM. In the analysis, a match was made between 74 treated cases and 74 control cases, for both categories, shows that they are very similar in the selected variables.

3. STUDY RESULTS

Based on the Descriptive analysis, in the subsidized farms, the average production surface did not change. Interesting observation, in the non-subsidized farms, the surface slightly increased by 9% average. Although there has been no significant increase in the average surface of production, the number of roots has increased several times in both farms typologies. We get the conclusion that farmers converted their production toward Olives and Vineyards, by replacing traditionally planted crops. This tendency was not driven by subsidies, but by market demand, because the number of roots has increased over 8 times in in non-subsidized farms and only 3 times in subsidized farms. From the results of the survey and from the above analysis, the production of the two commodities has been in strong expansion. Nevertheless, production has almost doubled in the non-subsidized farms. This statistic proves the fact that farmers who invested their own funds were more successful and efficient than farmers who invested through subsidies.

From the data analysis, the results show that the growth of Olive as a product has been strongly influenced by subsidies, while Vineyard have not been affected by the subsidies. A preliminary study, in the design of the support scheme, would have had evidenced the market's need for Olives subsidies, as a product that should have been stimulated to increase production. Meanwhile, Vineyards could not have been subsidized, or subsidized at lower levels, because the farmers themselves, with their own funds, were willing to make the necessary investments in this commodity. The PSM model analysis confirms some of the results of the descriptive analysis, confirming the very low impact of the subsidies in the further growth and development of the two commodities in all three geographical areas. It is confirmed that the subsidies provided have not served as an incentive for farmers to invest and increase the production capacity on their farms, for the two commodities analyzed. This model also confirms that the support from the Ministry responsible for Agriculture was not provided with the purpose to orientate the agricultural sector towards the first set commodities, but was limited only to follow and support initiatives already undertaken by farmers themselves.

In all cases it is noticed an impact that does not exist, or sporadically, of subsidies in strengthening and developing farms which cultivate Olives and Vineyards. As assessed during the descriptive analysis, farms that did not receive subsidies, in most cases, turned out to have a more positive performance compared to the farms that benefited. There is no impact of subsidies on average farms size without subsidies. At productivity level the same phenomenon is observed, there is no impact of subsidies and non-subsidized farms have increased their productivity almost 2 times more compared to beneficiary farms. Similar trend in yields levels of production, except Olives where there has been a slighter growth on supported farms.

3.1. Characteristics based analysis

As shown in the figure 1 below, the survey’s results, for the average surface of the farm, reflects two different realities:

- i. In Shkodra, subsidies the impact of subsidies was positive because the surface of farms has increased. The same impact was not noticed in the non-subsidized farms.
- ii. In Lushnje was noticed the opposite impact. The subsidized farms slightly increased their surface, while in the non-subsidized farms no impact was noticed.
- iii. In Fier the impact was quite similar to Lushnje, as a slight increase was noticed in the subsidized farms and there was no impact in the non-subsidized farms.

Figure 1: Average surface of farms in Ha, by geographical areas and subsidy provided

Source: Personal survey's and their editing

Figure 2: Average production in Tones, by geographical areas and subsidy provided

Source: Personal survey's and their editing

As shown in the figure 2 above, the survey's results, for the average production, still reflect different realities, but this time there are differences even between Lushnje and Fier:

- i. In Shkodra there was a strong increase in production in the non-subsidized farms compare to a lower increase in the subsidized farms
- ii. Lushnje has the same impacts has Shkodra. Both categories of farms noticed a strong increase in their production, but in the non-subsidized farms the increase in production was quite higher than in the subsidized farms.
- iii. In Fier, was noticed the opposite impact. It was noticed an increase in production in the subsidized farms, while there was no increase in the production level of the non-subsidized farms.

During the period 2008-2017, on general the production yields grew over 5 times. The opposite trend is observed in Fier and Shkodra to some extent. In Fier, on non-subsidized farms, the growth is almost negligible. Whereas in the subsidized farms in Fier and in the two typologies of farms in Shkodra, the growth is about 3 times. The farms in Lushnje have experienced extraordinary growth, where subsidized farms have increased yields by about 7.5 times, while non-subsidized farms by about 14 times.

Figure 3: Average yield (Ton/Ha), by geographical areas and subsidy provided

Source: Personal survey's and their editing

Interestingly, in both farms typologies most farmers have invested heavily in 2008-2012. It is noticed that during the years 2013-2017 the level of investments has decreased significantly, compared to the years 2008-2012. On subsidized farms in 2008, the level of investment has fallen by about 3.5 times, while on non-subsidized farms by about 2.5 times. The same downward trend is followed in the number of farmers that have invested during the 2013-2017 period. About 60% of farmers have still invested in non-subsidized farms, while only 40% of farmers have on subsidized farms.

Table 2: Investments in farms, during the years 2008-2017

		2008-2012				2013-2017				2008-2017	
		Po	Jo	%	Total	Po	Jo	%	Total	Total	%
subsidized	Po	96	83%	4,736,140	48%	46	40%	1,351,113	39%	6,087,253	46%
	Jo	19	17%			69	60%				
not-subsidized	Po	67	91%	5,149,324	52%	45	61%	2,074,658	61%	7,223,982	54%
	Jo	7	9%			29	39%				

Source: Personal survey's and their editing

3.2. Commodity based results

Both production level and yields have experienced an extraordinary growth for the Olive. Yields growth rate was lower than production. On both fields, highest growth rates have been observed in the subsidized farms. Lushnje has a different trend because the highest growth rates were observed in the non-subsidized farms.

Figure 4: Olive, by geographical areas and subsidy provided, during the years 2008-2017

Source: Personal survey's and their editing

Olive production in Albania has experienced an extraordinary growth, with the highest growth has been noticed in the subsidized farms. Yields have also increased, surprisingly at lower levels compared to production, even in this case the highest growth has been noticed in the subsidized farms. The same trend is maintained in sales growth, where the highest rate has been registered by subsidized farms with about 8.5 times, while non-subsidized farms with almost 4 times.

Lushnje makes a difference again. Compared to Shkodra and Fier, where the highest growth is observed on non-subsidized farms. It should be noted that the sales of Olives in Shkodra have decreased. But also the decline in production yield on non-subsidized farms in Fier.

Figure 5: Vineyard, by geographical areas and subsidy provided, during the years 2008-2017

Source: Personal survey's and their editing

Vineyard production growth was even higher than Olive, almost 19 times in 2017, compared to 2008. In Lushnje the growth was slightly higher, over 21 times. In Shkodra, production has increased almost equally in both typologies of farms. Production yields have increased more in non-subsidized farms.

4. CONCLUSIONS AND RECOMMENDATIONS

Subsidies did not incentivized farmers whom benefited to invest aiming in expanding their farm surface. On contrary, in the non-subsidized farms there is a slight growth of 9%. Over the past decade, it was noticed a very important expansion in the production levels for the two commodities. In Olives, the highest investment have been made in the subsidized farms, while in Vineyards in the non-subsidized farms. Subsidies have affected mostly the Olive farms, while the Vineyard have not been affected at all by the subsidies provided, because the highest levels were registered in the non-subsidized farms. The analysis by the PSM method, confirms some of the results obtained through the descriptive analysis, which proves the very low impact of subsidies on the further growth and development of the two commodities, in all three areas. However, the Olive farms have been strongly affected by subsidies.

Subsidies have not served as an incentive for farmers to invest and increase their production capacity, compared to non-subsidized farms, which, although without support, have made more significant investments and achieved higher efficiency results at production and sales levels. The subsidies provided did not affected farmers orientation of production. This should be one of the primary objectives of a subsidy scheme. Especially when consider the low level of surface and productive capacity of farms in Albania. In some cases, negative externalities have been registered. Due to the continued support for commodities that have been already present in the market, the strong increase in production quantities has caused a reduction in the selling prices. In the non-subsidized farms, investments have been made based on very good designed business-plans, and the needs and bottle-necks were also better identified. This should also be the approach where farms that apply for subsidies should be oriented in the future, the core should be a detailed business plan, which contains integrated investment measures.

Abstract: The paper is part of a research series for ancient Roman sites in Northern Bulgaria which aim to present the possibilities of creating a specialized form of cultural and historical product that ensures sustainable utilization of the Bulgarian tangible heritage. A study of the Roman fortress Sostra, located on the Via Traiani road as a cultural and historical tourist resource was conducted. The castellum is characterized as an object of cultural heritage in the region of Troyan Municipality in Bulgaria. The methodology applied in assessing the potential of the Ancient Roman fortress Sostra is primarily designed for historical and cultural sites. An evaluation was made under the following criteria: potential for development, degree of impact / interaction, degree of modification with relevant indicators. Also an expedition-field method for terrain research was applied. Summaries and conclusions were made in order to highlight the possibility of forming a tourist product of cultural and cognitive tourism.

Keywords: tourist resource, cultural tourism, tourism policy, regional development.

Introduction

Bulgaria is a country with a unique cultural and historical heritage. Historically, the country existed among the most ancient civilizations and cultures such as the Thracian, Roman and Old Bulgarian. Almost 40,000 registered sites dated back to different historical eras are a proof for the richness of Bulgarian cultural heritage. Seven sites have the status of immovable cultural values of global significance and more than 10 000 have national heritage importance. Bulgaria ranks third in Europe after Greece and Italy for the number of its valuable archaeological and cultural monuments (National Strategy for the Sustainable Development of Tourism in Bulgaria 2014-2030). This makes cultural tourism a promising sector for developing and allows Bulgaria to become a regional leader in Central and South-eastern Europe. European and global trends in tourism development also support this assertion.

A survey, requested by the European Travel Commission (Ministry of tourism), which has studied preferences and reasons for travel of tourists, visiting Europe, shows that relatively high proportions of tourists who go on a holiday in European destination are the most likely to say that cultural and sports tourism are a concomitant goal to travel (39%). In turn 45% of Russian tourists visiting Europe combine the holiday with cultural activities. Tourists from Canada (60%), Japan and Korea (34%) have the same motivation to travel.

In 2018 Bulgaria was visited by a total of 9 273 345 foreign citizens (Ministry of tourism, statistics). The share of European tourists is 61,4%, Russian – 5,6%, Ukrainian – 4% and Canadian – 2%. In this regard, more than 70% of the tourist flow to Bulgaria for 2018 has a potential for diversification through cultural tourism product. However, the holiday tourism retains its leading position for the same period – 62,6% of all tourist visits. Analysis of the Bulgarian tourism market shows that the share of cultural tourism is slightly above 10%. It must be emphasized that the potential of Bulgaria to develop cultural tourism and the demand for such a product from outbound tourism market do not match the actual supply.

The contrast to Bulgaria's positioning worldwide is even more pronounced. By the Natural and Cultural Resources subindex which is a part of the Travel & Tourism Competitiveness Index (TTCI) 2015 framework, Bulgaria is rated 1.96. By this subindex ranking the country attains the 54th position out of 141 countries included in the survey as in the Balkans only Montenegro is after Bulgaria (Levkov, 2017). The TTCI benchmarks the T&T competitiveness of 141 economies. It comprises four subindexes, 14 pillars and 90 individual indicators, distributed among the different pillars. The Survey data is derived from responses to the World Economic Forum's Executive Opinion Survey and range in value from 1 to

7. Each of the pillars has been calculated as an unweighted average of the individual component variables (Travel & Tourism Competitiveness Index, 2015).

Reasons for poor performance of Bulgaria at cultural tourism market are complex and they are listed in founding documents for tourism development such as "Strategy for Sustainable Development of Tourism in Bulgaria 2014-2030" (Ministry of tourism, Bulgaria). Therefore, the topic will not be discussed in detail. For the purposes of this study will be pointed out that one of the main reasons for this is the insufficient readiness of objects of tangible cultural heritage from potential tourist resource to become a basis for setting up competitive tourism product.

Material and methods

The study is part of a survey of ancient sites on the territory of Pleven and the region. As a territory bordering Romania, sites located in the region can become the basis for development both for an internal and international tourism. This will contribute to the balanced economic development of the region and the alternative employment of labor resources. In this connection, ancient sites are considered as a resource with a potential for tourism development.

The study aims to present the possibility of creating a regional tourist product based on the ancient Roman castellum Sostra. In the specialized literature the tourist product is defined as a concept that contains a substantial material substance and at the same time it is also a set of services. The tourist product also includes resources and attractions, conditions and infrastructure, activities, imaginative presentations and values. Together they have to meet the needs of a particular group of users. It is clear that services are the basis of the tourist product while it has also a material basis, such as tourist resources (Banabakova, et.al. 2017). They are one of the factors motivating potential tourists to choose a destination. In this case it is the cultural heritage in the district of Lovech, namely the ancient Roman castellum Sostra.

The following tasks will help to achieve the above goal:

1. A characteristic of the site is presented.
2. An evaluation of the potential of cultural and historical tourism resources of the ancient Roman castellum Sostra according to specific criteria is made.

In assessing the potential of ancient Roman castellum Sostra, a methodology has been applied that reviews the site as an anthropogenic tourist resource. According to the Methods for evaluation of cultural and historical tourist resources and their potential, the following three criteria for evaluating are used:

1. Capacity (potential, ability) Development (CD) - consistent with the factors and conditions for development of the resource.
2. Degree of impact/ influence – the level of attractiveness is estimated.
3. Degree of modification (resulting from the tourism) - evaluation of utility/ value/ significance of the tourist attraction.

For the assessment are used:

- ✓ method of point rating - a certain number of points is awarded by the selected characteristics of cultural and historical resources, specific indicators to measure them and aggregate subjective opinions;
- ✓ the sum of the awarded points from the total rating of the given object;
- ✓ selected characteristics and corresponding indicators have different weight in the assessment, which is defined in points (1 to 100);
- ✓ the maximum number of points for a certain object is 100 and it is formed as a sum of the points for each of the selected and evaluated characteristics and indicators;

- ✓ a scoring matrix is developed which takes into account the main characteristics of cultural and historical tourist resource Roman castellum Sostra, used in the measurement and evaluation along with their inherent indicators - significance and weight (Table 1).

The following research methods are used in the study:

- ✓ expedition field method - field work, the method of observation and interview method;
- ✓ mapping method;
- ✓ expert evaluation method as a part of heuristic evaluation.

The authors have complied with the idiographic approach that highlights the unique features and competitive characteristics of the site.

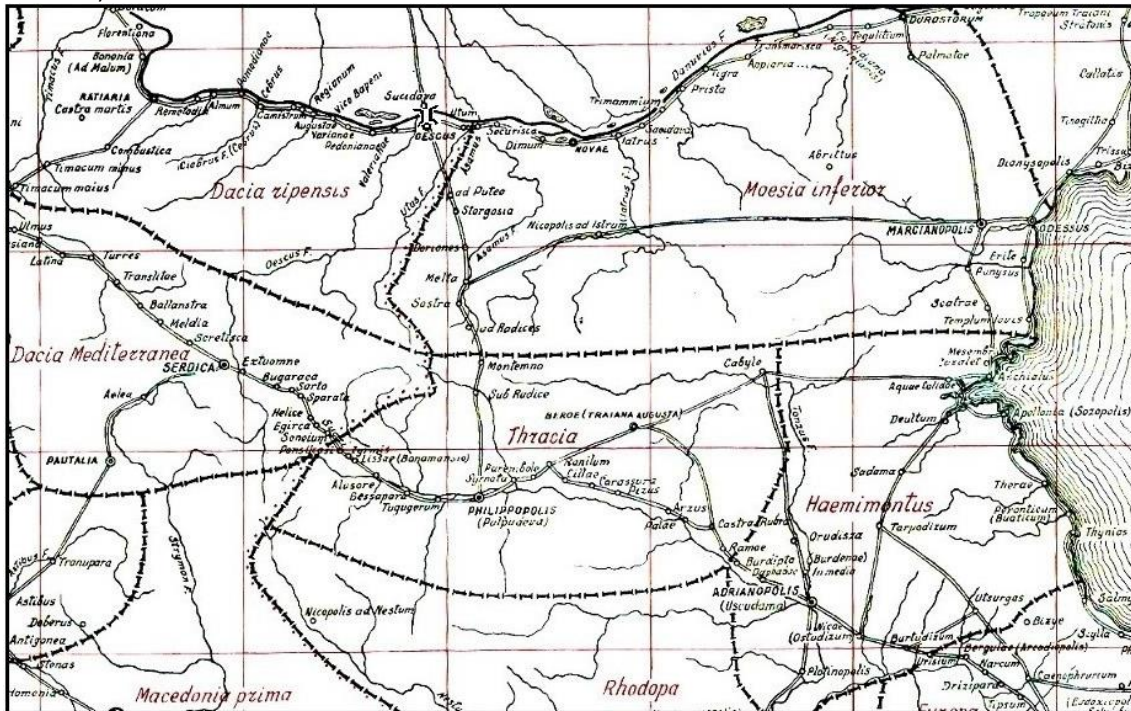

General characteristics of Roman roadside station and castellum Sostra

In the first third of the first century AD, the territory where the Roman road station and castellum Sostra are situated was part of the Roman Empire as the province of Moesia. This is a consequence of long military campaigns completed during the time of Emperor Tiberius, reigning from 14 AD to 37 AD. Romans built many roads that serve the army, administration and trade within the Empire and beyond (Figure 1). Trajan time is part of the road system of the Roman Empire. Its construction began during the reign of Tiberius (14-37) but was finished and actively used during the Emperor Trajan (98-117) when he transformed Dacia (Dacia Trajana) into Roman province. After Philippopolis Via Traiani was incorporated into another great Roman road – starting from Singidunum (today the Serbian capital Belgrade) continuing to Serdica (mod. Sofia), Philippopolis (mod. Plovdiv) and Adrianopolis (mod. Edirne in Turkish Thrace). At certain distances along the main roads the Romans built roadside stations and ancient castrum (fortified military camp) that served as a protected place for accommodation, storage facilities for food, weapons, horses changing point, and administrative records. According to a Roman road map (illustrated itinerarium), known as *Tabula Peutingeriana*, the way stations via Trajan's road on Bulgarian territory were nine: **Oescus 14** Roman miles (village of Gigen, Pleven district), **Ad Putea 7** (village of Riben, Pleven dist.), **Storgisia 11** (Pleven), **Doriones 10** (village of Slatina, Lovech district), **Melta 13** (Lovech), **Sostra 10** (village of Lomets, Troyan district), **Ad Radice** (village of Beli Osum), **Monte Naemno** (Beklemeto), **Sub Radice** (village of Hristo Danovo, Plovdiv district).

The Roman roadside station and castellum Sostra is situated on a territory which in the Pre-Roman period (1 BC) is associated with the lands inhabited by the Thracian tribe of Krobyzoi. Sostra is the sixth station, serving Via Trayana. "Sostra" from ancient Greek means belt, bandaging, barrier). The castellum is located in the Osam river valley. It is part of the Troyan Fore-Balkan. It consists of low hills with an east-west stretch, cut from the rivers, in this case from the valley of the Osam River through the village of Lomets.

On the cartosheme, it is well seen (Figure 1) that Sostra is situated directly on the Roman road and it is the last one before it enters the central mountain massif.

Figure1 Schematic map of Roman roads in Bulgaria in IV –VI centuries (Source: Tapkova-Zaimova, V., V.Velkov)

Today, apart from the section studied at Sostra, sections of it are preserved in the Central Stara Planina (figure 2).

The castellum Sostra is located 150 km east of Sofia 150 km, near the village of Lomets and about 16 km north of the town of Troy and 28 km south of Lovech. The location of the fortress is strategic, because the access to the south to Troyan was controlled, and the roadway was in the immediate vicinity of it. The eastern (main) gate of the fortress was turned in the direction of the “Kalugerskoto” locality, from where it was the only passage to the upper course of the Osam River.

Figure 2: A section of Via Traiani in the Balkan Mountains (authors' archive)

Sostra was twice destroyed by the Goths in the middle of the 3rd and the second half of the 4th century, but it was recovered after these invasions. Initial archaeological studies showed that Sostra included settlements, necropolises, a roadside station and a strong fortress (castellum). The entire valley where the the fortress is situated covers an approximate area of 4 km². Sostra was founded in the middle of the 2nd century and it existed for more than 300 years. Four construction periods have been established. Sostra fort was built around 145 AD at the order of Roman Emperor Antoninus Pius during his fourth consulate (Hristov, 2011). Around 147 AD the cohorts II Mattiacorum was stationed in Sostra and the construction of the the castellum began. It was so called cohorts milliaria, i.e. around 1000 soldiers (milliaria). There are evidences of the presence at a later stage of Cohors I Cisipadensium in Sostra, First Spanish Gordian cohort (cohors I Hispanorum Gordiana), and part of the I Aurelian Cohort.

In the late period of its existence (IV-V centuries) barbaric mercenaries played the role of militia. With the invasions of Goths and Huns, the castle of Sostra lost its military significance and it became a civilian settlement. Sostra was completely destroyed by the Huns at the end of the 5th century. In the 19th century a small road inn called "Lomeshki Hancheta" was built.

Sostra is a base camp. According to Hristov (2011) the Latin term "castellum" can be used for a fortified military camp. The term is a diminutive form of "castra". This term designated the bearings of auxiliary parts, as is the case with Sostra. It was found that the plan of this castellum is similar to a rhombus whose larger diagonal is oriented to the northwest - southeast (figure 3). The fortified territory covers an area of approximately 1.5 ha (125 m west-east x 121.5 m, north-south). Exact measurements allow the calculation of the standard sized cohorts quingenaria units. In its present form, Sostra presented a plan of a fortified fortress, the achievement of which occurred at the end of the 3rd century and the beginning of the 4th century. The fortress was built in strict compliance with the natural features of the plain around the Azamus River (today Osam River). At the center of the castellum was the principia or the military headquarters (figures 4 and 5). In front of the principia passed the main stree Via Principalis. Against it at right angles to Via Principalis passed the second main street Via Pretoria. Part of the fortification of Sostra castellum was implemented by towers at the gates and corners of the fortification. There are two types of towers - rectangular, flanking the gates in the middle of the curtain wall and rounded - at the corners (Figures 6 and 7). All towers in the castellum were covered with tegulae and imbrices.

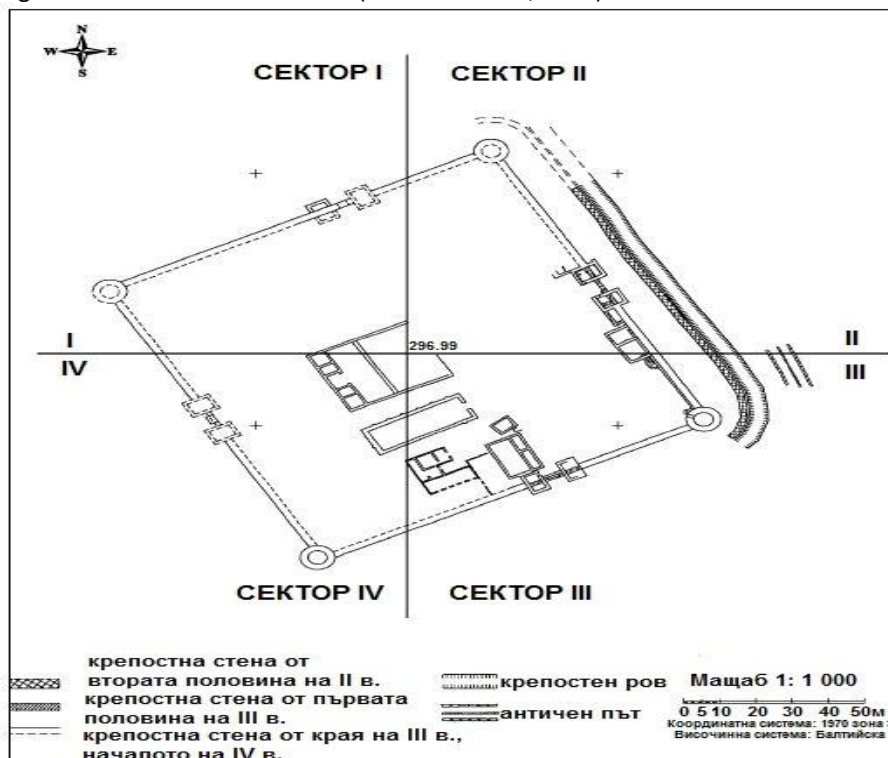

Figure 4 Via Principalis (authors' archive)

Figure 5 military headquarters (authors' archive)

Figures 6 and 7 Southeastern round tower and part of the Roman road (authors' archive)

The rectangular towers of Sostra are located in the middle of the fortress walls near the gates in order to secure and protect them. Their external dimensions, with a few exceptions, are the same 8 / 6,50 m. They are 1/3 out of the line of the fortress wall (Hristov, 2011), (figures 8, 9 and 10).

Figures 8 and 9 Eastern fortress wall with main gate and rectangular towers (authors' archive)

The Roman road passes immediately before the eastern fortress. A great length of the road is revealed, divided into two lanes with an axial line, a banquet and a width of 7 m (figure 11).

The organizational archaeological research of the Roman complex has been done by Dr. Georgi Kitov, Totyu Totevski, Assoc. Prof. Sergei Torbatov (National Archaeological Museum of Bulgarian Academy of Science) and Prof. Dr. Ivan Hristov (National Historical Museum). The first organized archaeological researches in the region of Sostra were held in 1979 under the guidance of Professor Georgi Kitov. Since 2002 there are regular exploratory and restoration activities under the guidance of Prof. Dr. Ivan Hristov from the National Museum of History and with the cooperation of the Municipality of Troyan and the Museum of Crafts. Major sections of the military camp, buildings from the civilian settlement, early Christian basilica, ceramic furnace, sanctuary of Thracian god rider, roadside station etc. were studied. During the excavations, silver coins, clay pots and jewels were found. Part of the findings are exhibited at the Museum of Crafts in the town of Troyan.

Evaluation of potential of the Ancient Roman fortress Sostra as cultural and historical tourist resource

Complex evaluation of cultural and historical tourist resources of Ancient Roman fortress Sostra is 57 points from maximum 100 possible points (Table 1).

Table 1 Main characteristics and indicators for assessment of the historical and cultural tourism resources of the Ancient Roman fortress Sostra

№	Defining characteristics (associated with the main criteria)	Indicators and metrics	Weighting (number of points)			
			Max	Max	For the object	Max for the object
1	Attractiveness (Criterion 2)	1.prominence/ popularity 2. combined with beautiful and diverse landscape 3. authenticity / preservation 4. uniqueness 5. beauty / exotic 6. cognitive / scientific value	1.5 2.3 3.4 4.5 5.4 6.4	25	1 - 2 2 - 3 3 - 4 4 - 3 5 - 3 6 - 3	18

TOTAL NUMBER OF POINTS FROM THE MAXIMUM (100)						57

Results and Discussion

By the "attractiveness" criterion 2, the site has been rated 18 by a maximum of 25 points. This is mainly due to the authenticity of the site, the beautiful landscape and its cognitive and scientific value. Under these criteria insufficient popularity is one of the weaknesses of the site. The "accessibility" criterion has the maximum rating points. The site has a built-in transport infrastructure. It is available for all types of

vehicles as well as on foot. Directly next to the main road there is a parking lot and signs are placed. A macadam leads to the fortress. A serious disadvantage is the safety of the site. Through it passes unsafe for pedestrians' railway line (figure 12).

Figure 12 Railway line Lovech – Troyan passes via castellum Sostra (authors' archive)

The indicator "Utilization for the needs of tourism" (criterion 3) is estimated at 69% of the maximum possible. This is due to the degree of exploration of the fortress, the restoration and conservation of the sites, as well as the exploitation potential that exists during the year. Lack of visitor data is an obstacle to fully assessing the subject under this indicator. This criterion has the potential for a higher grade.

For the good assessment of these two indicators is also contributed by the realized project of National Historical Museum and Municipality of Troyan related to exploration, restoration and conservation of Sostra.

Criteria "Importance" (criterion 2) has the lowest rating. In general, the site has local significance and it is not part of an ensemble. It is also not popular and interesting for tourists outside the region. Potential tourists can be attracted by incorporating the site as a cultural and historical tourist resource into a comprehensive regional tourist product.

According to the "Readiness to accept and service tourists" criterion the Roman roadside station and castellum Sostra received only 35% of the maximum points. The site has partly developed tourist infrastructure, but the lack of superstructure and trained staff reduces the its tourist value. At present, the site does not offer tour guide services. The visit mode is free. There is a lack of a permanent staff which reduces the satisfaction and aesthetic perception of the site by tourists and the opportunities for ongoing maintenance.

Conclusions

The Roman fortress of Sostra has the potential to form a tourist product of cultural and cognitive tourism. It is an archaeological site partly prepared for visiting by tourists. A competitive advantage is the location of the site next to the main road Lovech - Troyan - Troyan Pass. At the same time, the lack of developed thematic cultural and tourist product remains the object isolated and unknown to potential tourists.

There is, however, good practice in local government to turn Sostra into an attractive tourist destination. First of all, the municipality has acquired the castle as a property. Together with the state and public-private partnership, the municipality has invested funds in exploration, conservation and restoration of the site. In the planning documents of the Troyan municipality for the period 2014-2020, the sustainable development of tourism is considered as one of the five priorities for development of the region (Municipal Development Plan of Troyan for the period 2014-2020). The authors of this paper believe that good cooperation has been achieved between the Municipality and the National history museum, as a result of which in the beginning of 2019 the investment project: "Archaeological complex Sostra - restoration, exhibition and socialization of Roman castle and Roman roadside station – 1st stage" was presented. The investment project was prepared with funds from the municipal budget. It envisages preservation, exposure and socialization of Sostra. Main activities are: recovering Sostra's vision through conservation methods and technologies, as well as readable exposure solutions; providing access for people with mobility disabilities, alleyways and artistic lighting; creating an attractive part, safe passage of visitors through the railway line; Last but not least, build a visitor center as well as a dining and accommodation facility (Municipality of Troyan. News section). During the implementation of the project, the weaknesses in the above assessment will be removed and Sostra to a large extent will be completed as a tourist site. The question remains about the implementation of the project commitments, as well as how Sostra and other ancient sites in the region to be combined in a common thematic, regional tourist product. They are territorially located on three districts and two tourist regions. On the other hand, they are at a different stage of development as objects of cultural tourism. This makes it very difficult to coordinate efforts to achieve progress in this direction. One of the reasons for this is the weaknesses of the current tourist zoning of the country (Levkov&Lakov, 2018). More than 5 years the destination management system is not working properly which could be one of the possible solutions to the discussed problem.

Abstract: In recent decades, under the influence of the so-called "cultural turn" in the social sciences and the process of globalization, scientific and professional interest has increasingly focused on comparing and understanding the similarities and differences between legal cultures, as well as interpreting the impact that different legal cultures can have on international business and vice versa. Starting from a review of different definitions of the concept of legal culture as one of the most complex and controversial concepts in the study of law and society, this paper focuses on "external legal culture". The aim of this paper is to present and analyze the relevant literature to point out the double impact and connection between legal culture and international business. Firstly, legal culture can be analyzed as independent variable in research of the impact and connection between culture and international business. In this sense, this paper emphasizes and analyzes the application of some results of Hofstede's research model of "national culture". Accent is on "uncertainty avoidance" and "individualism/collectivism" as cultural dimensions in Hofstede's model. Results and theoretical connotations regarding these dimensions are associated with other cross-cultural studies of values and attitudes relating to law and legal culture. Secondly, national legal cultures are strongly influenced by various processes of globalization, to the extent that today we can point to the possibility of moving to a global legal culture. According to Friedman, modern or global legal culture is directed towards the convergence of legal cultures, and towards the culture of individualism, with special emphasis on human rights. However, such idea may be related to the Anglo-American view of legal culture, but there are more „legal cultural families“ in the world which should not be left out from the analyzes of the impact of globalization on legal cultures and related challenges. The concluding part of the paper points out various approaches in researching and understanding legal cultures such as different theoretical approaches (determining, essentialist approach or understanding culture as a hybrid, heterogeneous and fluid), different methodological approaches (positivist or hermeneutic and interpretative), different levels of analyzes (within-country and cross-national, or local and global) etc. Nevertheless, various approaches and problems regarding the legal culture as a concept, as well as the research problems which this concept opens up, should not be the reasons for abandoning it; rather the reason for further interdisciplinary studies of legal cultures and its implications on international business.

Keywords: legal culture, uncertainty avoidance, individualism/collectivism, global legal culture.

1. INTRODUCTION

In recent decades, under the influence of the so-called "cultural turn" in the social sciences and the process of globalization, scientific and professional interest has increasingly focused on comparing and understanding the similarities and differences between legal cultures, as well as interpreting the impact that different legal cultures can have on international business, as well as the research of the impact of the globalization on law and legal cultures. Since the cultural turn in the 1980s, thousands of journal articles and books have been published with "law", "culture" or "legal culture" in the title emphasizing the need for cultural study of law, indicating a connection between law and culture and analyzing culture as unavoidable theoretical concept (Silbey, 2010: 470). While analyzing the cultural turn in socio-legal literature Silbey (2010) concludes on the following three important changes. First, research abandoned a "law-first" approach with empirical focus on legal materials and actors and turned "to the everyday life-world of ordinary people" (Silbey, 2010: 473-474). Second, the cultural turn affected the change of research focus from measurable behaviour to analyses on actor's meanings and interpretation of social relations in the field of law (Silbey, 2010). Third, and for this paper the most important change is that the turn to everyday life and cultural meanings of social action also meant turn to "an analytically conceptualized unit of analysis, the researcher's definition of the subject: legal culture" (Silbey, 2010: 474). Another important context for analyzing this topic is the process of globalization. It is a complex process, but we can point out that globalization consists of different dimensions such as economic, cultural, political, legal, informational, technological, etc. (Abercrombie, Hill and Turner, 2008, 113). The economic dimension of globalization includes creating a global market

and free trade, free movement in goods and services, expansion of global financial markets, the spread of neoliberalism, development of multinational companies, the growth of international trade, globalization of production etc. (Abercrombie et al., 2008, 112-113). In such a context, the following question began to be asked frequently: Could free movement in goods and services be “matched by free movement in legal rules”? (Ogus, 1999, 409). Besides, due to the huge growth of multinational organizations and international business, an increased interest in removing cultural barriers in doing business has arisen; therefore more research has been conducted on how to achieve greater or maximum efficiency in management as well as greater business efficiency in an international context. Modern management considers that it is better to understand the local business and cultural environment, because “long-standing cultural habits cannot be changed, nor would it be useful: production and market cycles are relatively short anyway” (Katunarić, 2007, 177). Therefore, efficient business in a global context assumes management based on knowledge of the interaction of different cultural elements in building successful business relationships (Bahtijarević-Šiber, Sikavica and Pološki-Vokić, 2008). Establishing frequent interactions, interdependence and business cooperation between different cultures in order to achieve successful business relationships, raising efficiency and achieving competitiveness in the global market presupposes gaining knowledge and willingness to understand the impact of different dimensions of culture on international business, international trade, organizational behaviour etc. (Bahtijarević-Šiber et al., 2008). In that context, the question of the impact of globalization on legal culture is increasingly being asked in the literature. In this sense, views and approaches differ: first, while according to some authors we can speak of convergence between different legal cultures, others emphasize that such convergence is not possible, and speak of divergence between different legal cultures; second, while according to some authors we can speak of the creation of a global legal culture, others point out that independently of the various globalization influences, national legal cultures continue to differ. Therefore the aim of this paper is to present and analyze the relevant literature to point out some different approaches which analyze that double impact and connection between legal culture and international business: first, the impact of legal culture on international business and second, impact of global international business on legal cultures. However, the concept of legal culture is multilayered, and its definition and conceptualization, the unit(s) of legal culture, use and usefulness of this concept etc., have long been a subject of debate in the socio-legal literature (Nelken, 2016; 2012; 1995; Silbey, 2010). Besides, frequent use of the term legal culture led to conceptual confusion about this term and concept (Nelken, 2016; 2012; 1995; Silbey, 2010). Within the discourse on legal culture Friedman (1994: 119) noticed that legal culture is sometimes recognized as a “legal consciousness”, or “as knowledge and opinion about law”; Silbey (2010: 475-476) found the following four phrases and concepts as alternatives to legal culture: “legal ideology”, “legal consciousness”, “legalities or cultures of legality” and “the structure of legality”; according to Husa (2012: 2), although some authors prefer the term “legal traditions”, there is no important epistemology difference between the concepts of “legal culture” and “legal tradition”; according to Nelken (2016: 46), more alternative concepts could be found, like “law in action”, “legal discourse”, “legal mentalities”, “legal styles” etc. Therefore in the following part of this paper we will start from the definition of the concept of legal culture and different uses of this concept in the socio-legal literature.

2. THE CONCEPT OF LEGAL CULTURE

Lawrence M. Friedman (1969: 34) is the creator of the term “legal culture”, and in his famous article entitled “Legal culture and social development” he has distinguished between the structural (the institutions and their forms and processes), the substantive (the laws, the rules and formal decisions) and the cultural components of the legal system, defining the cultural elements as “the values and attitudes which bind the system together, and which determine the place of the legal system in the culture of the society as a whole”. Those three elements (structural, substantive and cultural) form a legal system, interact with each other and they are influenced by “external or situational factors” from the larger society (Friedman, 1969: 34). According to Friedman (1969: 34-35), the cultural elements in the legal system, or the legal culture, “influence all of the legal system”, and for example, “it is the legal culture, that is, the network of values and attitudes relating to law”, which determines when and why and where people turn to law or government, or turn away”, as well as “which rules work and which do

not, and why“. As Friedman (1969: 35) noted, legal cultures “differ in ways that cut across the conventional similarities and differences of legal systems“. In short, different legal systems and different legal cultures are “part of an eternal dialogue between different ways of looking at the world“ (Friedman, 1969: 36). Besides, legal cultures are “historically shaped and conditioned“ (Varga, 2012, 26). Therefore, law “is not self-contained; it is culturally very specific“, and “some parts of the living law are deeply imbedded in national culture“ (Friedman, 1969: 37-38). Moreover, culture is “the sole source of effectiveness of law“ and important changes in law are not possible unless they are preceded by cultural change (Friedman, 1969: 41). In addition, Friedman distinguishes external and internal legal culture: “external legal culture is the legal culture of the common people; internal legal culture is the legal culture of those members of society who perform specialized legal tasks“ (Friedman, 1975, in: Ravlić and Čehulić, 2020: 150). Although external and internal legal cultures are interconnected and interdependent, in the following chapter of the paper we are focusing on “external“ legal culture. After Friedman’s writing on legal culture, interest and use of the term legal culture is growing, and below we will highlight some more definitions of that term and concept.

According to Vrban (2006: 200-201), legal culture is a multidimensional concept which consists of “legal knowledge“ (common among broad population), “specialized (professional) knowledge“ (common among lawyers and officials), “knowledge of alternative and subsidiary norms“ (which coexist with the official legal system), values as the concept of desirable, and “a legal sense“ or “legal ethos“. Apart from the value of justice, “legal culture exists on a subconscious level as permeation with other values“ that can be displayed in the form of “binary codes: universalism versus particularism, individualism versus communion, rationality versus irrationality“ (Vrban, 2006: 200). Emphasizing the importance of different knowledge and values, this Vrban’s definition of legal culture is in line with similar definitions according to which the notion of legal culture “refers to the attitudes, values and opinions that exist in society in relation to law, the legal system and its various parts“ (Ravlić and Čehulić, 2020: 147). According to Ravlić and Čehulić (2020: 147), parts of legal culture are also parts of “general culture - customs, values, way of acting and thinking - which bind social forces to law or alienate them from it“. Moreover, “every person has a legal culture, just as every person has a general culture, and a social culture“, but at the same time, each person is a “part of collective, a group, a social entity, and shares in the ideas and habits of that group“ (Friedman, 1994, 118). In this regard, according to Friedman (1994: 118), “legal culture is the source of law“, because its norms get transmuted into law and create the legal norms, and it is also, “what determines the impact of legal norms on society“, because subjects of law are the people, “the living human beings with thoughts, ideas, minds, habits, behaviours“ and they react to “orders and institutions of law, and their reactions determine the effect of these orders and institutions“. Friedman (1994: 118) also emphasizes that “legal culture is a kind of *intervening variable*“, because “social forces make law, but they do not make it directly“. Still, legal culture is measurable, it is not a mysterious concept: “we can measure it directly, by asking people questions; or indirectly, by watching what people do and inferring their attitudes from what we see“ (Friedman, 1994, 119). Therefore, in the following part of the paper we will focus on the results of measuring and analyzing values of different legal cultures in terms of their average tendencies¹.

3. CULTURAL DIMENSIONS AND LEGAL CULTURES

In this part of the paper, we will present and analyze some results of Hofstede's research model of "national culture"², that is one of the most famous and globally popular model for studying cultural impact on intercultural cooperation, development, organizations, management, organizational cultures etc. For the purpose of this paper, we will focus on different Hofstede's cultural dimensions in order to emphasize some reflections about different cultural dimensions of “national cultures“ (that is “a country culture“ in his model) and law and legal culture as a part of that culture. Hofstede (2001: 2) defines culture as “collective programming of the mind“, or “software of the mind“, whereby the phrase “mental programming“ is not interpreted literally that people are programmed in the same way as a computer, but it is a theoretical construct by which Hofstede assumes that “each person carries a certain amount of mental programming that is stable over time and leads to the same person’s showing more or less the same behavior in similar situations“. Actually, “every person carries within him – or herself certain patterns of thinking, feeling, and potential acting that were learned throughout lifetime“,

and “much of it has been acquired in early childhood“, when everyone is going through a period of primary socialization (Hofstede and Hofstede, 2005, 2). Culture is therefore relatively permanent and stable; “a collective, not an individual attribute“; “common to some, but not all people“; shared by individuals and groups within society; differs from the other “mental software“; learned in the process of socialization; “not directly visible but manifested in behaviours“; her core is formed by values (Hofstede, 2007, 16). Hofstede (2001) distinguishes five main dimensions on which “national cultures” differ: *power distance, individualism/ collectivism, masculinity/ femininity, uncertainty avoidance* and *long-term/ short-term orientation*, and since 2000s, owing to research by Minkov, a sixth dimension, *indulgence/ restraint* has been added to the model (also known as dimension about happiness) (Hofstede, Hofstede and Minkov, 2010). Thereby, “national cultures” as “statistical combinations” of that dimensions are “unique and unrepeatabe”, and yet closely related to other “national cultures” in the world (Katunarić, 2007, 182). Although all dimensions of culture are important for analyzing the connection between „national cultures“ and international business and cooperation, due to the extensiveness of this topic, we will emphasize only the connotations of some dimensions which are particularly interesting for describing different legal cultures. Therefore, we are focusing on “uncertainty avoidance³” (as the extent to which a culture programs its members to feel either uncomfortable or comfortable in unstructured situations) and “individualism/ collectivism” (as the relationship between the individual and the collectivity that prevails in a given society) as cultural dimensions in Hofstede’s model (Hofstede, 2001).

According to Hofstede and Hofstede (2005: 167), “uncertainty avoidance” dimension (from strong to weak, or from high to low) can be defined as “the extent to which a culture programs its members to feel either uncomfortable or comfortable in unstructured situations“, and “this feeling is, among other things, expressed through nervous stress and in a need for predictability: a need for written and unwritten rules”. In other words, this dimension is used to measure whether the society would rather prefer structured than unstructured situations, where structured situations are those to which the clear rules of behavior can be applied (Hofstede and Soeters, 2002). “Uncertainty avoidance” is the level Hofstede (2001) uses to measure the intensity of feeling threatened by uncertainty, unknown and insecure situations, and the fundamental question of this dimension of culture is how different cultures deal with this uncertainty, or if those vague and unstructured situations cause more or less anxiety in society, while the basic dilemma of this dimension is dealing with the unknown, or dealing with the uncertainties. Thereby, the law as “all formal and informal rules that guide social behavior” is helping us to defend ourselves from the uncertainties in the behavior of others (Hofstede, 2001, 146). The following highlights some of the Hofstede’s theoretical connotations of “uncertainty avoidance” dimension in legislation. Low “uncertainty avoidance” include⁴: “few and general laws and regulations; citizens positive toward legal system; laws usually on my side; rule of law should prevail” (Hofstede, 2001, 180). Furthermore, “if laws cannot be respected they should be changed; fast result in case of appeal to justice” (Hofstede and Hofstede, 2005, 194). High “uncertainty avoidance” include⁵: “many and precise laws and regulations; citizens negative toward legal system; laws usually against me; laws should be broken if unjust” (Hofstede, 2001, 180). Furthermore, “laws are necessary even if they cannot be respected; slow result in case of appeal to justice” (Hofstede and Hofstede, 2005, 194).

In addition, we will emphasize the “individualism/ collectivism” dimension (“I” – consciousness versus “We” consciousness) as the degree to which people in society prefer to act as individuals rather than as members of groups; level of connection, in a way that individualism represents a weak connection between individuals whereby everyone takes care of themselves and their immediate surroundings, while collectivism represents integration into a group and the advantage of group goals over individual ones (Hofstede 2001; Hofstede and Hofstede, 2005). The following highlights some of the Hofstede’s theoretical connotations of the “individualism/ collectivism” dimension in legislation and political systems. Low “individualism” include⁶ that collective interests are “supposed to prevail over individual interest”; economy is based on “collective interests”; “private life is invaded by public interests”; opinions and votes are “predetermined by in-group memberships”; “laws and rights differ by group according to tradition and religion”; “in wealthy countries, low human rights ratings” (Hofstede, 2001, 251). In regard to legal culture, we could also emphasize that collectivist cultures have lower crime rate than individualistic (Hofstede, 2001). High “individualism” include⁷ that individual interests are “supposed to prevail over collective interest”; “economy is based on “individual interests”; “everyone

has a right to privacy”; “everyone is expected to have a private opinion: one person, one vote”; laws and rights are “supposed to be the same for all”; “in wealthy countries, high human rights ratings” (Hofstede, 2001, 251).

Results and theoretical connotations regarding these dimensions are associated with other cross-cultural studies of values and attitudes relating to law and legal culture. For the example, according to Hofstede (2001) countries that have higher “uncertainty avoidance” index will have a greater need for legislation and rules than those with lower “uncertainty avoidance” index. “Uncertainty avoidance” is, among other things, expressed through a need for written and unwritten rules, or in short, strong “uncertainty avoidance” countries tend to have more and more precise laws than in those with weak “uncertainty avoidance” (Hofstede, 2001). According to Hofstede and Hofstede (2005: 190), the effect of “uncertainty avoidance” on a society’s legislation depends also on its degree of “individualism and collectivism”, whereas in strongly uncertainty avoiding and individualist countries, rules will tend to be explicit and written into laws like Hall’s “low-context communication”, while in strongly uncertainty avoiding and collectivist countries, rules are often implicit and rooted in tradition, like Hall’s “high-context communication”. Still, it should be emphasized that no culture exists exclusively at one end of that high - low context continuum (Hall, 1976). For example, Hall (1976) compares some differences in the way the law (more precisely trials) relates to context in different cultures. According to Hall (1976: 107), the “opinion rule” to which “only established facts, stripped of all context in background data, are admissible as evidence” is good example of the “US courts as the epitome of low-context systems”. In contrast, the French courts “allow great leeway in the testimony admitted as evidence” and the court “wants to find out as much as possible about the circumstances behind the surface acts that brought people before the bench” (Hall, 1976, 108). In other words, “the French trial is much higher-context than the United States trial” (Hall, 1976, 109).

According to Hofstede (2001: 174) “uncertainty avoidance” dimension is strongly correlated with some results of the study by Gibson and Caldera (1996) on “The Legal Cultures of Europe”. Gibson and Caldera (1996) investigated “three components of mass legal values-attitudes toward the rule of law, perceptions of the neutrality of law, and the relative valuation attached to individual liberty”. In short, regarding the legal cultures, Gibson and Caldera (1996: 69-70) suggested three major clusters within the EU: the first cluster is formed by Greece, Belgium, Luxembourg, Portugal and East Germany, and “in these countries, regard for the rule of law is not strong, support for individual liberty is weak, and alienation from law is fairly common”; the second cluster is formed by Spain, Italy, France and Ireland, and in these countries, “somewhat mixed views prevail”; the third cluster is formed by Great Britain, West Germany, The Netherlands, and Denmark, and “the people of these countries tend to value individual liberty, to support the rule of law, and to reject the proposition that law is an external, repressive force” (Gibson, Caldera, 1996, 69-70). Comparing these three major clusters with the Hofstede’s results on some dimensions of culture, we can find following common features between them: (1) the first cluster is formed by high “uncertainty avoidance” countries, high and moderate “collectivism”, except of more individualistic Belgium, and high and moderate “hierarchical distance”; (2) the second cluster is formed by high “uncertainty avoidance” countries, except of low “uncertainty avoidance” Ireland, high “individualism”, except of moderately collectivistic Spain, and from low to high “hierarchical distance”; (3) the third cluster is formed by low “uncertainty avoidance” countries, high “individualism”, and low “hierarchical distance” (Hofstede, 2001). Furthermore, Gibson and Caldera have “distinguished two dimensions of legal values: (1) legal alienation (feeling that law is usually against me) and (2) (no) rule of law (okay to break a law I consider unjust)” (Hofstede, 2001, 174). Hofstede (2001: 174) founded that across eleven countries, both legal values are strongly correlated with his “uncertainty avoidance” index ($r=.88$ and $r=.78$). In other words, in high “uncertainty avoidance” countries “people more often felt the law was against them and said it was okay to break an unjust law” (Hofstede, 2001, 174). The third dimension referred to “valuation of liberty (people should not be allowed to express extreme ideas)”, and this was not correlated with “uncertainty avoidance” at all, but was correlated with Hofstede’s “individualism” dimension (Gibson and Caldera, 1996). Namely, Gibson and Caldera (1996: 77) hypothesize that “in more individualistic cultures support for individual liberty is more widespread”, and founded that “individualism and support for liberty do go together ($r=.33$)”. That relation was significant in most countries, with the exception of four countries (Belgium, the UK, Ireland

and Luxemburg), which are located in different clusters, but they have following values in common: “law in support for liberty and high on individualism”(Gibson and Caldera, 1996, 77).

For next example, we will emphasise that Hofstede and Hofstede (2005: 81) founded that Inglehart’s bipolar dimensions (*secular-rational* versus *traditional values*, and *well being or self-expression* versus *survival* values) significantly correlate with their cultural dimensions. More precisely, “secular-rational versus traditional authority was associated with small versus large power distance”, and “well being versus survival was strongly correlated with individualism versus collectivism” (Hofstede and Hofstede, 2005, 81). Besides, in the context of legal cultures, we can emphasize that according to Inglehart and Welzel (2007), self-expression values have a great impact on liberal democracy; emphasize participation in making decisions in economic and political life, emphasize civil and political rights, civil and political freedoms, freedom of choices, individual rights, gender equality, tolerance on foreigners, different minority groups, etc. In this sense, we can also emphasize that according to Inglehart and Welzel (2007: 144), “the degree to which expressive values (or individualism) prevail over the values of survival (or collectivism) reflects the level of socio-economic development of some society”. That conclusion is in line with Hofstede’s conclusions on a high positive correlation between a country’s economic development and individualism as a value system (Hofstede, 1986). Namely, according to Hofstede (1983: 58) individualistic cultures are economically more advanced than collectivist ones, and finds empirical evidence for such a claim in the data according to which in his research on 40 countries and three regions, correlation between the index of individualism and the economic wealth of the country is high ($r = 0.82$). Therefore, richer countries tend to individualism, and poorer ones to collectivism (Hofstede, 1983). Or in other words, individualist cultures actually have a high GNP per capita (Hofstede, 1983). Such conclusions can undoubtedly be criticized, but that goes beyond the subject of this paper.

For an example of the application of the Hofstede’s model we will firstly highlight that Švarc and Lažnjak (2017: 19) conducted research of regional innovation culture in Croatia, and that research is based on the presumption that each of the Hofstede’s cultural dimensions “represent a set of value orientations and norms which influence innovation” and entrepreneurial capacities at the regional level. According to the Hofstede’s theoretical connotations on different dimensions, Švarc and Lažnjak (2017: 144) expected that a higher level of innovativeness and higher levels of economic prosperity and entrepreneurship are related to “higher levels on individualism and masculinity, and lower levels of the remaining four dimensions”. In this regard, we could emphasize “the positive relationship between innovation and uncertainty acceptance”, because “innovative activities imply acceptance of insecurity, tolerance to risk and change” (Švarc and Lažnjak, 2017, 146). Another example is the application of the Hofstede’s model for designing the European management and the possibility of establishing cultural clusters⁸ based on the results of Hofstede’s research with the aim of achieving a competitive advantage of European management in the global market (Bahtijarević-Šiber et al., 2008). Namely, such an idea about the association of European countries is based on the similarity of their cultural dimensions, resulting with the differentiation of the Anglo-Saxon, Germanic, Scandinavian and Latin-Mediterranean cluster (Bahtijarević-Šiber et al., 2008). In addition of this chapter, we will highlight another well-known analysis of legal cultures.

According to sociological or anthropological “law as culture” approach to comparative law, “the concept of legal culture emphasises that law is more than just a set of rules” because “it is also a social practice within a legal community” (Hoecke and Warrington, 1998: 5). Namely, “law and legal practice are one aspect of the culture to which they belong”, or shorter, “legal cultures are part of more general cultures” (Hoecke and Warrington, 1998: 5). Within a “law as culture” approach and from the perspective of the western legal culture, Hoecke and Warrington (1998: 10) distinguished four legal cultures (or legal cultural families) in the world by using the opposites “individualism-collectivism” and “rationalism-irrationalism” as the key concepts: “(a) African culture, (b) Asian culture, (c) Islamic culture” and (d) Western culture (those cultures with European roots – Europe, America, Oceania). By *individualism* they mean “a belief in the autonomy and total liberty of the individual in, and possibly against society” and this “conception is diametrically opposed to the notion of *collectivism* or the idea of the submission of the individual to the community” (Hoecke and Warrington, 1998: 10). Under *rationalism* they mean “a belief in the infinite possibilities available to the human spirit to know, structure and master reality in an objective manner”, and this conception is opposed to *irrationalism*

where the belief is based on sentiments and metaphysical elements (e.g. religion) (Hoecke and Warrington, 1998: 11). In short, according to their analysis: Western legal culture is individualistic and rationalist; Islamic legal culture is less individualistic, and less rationalist than the Western one, while African and Asian legal culture both appear as neither individualistic, nor rationalist (Hoecke and Warrington, 1998: 10-17). While comparing African, Asian, Islamic and Western legal cultures, they conclude that “there appear to be fundamental differences among these cultures as regards the role of law in society and the attitudes of people towards law” which may be analysed on the basis of basic oppositions “individualism-collectivism” and “rationalism-irrationalism” (Hoecke and Warrington, 1998: 43). Besides, Hoecke and Warrington (1998: 29) emphasize that distinctions within same “cultural family” could be drawn (*intra-familial* distinctions) on the basis of their similarities and differences, such as distinction between Latin-American legal systems and North American Common Law, between the common law and civil law countries within Western legal cultures, between the legal systems of EU countries and non EU countries etc. In addition, Hoecke and Warrington (1998: 21-22) conclude, that “(legal) cultures are constantly influencing each other”, particularly under the influence of economic exchanges, global market, the influence of mass media etc. and although we may witness “a slow change in most cultures towards some new common basic culture at a world level”, and legal cultures are constantly interacting and therefore changing, cultural differences “are still too important to be overlooked”, and we still need to explore them and their various “average tendencies”.

4. MODERN OR GLOBAL LEGAL CULTURE

First question is about convergence (leading to unity) and divergence (leading to diversity) between national legal systems as a result of the impact of the globalization and Europeanization on laws and legal systems (Bouthinon-Dumas, 2018; Ogus, 2002; Ogus, 1999; Legrand, 1996). The same question includes legal cultures, as a part of legal systems or in other words as “public attitudes toward law in various countries” (Friedman, 1994, 126). That question is sometimes called as “the convergence issue”, or “the convergence debate”, distinguishing the following two main views: first view emphasizes that “there has been a tendency for legal principles from different jurisdictions to converge” (except in the domain of “moral or religious norms”, e.g. family law); second view emphasizes that such convergence is not possible because there are “real differences emanating from divergent legal cultures” (Ogus, 1999, 405). Following this division, we could also distinguish approaches considering that harmonization of the law, particularly in the international trade, is desirable (with the exception of the moral and religious domain), and approaches considering that “genuine transplantation of concepts from one legal tradition to another is impossible” (e.g. “transplants will be rejected”) or produces “unintended and unwanted consequences” (Ogus, 1999, 405-406; Ogus, 2002, 419). Or in other words, as Varga (2012: 28) emphasize, “the introduction of any new legal solution presupposes a living legal culture in the background”, and the acceptance of such solution, or “its future working will be the function of its socially and culturally sensible interpretation”. Still, we are living in a world and in the age when “considerable efforts are being made to integrate legal systems, particularly in the European Union” for the economic reasons, with economic forces that lie behind that harmonization (Ogus, 2002, 420). Therefore, for the purpose of this paper, in addition we will highlight some of those different socio-legal and economic views regarding to this convergence debate.

In this regard, firstly we will single out some reflections on the contemporary civil law versus common law debate from the sociology of law perspective. Namely, one of the best-known divisions or typologies of law is one that points to two major “families” or “systems” of law in the world: continental European law (civil law, codified law, statutory law) and Anglo-American law (common law, case law or judge-made law) (Vrban, 2006: 195). According to Vrban (2006: 195), these two systems differ according to two basic features: “first, by accepting/ not accepting court decisions as a source of law and second, by the influence or absence of the Roman legal tradition”. Thus, in the common law system, court judgments are an important source of law, while in Europe “court decisions are not in principle recognized as sources of law”, and in contrast, the European continental order is based on the statutes and laws as the main source of law (Vrban, 2006: 195). However, according to Vrban (2006: 195) the usual distinction between English and Romano-Germanic law in the modern development of the law of the EU member states is increasingly fading, so “both in the UK and Ireland, the impact of legislation and

European guidelines as new transnational legislation is increasing, while on the other hand the influence of the courts is increasing on the continent". As examples, Urban (2006) emphasizes the European Court of Human Rights, and the European Court of Justice in Luxembourg, because their decisions are superior to the decisions of member states.

From a comparative law and economics perspective, national legal systems and major legal "families" (common law, civil law etc.), as well as relationships between them are studied in "order to highlight the importance of legal factor in economic development" (Bouthinon-Dumas, 2018: 303). As example, Bouthinon-Dumas (2018) emphasizes the "Doing Business in 2004: Understanding Regulation" World Bank report. Namely, in that and other similar reports World Bank investigates "the scope and manner of regulations that enhance business activity and those that constrain it" (World Bank, 2004: viii). Among other topics, "Doing Business" reports study "improving law and order", while the impact of regulations is measured by their relationship to economic outcomes (World Bank, 2004: x). The underlying ideology of rankings of the most efficient legal systems from an economic point of view (e.g. rankings of the World Bank) is described as follows: first, there is "the idea of an economic superiority of common law over systems of civil law", and second, that idea is related "to the liberal preference for self-regulation or judiciary regulation over the so-called tendency for the countries of civil tradition to intervene in the economy" (Bouthinon-Dumas, 2018: 304). Still, according to Bouthinon-Dumas (2018: 305), fast-growing economies, such as that of China, are "not based on legal frameworks that are usually viewed as conducive to economic development". Therefore, Bouthinon-Dumas (2018:305) emphasizes that the economic attractiveness of laws is not based "on the substance of laws, but also on the legal systems' position in the market". In addition, this author points to the fact that there is no such thing „as a market for legal systems or a law market" (Bouthinon-Dumas, 2018: 313). Namely, by analyzing the convergence of legal systems at first sight, one can conclude that written laws and regulations can be easily changed by political will, so that states can adopt "policies strategically in order to position their law compared to the other legal systems", or shorter, for the purpose of "competitive oriented lawmaking" (Bouthinon-Dumas, 2018: 310). However, if the topic is studied more deeply, one will notice that legal concepts in different legal systems are different in a way that it is difficult, and sometimes even impossible, to translate them into another language and apply in practice⁹ (Bouthinon-Dumas, 2018). Still, this author concludes that for the purpose of economic analysis of the interaction and competition between national legal systems, there are two coexisting strategies: "differentiation strategies feed divergence between legal systems, while alignment strategies constitute a vector of convergence between national legal systems" (Bouthinon-Dumas, 2018: 320-321).

As a contribution to the analysis of tendencies of convergence or divergence between legal systems, Ogus (1999:418) concludes that "competition between jurisdictions will generate a tendency for national legal principles to converge in those areas of law designed primarily to facilitate trade". According to this author, the best examples could be found in "facilitative law", corporate law, contract law etc. (Ogus, 1999; Ogus, 2002). On the other side "there is no reason to expect this phenomenon to apply to interventionist areas of law" because national preferences about the level of protection of defined interests are likely to differ (Ogus, 1999, 418). According to Ogus (1999: 413), this covers tort and regulatory law but also "those aspects of contract, property and corporate law which confer protection on parties assumed to be disadvantaged by processes of free bargaining" (e.g. consumers, employees etc). In terms of distinction between private law and public law, private law is more "deeply entrenched in national legal culture" (Ogus, 1999, 416). In short, according to Ogus (2002:434), forms of alternative culture will be more available "for particular branches of the law", not the law in general. Therefore, Ogus (1999:418) emphasizes that "institutionally led harmonization is weaker" than those who believe that there has been a tendency for legal principles from different jurisdictions to converge, tend to assume. It is also interesting to emphasize that for those economists advocating convergence, traditional or cultural dimensions may be analyzed as factors "that resist the evolution towards efficiency" (Mattei, In: Ogus, 1999, 410).

In addition, we will emphasize some more reflections on why the European legal systems are interacting, but not converging (Legrand, 1996). Namely, according to Legrand (1996) two problems should be singled out. First problem is about rules. This author highlights that the rules are a component of a culture ("collective mental programme"), and that rules are "the outward manifestation of an

implicit structure of attitude and reference”, so they are “a reflection of a given legal culture” (Legrand, 1996, 57). Hence, the rules contain a socio-cultural component or dimension which “remains inherent to rules” (Legrand, 1996, 57). Second, law is social subsystem, therefore “the conception of law as a discrete subsystem of (legal) rules within society, operating independently from society, must be abandoned” (Legrand, 1996, 58). In short, “the legal” cannot be analytically separated from the “non-legal” reality of culture and society (Legrand, 1996, 58). In this regard, Legrand (1996: 60) emphasizes that if we want to understand societies and the legal cultures, we must “move away from rules and concepts and embrace habits and customs”. In other words, when one moves away from rules and concepts, then “it is no longer at all clear that the civil law and common law worlds are converging” (Legrand, 1996, 60). To elaborate this, Lagrande (1996: 62) reminds us that “manners and customs cannot be changed by law, but have to undergo change themselves”¹⁰. This process of changes takes time, and it won’t happen overnight, or simply by some political or economic decision according to which it would be efficient or more competitive to change them for the purpose of unifying or a convergence of legal cultures. Moreover, according to Legrand (1996: 62), a convergence is impossible due to the “fact that the differences between the common law and the civil law *mentalities* at the epistemological level are irreducible”. To elaborate this claim, this author indicates six following examples of epistemological differences between the common law and the civil law: first, *the nature of legal reasoning* (“common law reasoning is analogical, civil law reasoning is institutional”); second, *the significance of systematization* (“the common law was never systematised”, while civil law emphasise systematization); third, *the character of rules* (the common law does not consist of “rules” in the sense of the meaning of rules in civil law); fourth, *the role of facts* (common law emphasise the facts of legal cases, while the civil law emphasise the rules, like the difference between questions put by the courts: “Quid facti?” and “Quid juris?”); fifth, *the meaning of rights* (in English law, someone's rights “are in fact those which are protected by a cause of action”, while in the civil law tradition “the object of legal science is the right, in particular the subjective right”); sixth, *the presence of the past* (“the common law does not have a beginning: it dates from time immemorial”, and in a such a way that the common law is “there”, it was “never made”, it has “only to be found”, therefore it is “established and unchallengeable”, while the civil law has always insisted “upon the concepts of will, command and legislator”, and tended therefore to encourage the idea that “each institution has originated at a particular time in the will of a particular individual who had established it in substantially its present form” (Legrand, 1996, 64-74). Still, Legrand (1996: 78) highlights that he does not represent or encourage some kind of essentialism with its binary logic of conclusions, but emphasizes the need to apply what Edward Said calls “an irreducible subjective core”, while understanding differences between legal systems. In short, the point of such understanding is that “a civilian can never understand the English legal experience *like an English lawyer*” (Legrand, 1996, 78). In this regard, as a contribution to the common law and civil law convergence debate at the European law level, we could also emphasize Varga’s (2012: 100) conclusion that “Europe is far from being a single concept on any axiomatic plane”. Moreover, according to Varga (2012: 100), “it is neither unitary nor coherent”, and it can be expressed more easily as a tendency, sublimating its continued identification through the endless process of mutations”.

Second question in this chapter is also related to this convergence debate, but it is about the possibilities of the creation of the global legal culture. According to Friedman (1994), the creator of the term “legal culture” and probably the creator of the term “modern legal culture”, the globalization of law leads to convergence among systems, and as the modern law is rapidly changing, the legal culture of modern law, or modern legal culture is creating. This is also the legal culture of modern, industrial societies which are constantly changing, or legal culture of western modernity which easily “crosses borders” in the world of globalization, instant communication and fast moving of ideas, news, “ways of thinking and behaving” from one to another society (Friedman, 1994: 119). Besides that, the modern or global legal culture is directed towards the culture of individualism, with special emphasis on human rights (Friedman, 1994). In other words, the basis of modern West legal systems (and therefore the modern West legal culture) is “a profound individualism”, and the individual “is the unit of legal analysis” as opposed to those legal systems who were strongly communal (and the unit of legal analysis was the family, the group etc.) (Friedman, 1994, 125). At the “core of individualism is the notion of right”, or individual rights (Friedman, 1994, 125). Therefore, Friedman (1994: 117) concludes that the

modern legal culture “stresses fundamental human rights and is strongly individualist”. However, such idea may be related to the western legal systems, or Anglo-American view of legal culture, but there are more „legal cultural families“ in the world which should not be left out from the analyzes of the impact of globalization on legal cultures and related challenges, as well as approaches that emphasize the divergence between legal systems and dismiss the possibility of creating a unified global legal culture.

Envisioning how a global legal culture would look like in the future Koch (2003:2) concludes that “this legal culture will initially derive from national legal culture and yet, over time, will transform national legal cultures”. Koch (2003: 3) predicts that global legal culture will be “dominated by some blending of civil law and common law”. Such a prediction is made on the following contemporary data: “33,8% of the world’s jurisdictions, encompassing 55,6% of the world’s population are based upon the civil law model”, while “28,24% of the jurisdictions and 14.68% of the world’s population” are based upon the common law model (Koch, 2003, 2). Together, they cover “over 70% of the world’s population in over 62% of the jurisdictions” (Koch, 2003, 2). In this regard, Koch (2003: 19) emphasizes the E.U. (representing the civil law tradition¹¹) and the U.S. (representing the common law tradition) impact on a global legal culture (as author notes, at least at the early stage of development of global culture). According to Koch (2003: 18), they both have already developed adjudicative bodies for trade and human rights, and that experience will enable them to adjust “a common legal culture in trade and rights” (as author notes, global legal culture in those areas is possible). Then, they both represent liberal democracy: the parliamentary and presidential (Koch, 2003, 21). Besides, Koch (2003: 76) emphasizes the fact that “both are federal in the sense that they represent a union of several sovereigns, and hence their experience with legal unification will serve” them in making the global legal culture. Lastly, they are very influential on both “world culture and the world’s economy”, and that will support their dominance in the future global legal culture (Koch, 2003, 76). However, it needs to be emphasized that Koch (2003: 76) is fully aware of the possibility that other legal cultures, e.g. Islamic (Islamic law covers in some way about a “billion people, nearly 19% of the world’s population or the same as coverage of the common law”), or Hindu legal family (that covers about 450 million people and that is “a greater population than the U.S. or all the E.U. countries combined”), or Chinese, Japanese etc., will also have impact on the development of the global legal culture, but in his reflections (his paper) he didn’t deal with that due to the extensiveness of the topic. In this regard, we should emphasize once again that in this sense the use of the term global culture is not suitable, and that we should rather use the term western modern legal culture, or contemporary Anglo-American legal culture, until such analyses and predictions about global legal culture in the future do not include different “legal cultural families” in the world (so that we can call it global at all).

5. CONCLUSION

This paper has provided a review of how the concept of legal culture has been used in different analyzes of the impact and connection between legal culture and international business. In this regard, some more conclusions could be drawn. Therefore, in the concluding part, we will start from pointing the different meanings of the concept of legal culture that were used in this paper. Namely, as Nelken (2016: 45) summarizes, the term of legal culture is used for a “variety of meanings”, and that includes from “treating it as a variable that explains the turn to law, to exploring law and culture in different settings”. In this sense, he suggests that following three key issues need to be distinguished while analyzing legal cultures: first, “legal culture as fact”; second, “legal culture as approach”, and third, “legal culture as value” (Nelken, 2016, 46-55). Following his division, below we will point out three different uses of the concept of legal culture that we have presented in this paper.

Namely, while analyzing the impact of different cultural dimensions of Hofstede’s model of “national culture” on law, therefore on legal culture we treated this concept as variable (independent and intervening), and used the concept of “legal culture as fact”. In such a way, ideas, values and attitudes belonging to “external legal cultures” can be statistically analyzed, measured, we can compare them etc. By using Hofstede’s model we also treated “nation states” as “units of legal cultures”; it should be emphasized that for Nelken (2016: 48) treating “nation states” as the “unit of legal culture” is problematic. In other words, we assumed that “national cultures” (or “a country culture” in his model)

could be treated as fact. In this regard, we should also emphasize that although Hofstede's analysis of "national cultures" could be the subject of criticism on that account, Hofstede alone criticizes the process of describing the culture in the form of "typical features", and emphasizes that they are "average tendencies". Therefore, with this model we can describe the specific culture in the context of the "average" and "moving equilibrium of various tendencies" (Katunarić 2007, 186). Besides, the value of Hofstede's model should be seen in the conclusions such as that "cultures are more different in the regional than in the national sense" (Katunarić, 2007, 170). In this regard, Hofstede's model has been presented in this paper for illustrating "average tendencies" of values and attitudes that belong and create legal cultures, and the use of this model was presented for examining similarities and differences between legal cultures on different levels of analysis: first, at the level of national legal cultures (or "country cultures"); second, at the macro level analysis; for example, differentiation of the European cultural clusters for the purpose of European management; and third, for micro level of such analysis; for example, research of regional innovation culture in Croatia. Besides, research on the legal cultures of Europe conducted by Gibson and Caldera (1996) included also the analysis of sub-cultural differences in legal values¹², and this research together with research by Hoecke and Warrington (1998), in which they are distinguishing the four legal families, are also examples of using the concept of "legal culture as fact". In addition, while presenting different approaches towards convergence and divergence between national legal systems, and the possibility of creating the modern, global legal culture, we used the concept of "legal culture as value" (Nelken, 2016). In this part of the paper we used the broader notion of legal culture (external and internal). Using the concept of "legal culture as value" was most obvious while we were presenting the convergence approaches according to which "differences in legal culture have market consequences" (Nelken, 2016, 52). In this regard, as example we could emphasize World Bank reports that study "improving law and order", and rankings of the most efficient legal systems from an economic point of view (World Bank, 2004, viii). Another example is Friedman's Anglo-American view on modern legal culture that is directed towards the culture of individualism and with special emphasis on human rights (Friedman, 1994). Besides, while presenting some differences between the common law and civil law legal systems, we used the concept of "legal culture as approach" (Nelken, 2016). It was most obvious while we were presenting the examples of epistemological differences between the common and civil law legal systems (differences in legal reasoning, meaning of rules, the role of facts etc) (Legrand, 1996).

In order to summarize various approaches in researching and understanding legal cultures, in addition we will point out some main issues concerning different theoretical and methodological approaches, as well as different levels of analysis. Firstly we will point out different theoretical approaches to legal cultures. This could be presented as difference between determining, essentialist approaches to legal culture (in which legal culture is seen as unique, homogeneous, closed, static, territorialized, national, constrains "individual choices" etc.), and approaches that arise from "cultural turn" and "interpretative turn" in which culture is seen as "an endless interpretation of interpretations", as diverse, hybrid, heterogeneous, open, fluid, dynamic, de-territorialized, transnational etc. (Nelken, 2012, 15-20). Secondly, we will point out different methodological approaches to legal cultures. This could be presented as difference between positivistic, quantitative approaches, and hermeneutic and interpretative, qualitative approaches. This could also be described as "explanation or interpretation" question (Nelken, 2012, 32-34; Nelken, 1995, 441-443). Thirdly, we will point out different levels of analysis. In this regard, it is necessary to distinguish intra-cultural or within-country analysis from cross-national or cross-cultural comparison of legal cultures. Besides, we can also add a distinction between global and local legal culture, which corresponds to the distinction between globalization and localization as parallel processes. Namely, for the purpose of this paper we have presented some reflections on creating a global legal culture, but it should also be emphasized that frequent contacts between cultures often "stimulates cultural diversity by confirming group members in their own identity" (Hofstede, In: Legrand, 1996, 80). For example, according to Legrand (1996: 80), with linking the common law and civil law legal systems, the European Community has also emphasized their diversity, and has made "possible a new awareness of differences (or 'otherness')". Therefore, as Nelken (1995: 438) emphasizes, the real question is about boundaries of legal cultures. Namely, according to Nelken (1995: 438), "our focus can range from the World system" (in Wallerstein's terms), to the "nation state", the "families of legal systems", the "third cultures" (in Featherstone's terms) of

“international trade, communication networks or transnational processes associated with globalization or other developments”, global culture, regional culture, local culture (as for example “the culture of local courts”) etc. Nevertheless, various approaches and problems regarding the legal culture as a concept, as well as the research problems which this concept opens up, should not be the reasons for abandoning it, rather the reason for developing further interdisciplinary knowledge about legal cultures, and due to topic of this paper, further studies of its various implications on international business.

ENDNOTES

- [1] In this regard, Friedman (1994: 120) emphasis that legal culture is like general culture, “a body of ideas, values and attitudes”, and that when we talk about the legal culture of some community, this does not mean that “that everybody share the same ideas”, what we refer to are “patterns, tendencies, trends”.
- [2] According to Švarc and Lažnjak (2017: 21), there are “big five” theories of national cultures, “those of Hofstede, Schwartz, House (GLOBE project), Hampden-Turner and Trompenaars and Inglehart”. For more on their theories of national cultures and respective dimensions, see pp. 70-119.
- [3] Hofstede’s theoretical connotations regarding the “uncertainty avoidance” dimension in connection to law and legal cultures have been described and analyzed in previously published paper (Jeknić, 2016, 796-803).
- [4] The most weak UA countries from the Hofstede’s IBM database were Hong Kong, Sweden, Denmark, Jamaica, Singapore etc. (Hofstede, Hofstede, 2005, 169).
- [5] The most strong UA countries from the Hofstede’s IBM database were Greece, Portugal, Guatemala, Uruguay, Belgium, Salvador, Japan etc. (Hofstede, Hofstede, 2005, 168).
- [6] The most low “individualism” countries from the Hofstede’s IBM database were Guatemala, Ecuador, Panama, Venezuela, Colombia, Pakistan, Indonesia etc. (Hofstede, Hofstede, 2005, 79).
- [7] The most high “individualism” countries from the Hofstede’s IBM database were United States, Australia, Great Britain, Canada, Hungary, Netherlands, New Zealand etc. (Hofstede, Hofstede, 2005, 78).
- [8] For example, result of Hofstede’s (1983: 69) cluster analysis is the distinction of thirteen clusters of national cultures according to four cultural dimensions.
- [9] As example, Bouthinon-Dumas (2018: 315) emphasizes that “the concept of remedies has no equivalent in the French language”, pointing to the divergence between the English common law and the French civil law tradition.
- [10] Namely, “societies ... have ways of conserving and passing on mental programs from generation to generation with an obstinacy which many people tend to underestimate” (Hofstede, In: Legrand, 1996, 62). As Legrand (1996: 62) concludes, “only later can the laws and institutions of a nation, through experience, learning and reason; be accommodated to the new manners and customs”, and this process takes time.
- [11] For example, codes in civil law tradition perform a “unifying function”, and that could be attractive to the global legal culture because globalization leads towards unification, and a “code is an effective technique for centralization” (Koch, 2003, 30).
- [12] Gibson and Caldera (1996: 71-79) founded that level of education and social class have a significant impact on legal values, while ideology, gender, age or religion did not proved to be statically significant (“those who are more educated tend to support the rule of law more, favor individual liberty more and believe in the neutrality of law”, just as opposite to values of the working class in their research).

Abstract: Demographic dynamics, growing pressures from new tech or challenges from the pandemic Covid–19 and the consequences represent just some of the concerns on food safety in the markets in 2021. Socio–economic developments of recent years and changes in the structure of consumption, can also affect the level of food safety in local markets in the city of Tirana, in Albania. Verification of the thesis of the impact of socio–economic factors on food safety, represents a trilemma of interest especially between the factors of consumption, education and the religiousness. The paper’s objective is an evaluation impact of the factors such as: age, safety knowledge, gender, consumption quantity, domestic tomato consumption, imported tomato consumption, greenhouses tomato consumption, field tomato consumption, Muslim religiousness, Christian religiousness to the food safety of vegetables, by illustrating with a case study from the agri–food markets in Tirana. The results of the statistical model used shows that variables safety knowledge, domestic tomato consumption, greenhouse tomato consumption, imported tomato consumption, field tomato consumption, primary education, middle and university education affect very significantly up to significantly to food safety. The findings can serve especially to professionals and future studies and also to the food agencies and market actors.

Key words: food safety, safety knowledge, consumption, education, religiousness, Albania.

1. Introduction

Demographic dynamics, growing pressures from new technologies or challenges from the Covid–19 disease, and the consequences represent just some of the concerns for food market security in 2021. The mobility of the young and highly qualified population abroad, as everywhere even in Albania, has brought implications for families, with consequences for income stability and growth. Interaction with major factors, such as climate change, technological and e-commerce transformations, e-services etc., food production through 3D technology and the industrial massification of their production, have further increased the complexity of concerns over the production, consumption and food security, exposing more to these potential and still unstudied consequences small and unintegrated markets. The issue of food security has always been a major public agenda for researchers and policymaking, but currently this issue has become particularly primary and challenging due to the unpredictability of the situation created everywhere by the Covid–19 pandemic and the consequences for the stability of the economic system, functioning of markets and the trade, production and sustainable consumption.

The consequences of the Covid–19 pandemic, socio–economic developments and new demographic trends have had their impact on the functioning of markets and the issue of food safety in Albania. In the agri–food markets of the city of Tirana, several times there have been concerns which have identified the problem of production standards, product quality and their food safety. Given that a significant part of the food supply is provided through domestic agricultural production, the problems identified among vegetable agricultural products have raised concerns about their food security as an issue that affects the consumer and the functioning of markets on the one hand, as well as domestic producers, their competitiveness, exports and imports on the other hand. From this point of view, a research on the possible impact of some key socio–economic factors on food safety in the food markets of the city of Tirana is reasonable and represents a thesis of interest to better understand the problem in terms of factors by further offering possible adjustments needed for improvement.

Recent socio-economic dynamics and changes in the structure of consumption in the city of Tirana, can also affect the level of food safety in local markets. Food safety is related to factors such as age, gender, including level of education or safety knowledge, but can also be influenced by consumption and the religiousness. A perspective between the main categories of vegetable consumption, such as domestic production, imported, produced in greenhouses and field production and the quantity of consumption along with demographics as well as factors of safety knowledge and religiousness towards food safety can provide a more specific overview on this issue. The analysis of the above factors can contribute especially to: (1) consumer protection agencies and institutions, (2) market institutions and participants, as well as (3) local agricultural producers, given the fact that food safety from recent decades has been seen as well as a market sub-policy; or expressive of the competitive advantage of producers. The study investigates the impact of factors such as age, safety knowledge, gender, consumption quantity, domestic tomato consumption, imported tomato consumption, greenhouses tomato consumption, field tomato consumption, Muslim religiousness, Christian religiousness to food safety in the food markets of the city of Tirana in Albania. Annual studies on the impact of the socio-economic factors to the food safety are lacking and the verification of the above thesis or possible trilemma for more consumption, education or religiousness towards food safety represents a topic of research interest and may serve to the field professionals for further studies.

Researchers have dealt with the impact of changing socio-economic factors to food safety. The age is a strong predictor of perceptions on food-related health risks and food safety¹. Persons at least 40 years old reports safer food patterns². The lack of food safety knowledge affect to food safety³. Consumers safety knowledge affect to food safety⁴. The most concerned on food safety tend to be woman⁵. Gender is an important predictor of perceived food safety⁶. Food consumption quantity affect in different ways to the food safety between EU countries⁷. Rising of food consumption quantity has raised concerns about over-applications pesticides and chemical contaminants and their impact on food safety in China⁸. Increasing consumption and demand for domestic vegetables in Vietnam has caused state failure in food safety protection⁹. Over the last decade great attention has been paid to food safety due to the increases of demand for domestic food products which has caused increase of diseases by chemical residues¹⁰. The rise of more than triple of food imports value from China has raised public concerns to

food safety in the US¹¹. U.S. agricultural imports have increased significantly in recent years and several recent incidents have raised concerns about food safety¹². The rapid growth of greenhouses vegetable production has raised attention to consumption and food safety¹³. Dietary exposure of heavy metals through vegetable consumption produced in greenhouses has been identified as a potential risk to human health and food safety¹⁴. Disease outbreaks originating from fresh field agricultural produce are a major concern for public health and food safety by causing foodborne illnesses (46%) and hospitalizations (38%) in the US¹⁵. The continuous rise in the number of outbreaks of foodborne illness linked to fresh field vegetables is related with the enteric pathogens on plants represents a complicated challenge to food safety¹⁶. Consumers representative of Muslim religiousness are inclined to consume brand food products rather than others due to perception as suitable for food safety standards and intended to advance their well-being¹⁷. Based on their trustworthiness and food quality and safety specific logo foods are regarded by consumers of Muslim religiousness as one of the healthy food available in the markets¹⁸. Studies find positive links between Christian religiousness of persons and tendencies for a nutritious diet associated with quality “healthy nutrition” and food safety factors¹⁹. There is a positive connection of safe and nutritious food diets which contributes greatly to the good health and nutritional status among the representatives of the Christian religiousness in the area of Crete compared to others²⁰. Preparation of skilled students during primary education for comprehending microorganisms and their pathogenic effects is of crucial importance on the consumer level and food safety²¹. Primary educational level is one of the demographic factors that influence on low knowledge of consumers concerning food safety²². Studies revealed that students were lacking in food safety knowledge by practiced some risky food-handling behaviors and the middle school students

offer an ideal target group for food safety efforts²³. There is a need of actions on adolescents groups at the middle education level by considering influence to food safety²⁴. Observations on students attending college suggest that students continued to use risky practices and the risks of food safety remain²⁵. A study among college students in China confirm a optimistic bias on food safety issues, based on recommendations were made to increase public awareness affecting to food safety²⁶. University students knowledge and behaviours affect to food safety²⁷. Studies have noted shortcomings in food safety behaviour among university students by resulting on wider implications to food safety issue and its problematic²⁸.

2. Objectives and hypotheses

The objective of the paper is to evaluate the impact of several factors of a socio-economic nature such as the age, safety knowledge, gender, consumption quantity, domestic tomato consumption, imported tomato consumption, greenhouse tomato consumption, field tomato consumption, Muslim religiousness, Christian religiousness to the food safety of vegetables (the case of tomatoes) in the agricultural food markets of the city of Tirana in Albania.

- The study hypotheses are:
- H1 — the age of consumers affects food safety;
- H2 — safety knowledge of consumers affects food safety;
- H3 — consumers gender affects food safety;
- H4 — consumption quantity affects food safety;
- H5 — domestic tomato consumption affects food safety;
- H6 — imported tomato consumption affects food safety;
- H7 — greenhouses tomato consumption affects food safety;
- H8 — field tomato consumption affects food safety;
- H9 — Muslim religiousness of consumers affects food safety;
- H10 — Christian religiousness of consumers affects food safety;

Considering the importance of the education factor under the influence of new demographic dynamics a question of research interest is also formulated. Does education according to degrees: (1) primary, (2) secondary, (3) college/institute, and (4) university affects food safety?

The above variables have been tested through interviewing, and they are: age; safety knowledge; gender; consumption quantity; domestic tomato consumption; imported tomato consumption; greenhouse tomato consumption; field tomato consumption; Muslim religiousness; Christian religiousness, primary education; middle education; college education; and university education.

3. Measurement procedure

A questionnaire was construct to perform a quantitative measurement and provide an extensive database which was further used in the study area (220 interviews) by random selection. The variables are measured by scales (1–5) and consumers have been responded to the questions. Based on data provided a statistical model is used. The significance of the variables is presented by table 1.

4. Conclusions and discussions

The paper in accordance with the objective of the study investigates the impact of the above variables to food safety in the agri–food markets of Tirana, Albania. Age, gender, consumption quantity, Muslim religiousness, Christian religiousness and college education are factors which do not impact to food safety (table 1). The perception on food safety issues has no differences between demographic factors. Consumers representing the Muslim and Christian religiousness’s despite differences do not affect food safety and this is an important finding for policymaking. The college level education affect in different way food safety compared to other levels of education. Given the average age and low presence of the respondents of college education, the fact that does not affect to the food safety compared to others (primary, middle and university educ.) may be related to self–identification (of age 50+), where respondents with Higher education can be identified more with the university than the colleges level degree. This can be explained as a simple routine reaction of self–identification of the interviewees or a matter of self–confidence and it may deserves further studies.

Safety knowledge, domestic tomato consumption, greenhouse tomato consumption, imported tomato consumption, field tomato consumption, primary education, middle and university education affect very significantly up to significantly to food safety (table 1). The safety knowledge affects very significantly to food safety and this implies the importance of training and actions to be taken in the long–proactive way to spread the knowledge and culture of food safety. Consumption of domestic vegetables (tomatoes) and consumption of vegetables from greenhouses affect very significantly food safety. In a sense these two categories may even overlap, given that the greenhouses tomato has a longer presence in the markets than field production, and the positive attitude of consumers also implies continuous improvements in production safety standards. Imported tomatoes and tomato field produced also affect very significantly food safety but are negatively related. This finding can justified by consumers unsafe perception f for these categories and it deserves attention. Studies support the low level of food safety of the field vegetables due to the presence of pathogens as E.coli29 or listeria, salmonella, etc. and we have submitted also during the literature review. Primary education affect very significantly to food safety, while the middle and university education affect significantly and also are related negatively. There seems to be a reactive and further more proactive perception among the consumers according the levels from the primary to middle and university education to the food safety and negatively related. Specific education on culture and food safety knowledge and actions increasing credibility of actors in the market regardless of demographic/religiousness factors are recommended measures for professionals dealing with local markets. Education actions are effective in changing attitudes practices and personal relationships on food safety and culture³⁰. Actions on contemporary safety knowledge would bring closer the actors in the chain wholesalers–retailers–consumers, increasing the reliability as a key issue to food safety.

Abstract: Consumption of domestic food products is important for the economy everywhere. Concerns about this activity create implications for (1) growth, (2) farmers' income and (3) the markets functioning. Studies on the consumption of local products in the market of Tirana in Albania in the light of new development dynamics are lacking. The paper's objective is an evaluation of factors such as the age, food safety, education, consumption quantity, income, price preference, family members, status of employment represented by workers and consumers safety knowledge to the consumption of domestic agricultural products in the markets of Tirana, Albania. The results of the statistical model used shows that variables age, consumption quantity, price preference, food safety and social status of interviewers represented by workers affect significantly to very significantly to the consumption of domestic products. Findings appeal for attention on the issue offering possible ways for improvement.

Key words: Consumption of domestic vegetables, food safety, price preference, workers, Albania.

1. Introduction

Consumption issues in developing countries are very specific and still unexplored. Nowadays the growing influence of technologies or even the consequences of the Covid-19 pandemic have increased research curiosity on the problem of consumption. Among this wide range of issues, the implications for the consumption of domestic products have been and remain a preferential subject among researchers and of particular interest to economies with low access to resources and factors. The consumption of domestic products is an important source (1) of economic growth, (2) income of farmers' producers and (3) the functioning of markets. In the markets of Tirana several times have been evidenced reclaims (photo 1), raising concerns over the consumption of domestic produce and the income of farmers' producers. Given these developments a study on the factors that affect the consumption of domestic products may be of interest, throwing more light in this regard.

Photo 1. Tomato problems in the market of Tirana.

Source: agroweb.org.

The consumption of domestic products is influenced by economic and social developments. Overseas labor movements and their effects on factors can affect the consumption of domestic production in several ways. The focus of this paper is an assessment of factors: age, food safety, consumption quantity, income, price preference, number of family members, status of employment and safety knowledge to the consumption of domestic products in the markets of the city of Tirana, Albania. Measurements on the consumption of local food products in the case of Tirana markets are missing. More research in this area can contribute to the identification of problems and respective adjustments, by sensitized also for more attention about its importance from policy practitioners or professionals.

About variables under consideration has a broad support literature. The age effect on domestic consumption and a number of studies reports very similar effects for different age ranges¹. The age composition affect strongly to the domestic consumption². The consumption level of specific foods is influenced by future changes in food safety³. Food safety is emerging as an attribute demanded by consumers⁴. Findings show that the quantity consumption by households play a significant role in explaining variations in consumption⁵. Household characteristics expressing possession and utilization of consuming affect to overall consumption⁶. Demand for food consumption is a function of capita income⁷. The increase of incomes in developing countries has influenced the increase on the demand for food consumption⁸. Price preference affect to foods consume⁹. Price preferences affect to the food consumption and especially on soft drink case¹⁰. Family size expressed by members hypothesized to influence on food consumption¹¹. Multi-member household model affect to food consumption¹². Workers tend to consume more during time-work to socialize with other colleagues¹³. The labor status

impacts the structure of food consumption¹⁴. Food-handling practices and safety knowledge affect to consumption¹⁵. Adolescents' food consumption affected by knowledge safety¹⁶.

2. Objectives and hypotheses

The objective of this paper is to evaluate significance of some variables such as the age, food safety, consumption quantity, income, price preference, family members, consumers' status of workers and safety knowledge to the consumption of domestic vegetable products, illustrating with a case study on consumers preferences to domestic tomatoes in the agri-food markets of Tirana in Albania.

The study hypotheses are:

- H1 — the age of consumers affects to the consumption of domestic tomato;
- H2 — perception on food safety of consumers affects to the consumption of domestic tomato;
- H3 — consumption quantity by consumers affects to the consumption of domestic tomato;
- H4 — income level of consumers affects to the consumption of domestic tomato;
- H5 — price preference of consumers affects to the consumption of domestic tomato;
- H6 — family members of consumers affects to the consumption of domestic tomato;
- H7 — consumers status of workers affects to the consumption of domestic tomato;
- H8 — safety knowledge of consumers affects to the consumption of domestic tomato;

The above variables are measured by an interviewing procedure in the markets of Tirana, Albania and they are: age; food safety; education; consumption quantity; income; price preference; family members; workers; and safety knowledge.

3. Measurement procedure

A questionnaire was used to conduct the study in order to provide a large database in the study area (the agri-food markets of Tirana), by random choice procedures and interviewing face to face (220). The variables are measured by an increasing scales (1–5) according to the respective questions.

Based on data provided has become an overview of preferences for domestic tomato consumption as follows (table 1; figure 1).

Table 1. Preference for domestic tomato consumption.

4. Conclusions and discussions

Paper provides an overview on discussions about the problems of consumption of domestic products, by referring a case study of the vegetable consumption in the city of Tirana. Variables income, family members, safety knowledge and education do not effect on the domestic vegetable consumption.

Individuals, regardless of income, family size, education, etc., tend consumption of the domestic products. A number of complex factors with interdisciplinary scope interact on the consumption of domestic products. Consumption of domestic products is a myth and very popular in every country. This can be explained by the fact that consumer choice is not based much on the process of critical thinking and rational behavior and here interact also other factors, such as ethnocentrism and feelings of patriotism. Consumers' ethnocentrism and patriotism are stronger determinants of domestic consumption than rational considerations (the cognitive mechanism)¹⁷.

Age, consumption quantity, price preference impact and very significantly (table 2) to the domestic vegetable consumption. The increase in consumption quantity affects the decrease in the consumption of domestic products. Consumers may find of interest products of other origin, or even other competing vegetables (except tomatoes) and this trend deserves further attention. With age, individuals tend to consume more domestic production and this is an important finding for consumption in the markets of Tirana, given the new demographic dynamics. Price preference is an influential factor to consumption. One of the characteristics of domestic production is its presence in the markets throughout the year and this is related not only to the production of the field but also to the fact that a dominant part of the annual supply is provided by greenhouses where the country has known advantages. Considering the size of the offer of domestic production from greenhouses, high prices during the cold seasons, but also strong price amplitudes during the year, adjustments in agri-food markets and fair prices are necessary to stimulate the consumption of domestic products.

Food safety and social status of interviewers represented by workers are also very influential factors to the consumption of domestic products. We explained that the consumption of domestic production is popular regardless of social status. Workers are driven by nationalist consumer tendencies and increasing their market presence increases the tendencies for increasing consumption. Food safety impact significantly for increasing of consumption. Eating is a behavior, this implies an interaction and food safety in some cases appears as a factor and attribute. Food safety and food concerns in the century XXI are exclusivities of scientific expertise. Along with other reclaims of domestic production in the market, the vivipary phenomenon e.g. (photo 1) a very rare phenomenon does not have to be so frequent and unaddressed. The range of factors that can affect this problem is very wide, including environmental factors, etc. up to the genetic problems of the varieties used, etc., etc. This is not a myth: this is a truth that requires solutions from the responsible institutions.

Abstract: The increasing speed of change and social effects as a result of new technologies and the spread of information represent a phenomenon that everywhere has modified the functioning of the economy and consumption. A study on the impact of socio–economic factors on decisions on the consumption of imported vegetables by the citizens of Tirana in the context of these new dynamics is a topic of research interest. Agarwala et al. (1972), argue impact of socio–economic factors to the consumption. The paper’s objective is a measurement impact of socio–economic factors such as age, food safety, purchasing quantity, income, price preference, number of family members and status of employment represented by workers to the consumption of imported agricultural products in the markets of Tirana, Albania. The results of the statistical linear model used shows that variables age, price preference and purchasing quantity not affects to the consumption of imported vegetables, while income, food safety, the employment status represented by the workers and the number of family members are influential factors. Findings show an interaction of socio–economic phenomena to consumption.

Key words: Consumption, income, price preference, workers, imported vegetables, Albania.

1. Introduction

The dynamics of developments during the last 2 decades in Albania has caused transformative infrastructural, economic and social developments. However, rapid urban migration from rural and sub-urban areas in recent years has been replaced by youth emigration and most qualified abroad, expanding the heterogeneity of challenges and bringing under a status–quo sustainable development. Moreover, the increasing speed of change and the social effects as a result of new technologies and the spread of information have shown an impact everywhere and especially on production and consumption. These dynamics have rapidly modified the functioning of the economy and markets by prompting new ideas and formulations for adaptation. The job mobility and human capital or the rapid expansion of e–commerce (also from the Covid–19 pandemic), e–payments, e–services, etc. and the functioning of markets are part of the contemporary debate, which has stimulated research interest everywhere on the impact of socio–economic changes on consumption factors generally.

Increasing the speed of change specifically requires attention in the case of the functioning of food markets, given the importance for production, consumption and the need for adequate–fast responses. In the food markets of the city of Tirana in recent years have been discussions on food safety and sales domestic products. This situation has increased the general disadvantages of domestic products, leading to a declining perception of consumers. The discussion on identifying the influential factors in the structure of consumers demand in the conditions of major socio–economic changes is of key importance to recognize the consumption trends of imported products, adjustments and possible adaptations in food markets of Tirana and lessons also for domestic production. The measurement of factors such as age, food safety and income, purchasing quantity, price preferences, family members and employment status to the consumption of imported products may help for a wider understanding.

While a comprehensive sensitization on sustainable consumption is more important for the sustainability of the economic system and the well–functioning of markets; an overview of the factors influencing the consumption of imported food products may be a more call for policy practitioners.

Moreover, considering the new socio-economic dynamics and the speed of change as a result of increased mobility and the spread of information on a an assessment of the above factors may be useful for (1) market actors, including domestic producers, (2) food market monitoring institutions, and also serving as an information manual for (3) the consumer protection associations. Such a studies on the consumption of imported vegetables in markets of Tirana and the impact of changes in socio-economic factors such as age, food safety, income, purchasing quantity, price preferences, number of family members, and employment status are missing and may be a topics of interest.

Many researchers see socio-economic factors and their possible changes in interaction with changes in consumption. The consumer parameters are strongly influenced by socio-economic factors¹. The age significantly affect the decision to consume². An older family member usually consumes less than does a young family member³. Food safety in developing countries is facing a particularly transformative period due to the link with increased demand for food and consumption⁴. Food consumption in European countries is affected by exposure to hazardous chemicals present in seasonal foods and food safety⁵. Purchases food quantity affect to consumption⁶. Agricultural economists generally agree that economic development which also implies the higher purchases quantity stimulate the expansion of consumption⁷. Income variable accounted for most of the variability in consumption⁸. By Friedman, when a consumer unit experiences an increment of income this component is added to its assets in the form of consumption⁹. Paul Samuelson emphasizes that the economic theory of consumer's behaviour it is largely built up on the notion of "revealed preference" based on costs and preferential price of goods¹⁰. Price preferences broadcasted to consumers through new technologies such as mobile app affect to consumption¹¹. Changes in family members consumption habits its related with family

decision-making in consumption¹². In the center of shopping theory is analysis of consumption and idea that everyone and every day obtain goods also for other people as a driving force behind our responsibilities to provide others and within a family often it is used as an example of everyday moral practice¹³. By Keynes' in its General Theory, the consumption is related to the level of employment¹⁴. While the implications of changes in consumption patterns are complex, the case studies show that the consumption as a socio-economic phenomenon can be understood as a performance of consumer identity rather than a 'mere' worker¹⁵.

2. Objectives and hypotheses

The objective of the paper is to provide an assessment of some factors of economic-social nature such as the age, food safety, purchasing quantity, income, price preference, family members and the status of employment represented by workers to the consumption of imported agri-products in the in the agri-food markets of the city of Tirana.

The study hypotheses are:

- H1 — the age of consumers affects to the imported tomato consumption;
- H2 — perception on food safety of consumers affects to the imported tomato consumption;
- H3 — purchasing quantity by consumers affects to the imported tomato consumption;
- H4 — income level of consumers affects to the imported tomato consumption;
- H5 — price preference of consumers affects to the imported tomato consumption;
- H6 — family status of consumers by members affects to the imported tomato consumption;
- H7 — consumers employment represented by status of workers affects to the imported tomato consumption;

The above variables are measured through interviewing in Tirana food markets during the period October 2019 – January 2020 and they are:

- Age;
- Food safety
- Purchasing quantity
- Income
- Price preference
- Family members
- Workers

3. Measurement procedure

A questionnaire was construct to provide a broad database and after testing in a focus group with some adjustments it was used in the study area (the agricultural–food markets in the municipality of Tirana), by interviewing consumers (220) by random choice procedures. The variables are measured by scales (1–5) and interviewed consumers have been responded to the respective questions.

Based on data provided a statistical model is used to test the above variables. The significance of the variables is presented in the following table (table 1).

Table 1. The significance of variables by linear statistical model.

Dependent variable: Imported tomato consumption					
	<i>Coefficient</i>	<i>Std. Error</i>	<i>t-ratio</i>	<i>p-value</i>

4. Conclusions and discussions

The paper provides an analytical overview with focus on food consumption of imported vegetables and the socio-economic factors that affects to consumption, according to consumers perception in the markets of agricultural–food products in the city of Tirana, Albania.

The age, price preference and purchasing quantity, are factors which do not have an impact on the consumption of imported tomatoes. Imported tomatoes have a high presence in the markets mainly during the cold seasons. During the spring–summer season it competes from domestic tomato produced in the field, which has precedence due to price. Imported tomatoes have a stable and competitive offer during the autumn–winter season and compared to large fluctuations in domestic production prices during the seasons it fluctuates very little in price. The stabilized price affects the stabilized demand in the market and this may explain why the quantity of purchases (approximately a constant) does not affect consumption. In the categories that prefer this product there seems to be a consensus between consumers without the influence of age and preferential price to consume imported tomatoes, proving that this product has a reputation. The number of family members is an influential factor in consumption and this is related to the pattern of family consumption and the fact that vegetables represent a useful food diet in Albanian families. Higher consumption of vegetables affected by lifestyle, making that people who live together in families tend more to the consumption of vegetables than others and this goes hand in hand with the way it is hypothesized. While families with a higher number of members or cohabiting individuals affect the consumption rates of imported tomatoes, age, price preference and purchasing quantity are factors that do not affect.

The food safety and employment status represented by workers have a high impact and are negatively related to consumption. With increasing food safety the trends are to reduce the consumption of

imported tomatoes. We pointed out that imported tomatoes are generally characterized by a stable price and this goes along with a stable performance in terms of production standards, commercial appearance and food safety in the market. Increasing perception on food safety means increasing information and civic awareness on safe food and this is generally accompanied by an increase in the critical mentality of citizens and eventually increasing skepticism. Surveys among EU countries highlight the critical approach and the degree of distrust in the products of daily food consumption despite the high standards of food safety. The fact that the increase in perception on food safety of imported products has a very significant impact on the decline in their consumption may be related to consumer confidence in more competitive alternatives such as domestic production, for example. It is a well-known fact that imported tomatoes produced in greenhouses have a high content of heavy metals (Cd, etc.) and this finding deserves more attention. The employment status represented by consumers employed as workers has a very significant impact on consumption: with the increase of consumer-workers, also increases the possibilities to reduce the consumption of imported tomatoes in the markets of Tirana. Moreover, the consumption of imported products seems to correspond to the social status of consumers. Among workers, the consumption of imported vegetables may be an impossible myth, influenced by economic factors of income and food diets inaccessible to them and/or cultural factors related to the use of imported vegetables on annual basis. Consumption inequality affects sustainable consumption, social cohesion and sustainable development. The development of an employment oriented towards university work and industrial activities with high returns, is a priority argument for sustainable production and consumption.

Income has a very significant and positive impact on consumption. In fact the income variable is very important to consumption and this goes hand in hand with the way it is hypothesized. The literature broadly supports the impact of income factor on consumption in developing countries. Moreover, for the same increase in the level of income between the high-income countries (HIC) the low-income and the middle-income countries (LIC, MIC), the differences in consumption follows respectively different trends. This affects to the daily turnovers and especially consumption and demand for food. The level of income in the countries with the lowest incomes deprives many groups-categories of basic means of consumption. In lower income countries (LIC, MIC) to provide basic food items need on average 3/5 to 4/5 of working days realized during 1 month and in this context income represents a critical factor for food consumption. The impact of the income to consumption represents a finding that is supported by previous studies conducted in Albania.

Abstract: In recent years farmers producers of vegetables in greenhouses of Albania have faced a number of problems within this cluster such as production standards, costs and sales. The decline in sales is related to domestic consumption; the facts from the markets of Tirana, support that the consumption of domestic products may not yet be a priority of consumers. The decline in consumption of domestic products affects farmers' incomes and the well-functioning of markets. Consumption of domestic vegetables produced in greenhouses can be affected by demand factors, including age, perception on food safety and consumers' education. The literature supports impact of the above factors to the consumption. The paper's objective is a measurement of the potential impact of variables such as age, food safety, consumers' education and family members to the consumption of domestic products in the markets of Tirana. The results of the statistical model used shows that above variables affects to the consumption. The findings provide a socio-demographic profile of the consumer of domestic agricultural products produced in greenhouses and may serve for other future researchers.

Key words: Consumption, age, food safety, education, family members, domestic production.

1. Introduction

The production of vegetables in greenhouses represents an important industry for Albanian agriculture. Over the last 30 years this activity has expanded and mainly in the south-western area, which represents the largest agricultural production region in the country. Between the years 2000–2016 the surface of greenhouses in Albania has expanded by 462ha–1403ha¹. Greenhouse farmers favored by annual temperatures and the advantages of specialization for years, have the capacity to produce 3 agricultural crops during 1 calendar year. However, in recent years farmers have faced a number of complicated problems; some of which are related to global events, such as the pandemic Covid-19 (2019–and the effects thereafter) and some others related to problems within this cluster, such are production standards, costs and consequently sales in the market. The decline in sales has particularly affected farmers' their family economy and sustainable regional development.

Production standards and technology followed affect the safety of agricultural products and consequently consumption, and several times this issue has been the subject of discussions in Tirana markets. In this theater of developments the dynamics are also characterized by various other interactions. Worrying have been e.g. migration indicators, especially among youngest and the most qualified, and these socio-demographic changes may have also an impact in this context. Given the changes in the structure of consumers demand, there may be changes in demand factors and consumption of domestic agricultural products produced in greenhouses. The facts from the markets of Tirana, support that the consumption of domestic products may not yet be a priority of consumers. In fact, sustainable consumption have a multi-plane importance, influencing the realization of production and the well-functioning of markets, sustainable development, economic growth, etc.

The sustainable consumption represents a "puzzle" of importance in the picture of the economy, if we look it in the light of the competitiveness of domestic production and more specifically of domestic

¹INSTAT. (2017): Albanian Institute of Statistics. www.instat.gov.al.

consumption and implications. *Consumption* of domestic vegetables produced in greenhouses can be affected by socio-demographic changes with an impact on demand factors, including *age*, perception on *food safety* and the consumers' *education*. Testing the above factors and assessing their impact on the consumption of domestic agricultural products, illustrating with a case study from the markets of Tirana represents a subject with curiosity (1) theoretical and research and (2) practically informative for market actors or consumer protection organizations. (3) Assessing the functioning of domestic markets and the potential implications represent a primary task for market monitoring institutions.

The research literature in recent years has a growing and multidisciplinary focus on the issue of food consumption and the most influential factors in different countries. The age have an influence on fruit and vegetable consumption². High vegetable consumption may be associated with slower rate of cognitive decline with older age³. The proportion of a low consumption of vegetables increases with age⁴. Concerns about food safety influence the way in which consumers confront the question of where, how and from whom they buy their fresh vegetables⁵. While the safe vegetable production and distribution affect to the wide spread of the consumer trust, the state failure in food safety protection reported widely between developing countries⁶. There is augmentation of respondents "worrying about food-safety problems" in EU and it comprise a significant share of 48% of European consumers (and Bulgarian consumers 75%) indicate that consumed food by using improper using pesticides/chemicals "very or fairly likely" can damage their health⁷. Increases in education leads to higher likelihood of preferences for vegetables⁸. The lower paternal educational level it is negatively associated with the consumption of vegetables⁹. Factors, especially the age and the level of education influence to the consumption of fresh fruits and vegetables¹⁰. According to social class and household members or being married, compared to being single may affect a persons vegetables intake via eating and socio-cultural norms or home availability of vegetables and so on¹¹. Previous research have demonstrated that family members' eating habits are similar, by reveals that vegetable intake predicts also the vegetable intake

by spouses, children and adolescents¹². The age of consumers, educational level and the perception safety, are the main determinants of consumer's¹³.

2. Objectives and hypotheses

The main objective of the paper is to test the potential impact of several variables, such as age, food safety and consumer education of the interviewees to the consumption of the agricultural domestic products, illustrating with a case study from the markets of Tirana and more specifically with the consumption of tomatoes produced in greenhouses.

Specific objective

Through findings and recommendations, to create a socio–demographic profile of the consumer in the markets of Tirana who consumes agricultural domestic vegetables produced in the greenhouses.

The study hypotheses are:

- H1 — the age of consumers affect to the consumption of domestic produced tomatoes;
- H2 — perception of food safety affect to the consumption of domestic produced tomatoes;
- H3 — the education of consumers affect to the consumption of domestic produced tomatoes.

A research question of interest has also been formulated for research purposes; does the family structure (expressed according to the number of family–members) affect to consumption of domestic tomatoes produced in greenhouses?

The above variables and the research question are measured by the perception of consumers in the markets of agricultural–food products in the city of Tirana (October 2019 – January 2020). They are:

- Age;
- Food safety
- Education
- Family members

3. Measurement procedure

A questionnaire was construct for the realization of the paper and after testing in advance in a focus group and adaptation with some adjustments it was used in the study area (in the agricultural–food markets in the municipality of Tirana), by interviewing consumers (220) according to random choice procedures. The above variables are measured by scales (1–5) and interviewed consumers have been responded to the respective questions according to scaling applied.

Based on data provided a linear statistical model is used to test the above variables. The significance of the variables under review is presented in the following table (table 1).

4. Conclusions and discussions

The paper in accordance with the objectives provides an analytical presentation of the problem of consumption of domestic vegetables according to consumer characteristics, by presenting a case study from the markets of agricultural-food products in Tirana, Albania.

The age, according to linear statistical model (table 1) results a very influential factor to the trend of tomato consumption in the markets of Tirana. With increasing the age of consumers, demand trend for domestic vegetables produced in greenhouses falls and this also can be explained by the decline in consumption generally with aging. However it is important to note that dietary foods with vegetables of older age affect to the healthy nutrition, longevity and protect against disease and this problem in addition to consumption has a number of implications. Findings indicate that higher consumption of vegetables is significantly associated with a lower risk of depressive symptoms¹⁴. The migration of the youngest abroad may also affect the decline in consumption generally.

Food safety, results an influential and positive factor to the trend of consumption of domestic tomatoes. With increasing of standards of food safety throughout the chain from production to marketing the chances increase for the consumption of more domestic vegetables in the markets. Important external and internal factors may be involved. Increased competition with foreign products may call into question the production practices and standards of domestic products. Consumers may be faced with other more competitive alternative offers. The perception is important for the consumer behavior of

¹⁴Cheng H.Y., Shi Y.X., Yu F.N., Zhao H.Z., Zhang J.H., Song M. (2019): Association between vegetables and fruits consumption and depressive symptoms in a middle-aged Chinese population: An observational study. *Medicine (Baltimore)*, vol. 98 (18); e15374.

buyers and consequently deserves more attention to possible causes. The issue of food safety is related to production, sales in the domestic market, exports and competitiveness.

Education, according to measurements results an influential factor to the trend of tomatoes consumption. We pointed out that the vegetable diet is recommended for nutritious food being widely considered as a diet with multifaceted and positive effects. Information on nutritious and healthy food goes hand in hand with the levels of consumers' information, their culture, their social status and their level of education. Similarly, the problem of domestic products produced in greenhouses quickly sensitizes consumers' with a higher level of education, resulting in consequences for their consumer readiness. Higher levels of education correspond to youngest and the migration may have an impact on declining consumption. Studies suggest that education improve vegetable liking and intake¹⁵.

Family members, results a very influential factor. Even intuitively in fact this finding is not a surprise. The family or coexistence between individuals is an entity that is identified by values, beliefs and common attitudes. Moreover, in the case of a multi-member family, parents develop an important responsibility not only for providing and preparing food for other family members, but also for orienting preferences towards more nutritious foods and this is a natural function of parenting. This experience is further transferred between older and younger children. On the other hand, for many reasons the family with more members tends to be more oriented by cooking at home than by other alternatives. Promoting consumption of a multi-member family maybe deserves more attention.

The paper presents a socio-demographic profile of potential consumer of the domestic agricultural products in the markets of Tirana. However the question for future research is still valid: Who consumes domestic agricultural products produced in greenhouses?

Azerbaycan'da Modernleşme Koşullarında Göç Süreçlerinin Düzenlenmesi

Ruhangiz Aliyeva¹

¹Azerbaycan Üniversitesi, Maliye ve Ekonomi Fakültesi, ruhangiz.aliyeva@au.edu.az

Özet: Beşeri Sermayenin Geliştirilmesi Beşeri sermaye, işgücü verimliliğinin artırılmasında, sürdürülebilir ekonomik büyümede, imalat ve hizmet sektörlerinin rekabet gücünün artırılmasında ve ülkenin küresel pazarlara entegrasyonunda çok önemli bir rol oynamaktadır. Azerbaycan'da ekonomiyi dönüştürmek için uygulanacak reformların ayrılmaz bir parçası olarak, beşeri sermayenin gelişiminde sürekliliği sağlayacak, işgücü verimliliğini artıracak ve ekonomik kalkınmada bilginin rolünü artıracak önlemler özel bir rol oynayacaktır. Bu, iki düzeyde sağlanacaktır:

1. beşeri sermayenin oluşumu ve gelişimi için her düzeyde eğitim kalitesinin iyileştirilmesi;
2. İnsan sermayesinin sürekli gelişiminin teşvik edilmesi, işgücü verimliliğini sağlamak için araştırma ve geliştirmeye yatırım

Azerbaycan'da göçün yasal düzenlemesine bazı yönlerden ekonomik düzenlemeler eşlik ediyor. Bu yönlerden sadece ikisi - işgücü piyasasının ve göçmen işçi dövizlerinin serbestleştirilmesi ve bu süreçlerin Azerbaycan'daki makroekonomik etkileri, "beyin göçü" üzerindeki etki de dahil olmak üzere - daha önemlidir. Bununla birlikte, hem yaşamak hem de çalışmak için elverişli koşullara sahip olan ülkeler göç için seçilmiştir. Bu, iki belirleyiciyi daha ortaya çıkarır: göç eden ülkedeki yasalara uyum düzeyi ve göçmenin topluma entegre olma yeteneği. Bu belirleyicileri kullanarak, Tinbergen tarafından ülkeler arasındaki dış ticareti analiz etmek amacıyla önerilen "çekim modeli", uluslararası göç akışlarına yapılan diğer değişikliklerde uygulanabilir.

Anahtar Kelimeler: işgücü piyasası, uluslararası göç, hizmet sektörü.

Giriş

Araştırmalar, politik duyarlılık göz önüne alındığında, çoğu durumda bu yöntemlerden ikincisinin, yani göçün serbestleştirilmesinin daha az tercih edildiğini göstermektedir. Bununla birlikte, gelişmiş ülkelerdeki işgücü potansiyelindeki düşüş, kalifiye işgücü için artan bir küresel talebe yol açmıştır. İşgücü için artan küresel talep, uluslararası trafik maliyetlerinin azalması ve hareketin kolaylaştırılması nedeniyle, GATS'in dördüncü yöntemine artan bir odaklanma var. Azerbaycan, dünyanın en yüksek göç oranına sahip ülkelerinden biridir. Göçmenlerin çoğunluğunu Ermenistan'dan sınır dışı edilen Azeriler oluştururken, çeşitli amaçlarla veya daimi ikamet için Rusya Federasyonu'na ve diğer ülkelere seyahat eden Azerbaycan vatandaşları ise göçmenlerin çoğunluğunu oluşturuyor. Azerbaycan'daki göç süreci ve çeşitli yönleri ilgili mevzuatla düzenlenmektedir. Azerbaycan Cumhuriyeti Anayasası ve göç süreci ile bağlantılı olarak kabul edilen tüm kanunların, insanların serbest dolaşımına ilişkin uluslararası hukuk ve normlarla uyumlu hale getirildiği unutulmamalıdır. Azerbaycan Cumhuriyeti Göç Kanunu, Azerbaycan Cumhuriyeti "Göçmenlik Kanunu", Azerbaycan Cumhuriyeti "Gidiş, Giriş ve Pasaportlar", "Tek Pencere "Göç Süreci Yönetiminde İlke" Azerbaycan Cumhuriyeti Cumhurbaşkanı Kararı [6], Azerbaycan Cumhuriyeti "Yabancılar ve Vatansız Kişilerin Hukuki Statüsü" [7] ve diğer yasama işlemleri ve değişiklikleri ve çeşitli zamanlarda yapılan eklemeler, Azerbaycan'daki göç sürecini düzenlemek için yasal bir temel oluşturmaktadır.

Azerbaycan'da göç süreçlerinin dinamikleri

Azerbaycan dahil herhangi bir ülkede göçün yasal düzenlemesine, bazı yönlerinin ekonomik düzenlemesi (veya serbestleştirilmesi) eşlik eder. Çalışmamızda, bu yönlerden sadece ikisini inceliyoruz - işgücü piyasasının ve göçmen dövizlerinin serbestleştirilmesi ve ayrıca bu süreçlerin Azerbaycan'daki makroekonomik etkileri, "beyin göçü" üzerindeki etkisi dahil. Azerbaycan'dan işgücü göçünün ana belirleyicisi, göç eden ülkede daha yüksek gelir elde etme olasılığı ile ilgilidir. Bununla birlikte, hem yaşamak hem de çalışmak için elverişli koşullara sahip olan ülkeler göç için seçilmiştir. Bu, iki belirleyiciyi daha ortaya çıkarır: göç eden ülkedeki yasalara uyum düzeyi ve göçmenin topluma entegre olma yeteneği. Bu belirleyicileri kullanarak, Tinbergen tarafından ülkeler arasındaki dış ticareti analiz etmek

amacıyla önerilen "çekim modeli", uluslararası göç akışlarının diğer değişikliklerine uygulanabilir. Göç akışları ayrıca 1) ülkelerin GSYİH'sine ve 2) bu ülkeler arasındaki mesafelere bağlıdır. Böylelikle göçmenler, yaşam koşullarının daha iyi ve işlerin daha kolay olduğu ülkelere gidiyor. Göçmenler için temel koşul istihdam ve güvenlidir. Ancak ülkeler arasındaki mesafe de önemlidir. Bu nedenle, göçmenler, zaman zaman ailelerini ziyaret etmek zorunda oldukları için daha düşük seyahat masraflarıyla ilgileniyorlar. Uzun mesafelerin bir diğer dezavantajı da göçmenlerin topluma uyum sağlamasıdır. Komşu ülkelerde göçmenler topluma daha hızlı uyum sağlar. Azerilerin Gürcü veya Rus toplumlarına adaptasyonu Avrupa toplumlarına göre daha kolay ve hızlıdır. Bu nedenle göç sürecindeki diğer göstergeleri de hesaba katmak önemlidir. Örneğin, 1) ülkelerdeki işsizlik düzeyi; 2) ülkelerdeki ortalama maaş seviyesi; 3) nüfusun ortalama geliri; 4) ortalama yaşam giderleri; 5) ülkelerde ekonomik özgürlük; 6) uluslararası etnik yakınlık, 7) dil ve iletişim sorunları, 8) uluslararası vize rejimi; 9) doğal iklim koşulları, 10) ülkelerdeki sosyo-politik durum (savaşlar vb.) Ve diğer faktörler göç sürecini ciddi şekilde etkiler

Azerbaycan'ın diğer ülkelerle olan göç ilişkilerinin analizi, bağımsızlıktan son yıllara kadar ülkeden gelen toplam göçmen sayısının toplam göçmen sayısını keskin bir şekilde aştığını göstermektedir. Son 25 yılda göçmen sayısı 200.000 ile 400.000 arasında azaldı. Toplam göçte de keskin bir düşüş var. Bu nedenle, göçmenlerin çoğu, SSCB'nin çöküşüyle bağlantılı olarak 1990-95'te diğer ülkelere giden insanlardı. İlerleyen yıllarda, 1) göçmenlerin belirli bir kısmı diğer ülkelerin vatandaşlığını kazanarak daimi ikamet hakkını elde eder; 2) belirli bir parçanın iadesi; 3) ayrıca her yıl göçmen sayısındaki azalma, toplam göçmen sayısında keskin bir düşüşe neden olmuştur. 2014 yılında petrol fiyatlarındaki keskin düşüşün Azerbaycan'dan Rusya'ya göçmenlerin sayısı üzerinde önemli bir etkisi olduğu, ancak Kazakistan'a göçmen işçi sayısının önemli bir etkisi olduğu unutulmamalıdır. Böylece, Uluslararası Göç Örgütü'ne göre, 1990'dan 2020'ye kadar Azerbaycan'dan Kazakistan'a göçmen sayısı istikrarlı bir şekilde 35.800'den 49.600'e yükseldi. Rusya'daki Azerbaycanlı göçmenlerin sayısı 1990'dan 2020'ye 100.000'den fazla azaldı. Şu anda Rusya'da 700.000'den fazla Azeri göçmen çalışmaktadır. Azerbaycan'da 2005 yılından itibaren manatın dolar karşısında güçlenmesi ve gelirlerdeki artış, göç hacmini azaltmış, tersine göç hacmini artırmıştır. Veya 2014'te Rusya'daki rublenin keskin devalüasyonu, Rusya'daki göçmen hacmini önemli ölçüde azalttı.

Son yıllarda Azerbaycan manatının keskin devalüasyonu Azerbaycan'dan göçü yeniden artırdı. Dolayısıyla, ulusal para biriminin devalüasyonu, yaşam kalitesi ve yaşam maliyeti üzerinde ciddi bir etkiye sahip olduğu için göçü şu ya da bu yönde hızlandırır. Rusya, Azerbaycan'dan gelen kalıcı veya geçici göçmenlerin büyük bir kısmını oluşturmaktadır. Etnik, dil ve dini bakımdan Azerbaycan'a yakın ve hatta daha yakın olan Türkiye'ye seyahat eden Azerbaycan vatandaşlarının sayısı Rusya'dakinden çok daha az. Azerbaycan'dan göçün belirleyicileri tüm ülkeler için tespit edilemiyor. Uluslararası Göç Örgütü'ne göre, Azerbaycan'dan Ermenistan'a 87.000'den fazla ve İsrail'e 13.000'den fazla kişi göç etti. 2015 verilerine göre göçmen sayısında Rusya, Ukrayna ve Kazakistan baskındır. Ancak bu ülkelere göç sürecinin belirleyicileri tamamen farklıdır. Örneğin, Ermenistan'a göçmenler, Ermenistan'ın Azerbaycan topraklarına yönelik saldırganlığı nedeniyle yaşanan ulusal ihtilaf sonucunda ülkeyi terk etti. Amerika Birleşik Devletleri'ne ve İsrail'e göç edenlerin çoğu, kalifiye işçi olarak daha iyi yaşam koşulları elde etmek için kalıcı olarak yaşamak üzere Azerbaycan'dan ayrıldı. Rusya, Ukrayna ve Kazakistan'a göç edenlerin çoğu işçi göçmenleridir. Bu insanlar Azerbaycan ile düzenli temas halindedir ve Azerbaycan'a para aktarırlar.

Azerbaycan'dan gelen göçmenlerin çoğu, farklı bölgelerdeki 30'dan fazla ülkeden geliyor. Emekçi göçmenlerin çoğunluğunun Rusya, Ukrayna, Kazakistan, Türkiye ve Gürcistan gibi ülkelerde bulunduğu varsayılabilir. İşçi göçmenleri hakkında diğer göç türlerinden farklı istatistikler elde etmek zordur. Özellikle, yıllık göçmen akışı için istatistiksel bir temel olmadığından, göçün ekonomik etkilerini ayrıntılı olarak analiz etmek zordur. Azerbaycan vatandaşlarının göç ettiği başlıca ülkeler arasında Rusya, Ukrayna, Kazakistan, ABD, Almanya ve Türkiye yer almaktadır. Asıl nokta, bu ülkelere göçün 2017 yılında 2015'e göre azalmamasıdır. Özellikle, azalan petrol gelirlerinin arka planında, Rusya'daki ekonomik gerileme durdukça Rusya'ya göç artmaya başladı. Bir başka ilginç nokta, son iki yılda Birleşik Krallık ve Çek Cumhuriyeti'ne göçün azalmasıdır. Muhtemelen, bu tür azaltımların ana nedeni, Azerbaycanlı göçmenlerin bu ülkelere geri dönmesi değil, Avrupa Birliği içinde yer değiştirmeleri olabilir. Bu nedenle, Avrupa ülkelerinden Azerbaycan'a göçmenlerin dönüşü çok nadirdir. Şekil 3'teki diyagramlar ayrıca

Azerbaycan'dan Avrupa ülkelerine göçün giderek arttığını göstermektedir. Azerbaycan'ın 2010 yılına kadarki ekonomik gelişimi ve küresel ekonomik kriz Azerbaycan'dan gelen göç dalgasını önemli ölçüde zayıflatsa da 2015 yılından itibaren göç yeniden artmaktadır. Azerbaycan'dan diğer ülkelere göçün belirleyicileri, hedef ülkedeki kişi başına düşen GSYİH, bu ülkelerdeki işsizlik düzeyi veya ülkeler arasındaki mesafe ile sınırlı olmamalıdır. Göçün ana belirleyicileri arasında, uluslararası kültürel bağlar veya dil yakınlığı ile topluma daha kolay entegrasyon fırsatları bulunmaktadır. Öte yandan, bazı durumlarda, ülkede kanunun yüksek düzeyde korunması, göçü kolaylaştırmaktan çok zorlaştırmaktadır. Örneğin, Rusya'daki iş ortamı Polonya'dakinden daha elverişsiz. Bununla birlikte, Polonya'ya göç Rusya'dakinden daha zordur. Rusya'da gayri resmi iş yapmak veya Rus toplumuna entegre olmak daha kolaydır. Dil, din, hane halkı, kültürel ve diğer benzerliklere rağmen Azerilerin Rusya'ya göçü Türkiye'ye göç etmekten daha kolaydır. Tüm bu faktörler, göç sürecinin ekonomik belirleyiciler düzeyinde analizinin tek taraflı olduğunu ve sorunun ayrıntılı olarak tanımlanmasına izin vermediğini düşündürmektedir. Bununla birlikte, göç sürecini niteliksel olarak değerlendirmek için, bazı ekonomik belirleyicilerin göç değişiklikleri üzerindeki etkisini niteliksel olarak değerlendirmeye çalışın. Azerbaycan'dan gelen göçmenler tarafından seçilen varış ülkeleri, göç açısından birçok karşılaştırmalı avantaja sahiptir. Birincisi, bu ülkelerin çoğunun daha yüksek bir küreselleşme seviyesi var. Göçmenler, kendilerinininkinden daha küreselleşmiş bir hedef ülkeyi tercih ediyor. İkincisi, çoğu hedef ülkede GSYİH Azerbaycan'dakinden daha yüksektir. Üçüncüsü, neredeyse tüm hedef ülkelerde, maaşlı işçilerin toplam istihdam içindeki payı Azerbaycan'dakinden daha yüksektir. Asgari ücret alt endeksindeki ülkeler arasındaki farklılıkların göç için karşılaştırmalı bir avantaj yaratmadığı unutulmamalıdır. Azerbaycan'da son 20 yıldaki göç dinamikleri ve çeşitli göstergeleri; 1) küreselleşmenin derecesi; 2) a.b. GSYİH; 3) Gini indeksi; 3) maaşlı çalışanların toplam işgücü içindeki payı; 4) Asgari ücretin alt endekse bağımlılığını düşünün. Azerbaycan'dan diğer ülkelere göçmenlerin ana nedeni ekonomik olmakla birlikte, bu ülkelerin ekonomik avantajları bu tür bir göç için hedef ülke seçiminde kilit bir rol oynamamaktadır. Yukarıda belirtildiği gibi, göçmenler için ana hedef ülkeler olarak Rusya ve Ukrayna'nın seçilmesinin devam etmesi, büyük ölçüde bu ülkelerdeki Azerilerin etnik muamelesinden kaynaklanmaktadır. Ekonomik faydalar, sosyal ve etnik yakınlıktan ve göçmenlerin topluma daha kolay entegre olabilmelerinden daha az önemlidir. Araştırmalar, küreselleşme endeksinin göç hacminin logaritması, mesafe hacminin logaritması, mesafe, GSYİH, ücretlilerin toplam çalışan sayısı içindeki payı ile toplam çalışan sayısı arasındaki ilişkide daha önemli bir rol oynadığını göstermektedir. küreselleşme endeksi. Her halükarda, Azerbaycan'dan diğer ülkelere göç sürecinde hedef ülkelerin özgürlük düzeyi önemlidir. Araştırmalar, Azerbaycan'daki göç sürecinin özünde ekonomik faktörlerin de küçük bir rol oynadığını gösteriyor. Azerbaycan'a gelen göçmen sayısının azlığı ve bu tür göçmenler arasında ücretsiz işçi göçmenlerinin küçük payı, hedef ülke olarak Azerbaycan'ın henüz göç için bir avantaja sahip olmadığı anlamına geliyor. Göçmenler hakkında kabul edilen yasaların burada da etkisi var. Bu göstergelerin bir grubu "göçün nedeni" (işsizlik, ortalama ücretler, ortalama gelirin yanı sıra ortalama yaşam maliyeti, ekonomik özgürlük seviyesi vb.) Ve bir diğer grup "göç yönü" dür. (örneğin, göç ülkesindeki yaşam standartları, yaşam standartları). maliyetler, vize rejimi, etnik bağlantı, dil bağlantısı vb.). Yukarıdaki 7 gösterge (GSYİH, ülkeler arası mesafe, işsizlik oranı, ülkedeki ortalama maaş seviyesi, ortalama gelir, ortalama yaşam giderleri, ülkedeki ekonomik özgürlük seviyesi) ölçülebilir ve diğer 5 gösterge (uluslararası yakınlık, dil ve iletişim sorunları), uluslararası vize sorunlar, doğal iklim koşulları, uluslararası siyasi durum) modele hayali bir gösterge olarak dahil edilebilir. Bununla birlikte, ilk yaklaşımda, göç hacminin 3 göstergesi vardır - 1) Göç ve göç ülkelerinin GSYİH'si (Yj); 2) uluslararası mesafe (Dj); 3) işsizlik oranına (U j) bağımlılık incelenebilir. Tabii ki, bu durumda, yukarıda listelenen diğer 8 veya daha fazla gösterge dikkate alınmadığı için model tam olarak kabul edilemez. Tinberg'in göç için "yerçekimi modeli" uygulamasının bazı özelliklerine dikkat etmek önemlidir. Böylelikle göç sürecine dinamik bir süreç olarak değil, statik bir süreç olarak yaklaşacağız ve burada zaman faktörü dikkate alınmayacaktır. Göç süreci, bağlı olduğu göstergelerin çoğunun önceki dönem değerlerine bağlıdır. Bu yıl herhangi bir ülkedeki göç sürecini incelersek, en azından birkaç yıl boyunca bağlı olduğu göstergeleri incelemeliyiz. Öte yandan, göç hacmini, yani ülkeler arasındaki mesafeyi etkileyen ana faktör olarak değerlendirilen ikinci gösterge, yalnızca eyaletlerin başkentleri arasındaki mesafe olarak alınmıştır. Ancak göç sürecinde daha fazla sınır bölgesinin kullanıldığı dikkate alınmalıdır. Uluslararası işgücü göçü için yerçekimi modelinin uygulanmasının bazı avantajları not edilebilir: 1) yerçekimi modeli, belirli bir yakınsama aralığında uluslararası ticaret, göç ve finansal akışların nitel ve nicel değerlendirmesi için önerilen basit bir modeldir; 2) kütleçekimsel modelin avantajı, teorik modelden özel bir durum olarak da alınabilmesidir, örneğin, rasgele faydanın maksimizasyonu modelinden 3) yerçekimi modeliyle ilişkili

analitik zorlukları hesaplamak için farklı yöntemler vardır; 4) Ampirik bir model olarak, çekim modeli ek değişkenlerle genişletilebilir. Çekim modeli uygulamasının eksiklikleri de şu şekilde gruplanabilir: 1) Çekim modeli, iki ülkenin ekonomileri hakkında farklı bilgiler gerektirir. Çoğu durumda, bu tür bilgileri elde etmek zordur; 2) Yerçekimi modelindeki bazı değişkenlerin yaklaştırılması, sonuçların ciddiyeti konusunda şüphe uyandırır. Örneğin ülkeler arası uzaklık olarak hangi mesafe daha uygundur: ülkelerin başkentleri arasındaki mesafe mi yoksa sınıra en yakın yerleşim yerleri arasındaki mesafe mi? 3) Herhangi bir ülke için yerçekimi modeli aracılığıyla işgücü göçünü tahmin ederken mümkün olduğunca çok belirleyici kullanmak önemlidir. Aksi takdirde, bu modelin işgücü göçünü tahmin etmede kullanılması daha zordur. Göç süreci ve ekonomik etkileri üzerine araştırma yürütmedeki ciddi zorluklar, göçmenlerin ve göçmenlerin güvenilir istatistiksel dinamiklerini ülkeye göre ve belirleyicilerle ilgili istatistiklerin elde edilmesinin zor olmasından da kaynaklanmaktadır. Uluslararası Göç Örgütü'nün istatistiklerinde belirleyicilere ilişkin istatistik eksikliği, göçmen işçi işçilerinin doğru raporlanmasına izin vermemektedir. Örneğin, 1989-1990'da Ermenistan'dan sınır dışı edilen Azeriler, BM istatistiklerinde hâlâ göçmen olarak listeleniyor. Benzer hatalı istatistikler diğer ülkelerde bulunabilir. Bu nedenle, yerçekimi yöntemiyle göç sürecini inceleyerek elde edilen sonuçlar gerçek resmi önemli ölçüde değiştirir. Bununla birlikte, yerçekimi yöntemi, ilk yaklaşımda göç sürecinin manzarasını niteliksel olarak değerlendirmek için kullanılabilir. Bu göç değerlendirme modelinden de görülebileceği gibi, iki ülke arasındaki göç hacmi doğrusal olarak bu üç faktöre bağlı olmayabilir. Göç hacimleri için bir "yerçekimi modeli" inşa ederek, gelecek için göç ve göçün hacmi kabaca tahmin edilebilir. Ancak bu durumda, tüm göstergeleri olabildiğince dikkate almak önemlidir. Tüm ülkelerde olduğu gibi, işçi göçmenleri ve öğrenciler Azerbaycan'ın göçünde kilit rol oynamaktadır. Göçmen işçi dövizleri, Azerbaycan'a yapılan mali transferlerin önemli bir parçasıdır. 2000-2015 yılları arasında göçmen havaleleri, doğrudan yabancı yatırımdan sonra ülke için ana finansman kaynağıydı. Bu tür finansal kaynaklar ile DYY arasındaki temel fark, doğrudan hane halkına yönlendirildikleri için nüfusun sosyal sorunlarının çözümünde önemli bir rol oynamalarıdır. Tablo 6, Azerbaycan'daki büyük mali transferlerin dinamiklerini göstermektedir. Tablo, göçmen dövizlerinin ülkeye yapılan resmi kalkınma yardımını çok aştığını göstermektedir. Bazı yıllarda bu miktar 2 milyar dolara yaklaştı veya kişi başına 210 dolardan fazlaydı. Azerbaycanlı göçmen işçi göçmenlerin diğer ülkelere, özellikle Rusya'ya, genellikle daha az uzmanlık gerektiren işlerde para transferi, hanehalkının sosyal sorunlarının bir bütün olarak çözümünde olumlu bir etkiye sahiptir. Ancak uzun vadede bu, ülke ekonomisinin zayıflamasına zemin oluşturuyor. Çünkü çeşitli amaçlarla ülkeden gelen ortalama bir göçmenin eğitim, bilgi ve becerileri ulusal ortalamanın üzerindedir. Bu nedenle, bir göçmen varış ülkesinde çalışmak için en az iki dil bilmeli ve belirli bir bilgi ve beceriye sahip olmalıdır. Bu tür bireylerin ülke ekonomisinden uzaklaşması hem ekonomik büyümeyi hem de hanehalkını zayıflatmaktadır. Belli sayıda göçmenin, özellikle de genç göçmenlerin kendi ülkelerine dönmediğini hesaba katarsak, o zaman devletin başka bir ülkenin ekonomik kalkınması için beşeri sermayeye harcadığı ortaya çıkıyor. Öte yandan, yüksek eğitilmiş veya deneyimli profesyonellerin ayrılması bir "istihbarat akışı" yaratır

Ekonomik liberalleşmenin göçmen işçi dövizleri üzerindeki etkisine ilişkin ekonomik literatürde ilginç çalışmalar bulunmaktadır. Örneğin, Mookeijee ve Roberts , Niimi ve diğerlerinin yanı sıra Bettin ve diğerlerinin çalışmaları, finansal serbestleşmenin göçmen dövizlerinin ana belirleyicilerinden biri olduğunu göstermiştir. Freund ve Spatafora , artan göçmen transferlerinin gelişmekte olan ülkeler için önemli bir finansman kaynağı olduğunu düşünmektedir. Göçmen havalelerinin ve işletme maliyetlerinin belirleyicilerini inceleyerek, işçi dövizlerinin göçmen sayısı ile pozitif yönde, işlem maliyetleri ve döviz kuru kısıtlamaları ile olumsuz yönde ilişkili olduğu sonucuna varmışlardır. Ülkenin finansal sistemi ne kadar liberal ve döviz kuru ne kadar istikrarlı olursa, işletme maliyetleri o kadar düşük olur. Yüksek işletme maliyetleri nedeniyle, göçmenler havalelerini bankalar yerine diğer gayri resmi kanallardan göndermeyi tercih ediyorlar. Kose ve diğerleri , Obstfeld Rodrick ve Subramanian tarafından yapılan çalışmalar da finansal serbestleşmenin göçmen dövizlerindeki işlem maliyetleri üzerindeki etkisini ele almıştır. B. James, M. Aniruddha ve U. Phanindra, 1990-2005 döneminde 84 ülkede finansal serbestleşmenin göçmen işçi dövizleri üzerindeki etkisini incelemişler ve finansal reformların serbestleştirilmesinin veya direncinin göçmen dövizleri üzerinde farklı bir etkiye sahip olduğu sonucuna varmışlardır. Mali sektörde devlet kontrolü azaldıkça ve serbestleşme arttıkça, kredi kullanımı genişler ve ekonomi üzerindeki olumlu etkiler artar .

Göçmen transferlerinin düzenlenme mekanizmasını daha iyi anlamak için, transfer kanallarının basitleştirilmiş şemasına bakalım . Göçmen göçünün serbestleştirilmesi derken, devletin bu süreçte dayattığı kısıtlamaların azaltılmasını kastediyoruz. Şekil 14'teki diyagramdan da görülebileceği gibi, göçmen dövizlerinin sınırlandırılması veya serbestleştirilmesi sadece işçi dövizleri için değil, aynı zamanda alıcı kanallar için de geçerli olabilir. Bu kanallardan yalnızca ikisinin (yani kuryeler ve akrabalarla taşınırken) nakit veya mal aktarması nedeniyle bu alanların daha kısıtlı olduğu unutulmamalıdır. Azerbaycan mevzuatına göre, bu şemadaki herhangi bir kanal para transferleri için kullanılabilir. Ancak transferin miktarı belli kısıtlamalar uygulanır. Bu tür kısıtlamalar hem transfer kanalları hem de devlet tarafından uygulanabilir.

Göçmen havalelerinin hacmi, öncelikle göçmen işçi sayısına bağlıdır. Azerbaycan için, ülkeye yapılan havalelerin büyük bir kısmı diğer ülkelerde çalışan göçmen işçi işçilerine düşüyor. Azerbaycan'dan diğer ülkelere yapılan transferlerin büyük kısmı, farklı ülkelerde okuyan veya geçici olarak yaşayan Azerbaycan vatandaşlarına düşüyor. Azerbaycan'dan diğer ülkelere göçmen dövizlerinin hacmi yüksek olmasa da göz ardı edilemez. Bunun nedeni Azerbaycan'a diğer ülkelerden gelen işçi göçmenlerinin sayısının Azerbaycan'dan gelen işçi göçmenlerinin sayısından çok daha az olmasıdır. Diğer ülkelerde olduğu gibi Azerbaycan topraklarından çeşitli amaçlarla ayrılan Azerbaycan vatandaşları da ülkeye belli bir miktar para aktarıyorlar. Bu transferlerin hacmi 2000 yılından bu yana önemli ölçüde artmıştır. Böylece, 2000 yılında kişi başı göçmen transferleri 7,1 \$ olurken, 2012 yılında transfer hacmi 214,1 \$ 'a çıkarak son 15 yılda maksimuma ulaştı. 2014 yılında Rusya'da yaşanan ekonomik krizin ardından transfer hacmi 2015 yılında 131,6 ABD dolarına, 2016 yılında 65,88 ABD dolarına gerilemiştir. Bununla birlikte, bu hacim aynı zamanda nüfusun gelirinin önemli bir bölümünü oluşturmaktadır. Görüldüğü gibi, göçmen transferleri, doğrudan yabancı yatırımdan daha az olmasına rağmen, nüfusun doğrudan sosyal durumu üzerinde daha büyük bir etkiye sahiptir ve ülkeye yapılan mali transferlerin önemli bir kısmını oluşturmaktadır (yaklaşık% 50). Rusya'da ekonomik krizden sonra bu tür transferlerin hacmi önemli ölçüde azalırken, göçmen transferlerinin manatın döviz kuru üzerindeki etkisi bir nebze olsun oldu.

Sonuçlar

1. Ulusal paranın zayıflaması veya güçlenmesi, yaşam kalitesi ve yaşam maliyeti üzerinde ciddi bir etkiye sahip olduğu için göçü şu veya bu yönde hızlandırır.
2. Azerbaycan vatandaşlarının göç ettiği başlıca ülkeler arasında Rusya, Ukrayna, Kazakistan, ABD, Almanya ve Türkiye yer almaktadır.
3. Azerbaycan'dan gelen göçmenler tarafından seçilen çoğu varış ülkesinde küreselleşme seviyesi daha yüksektir.
4. Azerbaycan'dan gelen göçmenlerin GSYİH'si çoğu hedef ülkede Azerbaycan'dakinden daha yüksektir.
5. Azerbaycan'dan gelen göçmenlerin neredeyse tüm varış ülkelerinde, toplam çalışan sayısı içinde maaşlı çalışanların payı Azerbaycan'dakinden daha yüksektir.
6. Ülkeler arasındaki asgari ücret farklılıkları, göç için karşılaştırmalı bir avantaj yaratmamaktadır.
7. Azerbaycan için, ülkeye giren para transferlerinin büyük bir kısmı diğer ülkelerde çalışan göçmen işçi işçilerine düşüyor.
8. Göçmen transferleri, doğrudan yabancı yatırımdan daha az olmasına rağmen, nüfusun doğrudan sosyal durumu üzerinde daha büyük bir etkiye sahiptir ve ülkeye yapılan mali transferlerin önemli bir bölümünü oluşturur.

Abstract: Investment funds, as institutional investors at the capital market, are financial institutions that mediate between the owners of free financial resources, on the one hand, and the corporate sector, which needs financial resources, on the other. In this way, investment funds raise assets that are invested in the international financial market by creating a diversified investment portfolio. The attractiveness of investment funds is based on the possibility of achieving a higher rate of return compared to the conventional way of saving the money in banks.

Investment funds are one of the fastest growing financial institutions, whose role and importance is especially emphasised in developed market economies. However, these institutional investors play a negligible role in the capital market in developing and transition countries since they are still in their initial phase of their development and they are unknown to the general public.

There are 17 open-end investment funds in the Republic of North Macedonia, managed by 4 investment fund management companies. Despite the small market share, investment funds have enormous importance, because, in addition to risk diversification and professional asset management, they offer small investors the opportunity to be indirectly exposed to capital markets. Compared to other institutional investors, Investment funds recorded the highest returns by the end of 2019. Growth was also evident in 2020, despite the negative trends appearing at the beginning of the year, as a result of the consequences with the first wave of the Covid 19 pandemic.

Having in mind the previous findings, the main objective of the research in this paper is analysis of the current position and perspectives for development of investment funds in the Republic of North Macedonia, with special emphasis on the measures to increase public awareness of how investment funds function and the benefits of investing in them.

Keywords: Capital market, Investment funds, Investment Fund Management Companies

1. INTRODUCTION

Financial intermediaries are the most important institutions in the capital market because they connect the entities that have excess capital with those that need that capital for their business activities or personal needs. They play a major role in the development of the capital market, providing stronger competition in the financial market, stimulating financial innovation, encouraging the development of regulation and modernising the market infrastructure. However, in order for the capital market in a country to function successfully, it is necessary to have good regulation and supervision, as well as appropriate institutional participants such as stock exchanges, brokerage companies, investment funds, investment companies and others.

Investment funds are characterised by collective investment, which means that investors have the opportunity to raise funds, in order to generate income and lower investment risk. The property of the investment funds is managed by the investment companies (investment fund management companies). They are specialised companies that invest the investor's funds in a portfolio of securities, for a fee.

Mutual funds appeared in 1924 in the United States as a result of the rapid development of capitalism. Today, they are distributed almost all over the world, and the total value of the property is estimated at around 50,000 billion dollars. The main leaders in this field are the United States, whose total value of net assets of open-end funds is about 45% of total assets worldwide (Jeremic et al., 2019).

In the European Union, the first classic investment fund is considered to have been established in 1868, but a significant development of open-end investment funds, in the modern sense, did not occur until 1990. Today there are more than 60,000 investment funds.

In our country, the first preconditions for the emergence of investment funds are created by the adoption of the Law on Investment Funds in 2000. However, the first open-end fund management company was not established until 2007. There is an opinion within the academic community that this is due to the underdeveloped securities market in Macedonia, lack of interest from foreign investors, insufficient knowledge of the advantages of this type of financial institutions and poor investor protection within that period.

In the next thirteen years, the pace of establishing investment fund management companies and the establishment of investment funds significantly increases, despite the fact that this type of institutional investors are far from the role they play in Europe and the world. Therefore, since 2009 several amendments to the legislation have been made, correlating it with the directives of the European Union (UCITS - Undertakings for Collective Investment in Transferable Securities), which creates a greater opportunity for opening the Macedonian market of capital for foreign investors, through greater protection of the interests of investors and greater control over investment funds.

The emergence and development of investment funds is of great importance to our economy because it raises the banking and financial sector to a higher level and promotes and encourages different ways of saving. This increases the overall savings in the economy and the efficiency of investments, primarily by investing in the most profitable securities with a certain level of risk.

2. INVESTMENT FUNDS - CONCEPT, TYPES AND REGULATORY

An investment fund is a financial institution that raises funds for small individual investors, to whom in return it issues shares or certificates of participation in the fund's financial assets (units) (Soskic et al., 2009). The realised funds are invested by the investment funds on the domestic or international financial market in securities, creating a diversified portfolio. Each action of the investment fund represents a proportionate share in the portfolio of securities under its management.

With regard to investment funds, the question often arises as to why investors would invest in mutual funds. There are several reasons for this:

- Portfolio diversification. Diversification means the process of combining securities in the portfolio, in order to reduce the total risk to an acceptable level, ie to minimise the risk for a given profitability and liquidity of the portfolio.
- Professional securities management. Investment fund management is outsourced to professional portfolio managers supported by good teams of analysts. They can more easily see the changes in the stock markets and select the appropriate securities.
- Lower service costs. Investors receive the services of investment advisers at a lower cost than contacting them directly. Also, through investment funds, transaction and other costs and commissions are reduced.
- Reliability. Given the fact that investment funds everywhere in the world and in our country, are subject to legislation aimed at protecting the interests of investors, it gives a high degree of certainty that their assets will be managed in the best possible way.

All of the above makes investment funds ideal for small investors, who are willing to take a higher risk, compared to term deposits in a bank, but therefore the return they can achieve is higher.

According to the way in which funds are mobilised, there are two types of investment funds:

- Open-end investment funds and
- Closed-end investment funds.

Open-end investment funds are the most important type of investment funds, not only in terms of the opportunities they offer, but also in terms of the assets at their disposal and their quantity.

The open-end fund itself does not have the capacity of a legal entity, that capacity is held by the fund management company, which established the fund. The owners of shares have the right, in addition to

the right to a proportionate part of the fund's profit, to demand payment of the share documents at any time, thus withdrawing from the fund. That is the essential feature of open funds.

The open-end funds purchase the issued shares on request, at a price calculated daily, based on the net value of the fund's assets per share. The net asset value per share - NAV (net asset value per share), is calculated by subtracting the value of the fund's liabilities from the market value of the portfolio on a given day and then dividing by the number of shares:

$$\text{NAV} = \frac{\text{Portfolio market value} - \text{Amount of total liabilities}}{\text{Number of shares}}$$

Closed-end funds have a fixed number of shares traded on the secondary market. Unlike open-end funds, closed-end funds operate like any other corporation in the financial market, ie they do not buy their own shares. They are usually listed on the stock exchange or on the OTC markets. In closed-end funds, in contrast to open-end funds, the number of shares remains the same. Closed-end funds are smaller in number than open-end funds, but have tended to increase in recent years.

Our legislation allows the establishment of open-end and closed-end investment funds. But so far, no closed fund has been established.

Due to the growing share of investment funds in the global market, there is a global need for the highest possible degree of harmonisation of regulations in this area. The main goal is to protect the investors' interests, so the companies that manage the funds are subject to increasingly strict regulation of their operations.

The supporting pillar of regulation is the United States, as the country with the most developed securities market. The basic regulation is the Investment Company Act of 1940, the rules of which are still applicable today.

In the European Union, operations are defined by certain directives (UCITS) and the principles of IOSCO (Objectives and Principles of Securities Regulation), which are based on three basic principles of regulation of operations (<https://www.iosco.org>):

- Investor protection;
- Ensuring that markets are fair, efficient and transparent and
- Reducing systemic risk.

In Macedonia, the operation of investment funds is regulated by the Law on Investment Funds, adopted in 2000, and amended several times to date.¹ This Law defines the term investment fund, the conditions for establishing fund management companies, the manner of operation of the management companies, the content of the company statute, the limitations and responsibilities of the company, the costs for managing the funds, the conditions for establishing funds, types of investment funds, statute and prospectus of the fund, selection and operation of the depository bank, manner of control over the operation, fines for misdemeanours and more.

3. OPEN-END INVESTMENT FUND IN THE REPUBLIC OF NORTH MACEDONIA

Investing in open-end investment funds on a global scale has a long history and offers many greater advantages over classic savings. The shares in these funds are very liquid, they are professionally managed, and there is a large dispersion of risk. It strengthens the confidence of investors and increases the number of investors on a daily basis.

¹ Since its adoption, it has been amended several times, 2007, 2009, 2010, 2011, 2013, 2015, 2016 in order to overcome the shortcomings and comply with EU directives. The last change was made on February 10, 2020, Sl.Vesnik of RSM 31/2020

Although open-end investment funds in Macedonia represent a very small part of the financial market, they have nevertheless, been characterised by high dynamics and growth in the last five years including highest returns by the end of 2019, compared to other institutional investors. Growth was evident in 2020, despite the negative trends that appeared at the beginning of the year, as a result of the consequences of the first wave of the pandemic with Covid 19 (SEC, 2020)

Currently, there are 17 open-end investment funds in North Macedonia (Table 1 – Open-end Investment Funds):

According to Low on the Investment Funds, Open-end investment fund presents separate assets, without the capacity of legal entity, whose shareholders have the right to proportional part of the fund's profit and who at any time have the right to request payment of the share, wherefore they will step out of the fund (Sl.Vesnik na RM, 2009).

The open-end fund is established by raising funds in the amount of at least 300,000 euros in denar counter-value, by means of a public call for subscription of shares in the investment fund. The Securities and Exchange Commission of RNM is the regulatory body that issues a license for the establishment of the fund, upon a previously submitted request by the fund management company.

The basic characteristics of open-end investment funds are the following:

- Liquidity - possibility for fast payment of purchased shares, at the request of the investor. The company that manages the fund is obliged to pay the funds to the investor's account within seven days;
- Reliability and yield - risk dispersion due to portfolio diversification and return on average 5 - 15%;
- Entry and exit costs - must not exceed 5% of the total value of the share;
- Guaranteed data confidentiality;
- Awareness shares' status at any time .

According to the type of investments they make, the open-end funds in RNM can be:

- Share funds;
- Bond funds;
- Mixed funds;

- Cash funds.

The entire portfolio of equity funds is in shares. It is the most precarious type of fund, but at the same time it has the opportunity to make the biggest profits. It is more commonly used for long-term investments, generally exceeding ten years.

Bond funds have full or mostly bonds in their portfolio. They are intended for conservative investors, who do not accept high risks. These funds carry less of a risk, they guarantee high security, but on the downside, they do not give the opportunity to make big profits at once. They are suitable for short-term investments.

Mixed funds (balanced or hybrid) contain stocks as well as bonds in their portfolio. They are riskier than bond funds, but have the opportunity to make more profit. It is recommended that investing takes place for a longer period of time, for example, five to ten years.

Cash funds generally have a steady and moderate growth. They invest in short-term securities and are characterised by low risk due to short maturity.

Most of the total assets of open-end funds in Macedonia are monetary funds, followed by equity funds, with bond funds being the least represented.

4. MANAGEMENT OF OPEN-END INVESTMENT FUNDS IN THE REPUBLIC OF NORTH MACEDONIA

The first open-end investment fund management company in Macedonia started operating in 2007.² Then new ones were established and by the end of 2009 there were six companies managing open-end investment funds. At present, four companies operate, after the acquisition of KD Fondovi AD and Ilirika Fund Management AD, by the Slovenian Generali Investments AD. The total number of investment funds that were being managed by the end of 2020 was 17 and they are all open-end investment funds. The number of open-end investment funds is increasing, which is indicated by the fact that by April, 2021, two more new investment funds had been founded.

The total net value of the assets of the open-end investment funds managed by the investment companies is shown in Table 2 - Net assets value of the investment funds managed by the investment funds management companies.

According to the data presented in the table, it can be concluded that KB Publikum Paricen, VFP Premium Invest and Generali Kesh Deposit have the largest share in the total value of open-end investment funds. A significant increase of 147.31% in the net value of the funds at the end of 2020 is evident, which indicates the fact that the value has more than doubled, compared to the initial period covered by the analysis.

The main purpose for creating the company which manages investment funds is to manage the property of the investment fund. In addition, the company can promote the investment fund and sell the shares in the investment funds. The scope of the company's work must include all administrative matters such as: keeping business ledgers and preparing financial statements, determining the investment fund's property value and calculating the share price, distribution of the fund's profit, keeping a register of share owners, ie shareholders and so forth. The company can also perform investment consulting, cooperation with the depository bank and other services.

A common practice and one which is legally permissible is for a company to manage multiple funds. In this way, a family of funds is created and managed by one company. This gives a significant advantage to the company's market performance in terms of knowledge use, greater concentration of funds and greater supply and competitiveness. The families of funds managed by one company are especially important for investors, because they enable the transfer from one fund to another with lower costs, which ultimately leads to greater diversification of investment risk.

² Ilirika Fund Management AD Skopje is the first investment management company in the Republic of North Macedonia

By managing the assets of investment funds, the goal of the management company is to maximise the investor's profit, not its own profit. In fact, it also strives to maximise its own profits, but only through the policy of good investment in the interest of investors.

Within the legislation related to the management of investment funds, various investments restrictions are prescribed in order to reduce risk investment. More importance is given to the following:

- Investment in securities (up to 10% of the net value of the fund's assets) not listed on the stock exchange is limited, due to the high risk that those securities carry;
- Investing in individual securities (per issuer) is limited to 10% of the net asset value of the fund;
- Investing in bonds is also limited to 25% of the total value of bonds of one issuer.
- The same restrictions apply to voting shares. The investments must not exceed more than 10% of the voting rights that the securities give to the shareholders, in order to avoid a dominant influence in the management of the companies.
- Investments of one investor in the fund are limited, as well as investments in real estate and more.

Table 2: Net assets value of the investment funds managed by the investment funds management companies³

Investment Fund	Net value in EUR (at the end of a year)

5. OPERATION INDICATORS OF OPEN-END INVESTMENT FUNDS IN THE REPUBLIC OF NORTH MACEDONIA

Open-end investment funds are new institutions on the financial market in North Macedonia, but from their inception until now, they have shown a fairly rapid growth. According to the Financial Stability

³ All values expressed in EUR are determined according to the average exchange rate of the NBRNM, on the last day of the year for which the data are presented in the table.

Report for the Republic of North Macedonia for the last five years, we can see a continuous increase in their share in the overall structure of the financial system (NBRNM, 2020), Table 3 - Structure of total assets in the financial system of North Macedonia.

According to the data in the table, the period between 2015 and 2019, saw a continuous increase in the investment fund's share of the total assets, ie from 1.8% to 2.3%.

5.1 Net assets value of open-end investment funds

One of the basic parameters of investment funds is the net assets value of the fund (NAV). NAV is calculated at the end of each trading day based on the closing market prices of the portfolio's securities, ie at the closing of the stock exchange on which they are listed and which are valid until the next day. By multiplying those prices by the quantities, ie. the number of corresponding securities in the portfolio and by adding other types of assets, the total value of the fund assets is obtained. When this value is reduced for the fund's liabilities and divided by the number of shares outstanding, the net asset value of the fund per share (NAV) is obtained. This value is also called bid or sell price and is the basic price at which it is possible to sell the share or units of the open-end investment fund.

According to the data of the Securities and Exchange Commission, shown in Table 2, the total net value of the assets of the investment funds on 31.12.2020 was 145 million euros and was 3.72% higher than the assets last year, ie 148.31% in terms of assets at the end of 2016.

In terms of the structure of total assets, the highest value of net assets shows KB Publikum - Parichen, with almost 36% of total net value. And in terms of net asset value per share, the highest is the value of Generali Brik (<https://www.sec.gov.mk/AnalitikaFondovi>), shown in Table 4 - Net asset value of open-end investment funds.

⁴ The category of other institutions, presented collectively in the table, includes all other institutions with a share of less than 0.5%, such as: saving houses, leasing companies, financial companies, brokerage companies, etc.

Table 4 - Net asset value of open-end investment funds

Investment Fund	Net asset value in EUR on 31.12.2020	Participation in total assets %	Net asset value per share in EUR

5.2 Structure of investments of open-end investment funds

Open-end investment funds in Macedonia differ significantly in terms of investment structure, depending on how much risk is assumed by the fund, ie how much potential return it expects or seeks to achieve. According to the investment structure, the funds invest in the domestic and foreign markets in short-term securities and deposits, investment funds, shares and various types of bonds. The structure of investments, apart from the type of property in which is invested and the geographical exposure, can also be analysed according to the sectoral and currency exposure.

According to the Quarterly Report of the Securities and Exchange Commission in 2020, in terms of types of investments (equity, bond and cash), cash funds have a dominant position with a share ranging from 59 to 67%. The share of the equity funds ranges from 28 - 32%, and the bond funds participate with about 5% in the total net value.

According to the activity in which the open-end investment funds invest, most of them are financial services - up to 23% of the total funds at the end of the year, up to 18% are in healthcare companies, non-cyclical consumption up to 13% and information technology up to 11% of the funds .

According to the geographical exposure of the investment funds, at the end of 2020, majority of the funds, ie more than 70% of the fund's total assets, were invested in the Republic of North Macedonia. About 12% of the total funds raised were invested in the member states of the European Union, while the rest of the funds were invested in the United States, Russia and other countries. This geographical structure of investments is primarily due to the policy of investing funds in deposits, which according to the Law on Investment Funds, can only be deposits in Macedonian banks.

In regards to the currency structure of investments, most of the funds are invested in denars - 58%, in euros are 30%, in dollars 9%, the rest are in other currencies, with insignificant share (Quarterly Report, 2021).

5.3 Return on investment in open-end investment funds

The basic and most reliable measure of the investment fund's success is the growth of the share's value ie the return of the investment fund.

Mutual funds can gain profit in three ways: on the basis of dividends and interest earned from securities in the portfolio, if the sale of a security is a profit or capital gain that usually belongs to investors, and if the value of the securities from the fund's portfolio grow, and with that to increase the value of the NAV.

Yield actually represents the difference between the purchase and sale value of shares. That is, the yield is a percentage increase in the value of the share at the end compared to the beginning of the observed period. It is usually expressed as a percentage of the purchase price of the fund's share.

The total return, in addition to the profits on all the above bases (realised), also includes the unrealised capital gains which are expressed through the growth of NAV.

The return of the individual investment funds at the end of 2020, according to the data on open-end investment fund management companies, is shown in Table 5 - Open-end investment fund's yield.

Table 5 – Open-end investment fund's yield

Open-end Investment Fund	1Y	2Y	YTD
Grave Global	0,46	/	0,76
VFP 100% Bond	0,17	0,42	0,31
VFP Dividenda	/	/	/
VFP Kesh Depozit	0,09	0,10	0,15
VFP Premium Invest	-0,03	0,94	0,42
KB Publikum - Balansiran	1,37	0,57	0,72
KB Publikum - Parichen	0,12	0,13	0,18
KB Publikum - MBI 10	2,33	1,18	1,45

Ilirika Kesh Fond	0,10	0,12	0,19
Inovo Status Akcii	0,21	0,03	0,10

Source: Securities and Exchange Commission (SEC)

The companies managing the open-end investment funds have a legal obligation to publish quarterly reports of the average rate of return of the fund they manage (Sl.Vesnik na RM, 2010). The rate is calculated for the following periods: one week, one month, six months, one year, two years and five years or from the date of establishment of the fund, until the day of reporting.

Table 5 presents the basic data on the rate of return for one year (1Y), two years (2Y) and from the date of establishment (YTD). For a period of one year, the highest yield rate was achieved by Generali Brik, and KB Publikum - MBI 10, the highest rate for the period longer than one year. This is due to the quality of the instruments in which the managing companies have invested the assets of these funds.

6. PERSPECTIVES FOR DEVELOPMENT OF OPEN-END INVESTMENT FUNDS IN THE REPUBLIC OF NORTH MACEDONIA

The development of investment funds in each country is directly related to the development of the capital market. In order for the capital market in a country to function efficiently, it is necessary to have good regulation and supervision, as well as developed stock exchange and financial operations. It is also a condition for successful transformation into a highly developed market economy with a developed capital market.

Although they exhibit dynamic growth, investment funds in North Macedonia are still at the initial development stage, compared to their market share in developed countries. To encourage their development, the legislation since its initial adoption, to date, has been amended several times and harmonised with the principles of the International Organisation of Securities Commissions and the legislation of the European Union.

A step forward in the development of investment funds in North Macedonia is expected with the amendments to the Law on Investment Funds, proposed at the beginning of 2021. It is believed that these changes will open opportunities for the formation of new types of investment funds, will improve transparency and efficient management of investors' funds.

The development of investment funds also depends on the development of the Macedonian Stock Exchange and the offer of attractive financial instruments that will enable optimisation of the investment fund portfolio and risk diversification.

The degree to which potential investors in North Macedonia are informed, is also a key factor for the development of investment funds. It is considered that its citizens and the corporate sector lack sufficient information about opportunities offered by investment funds. The banking sector, having gained people's trust through traditional saving habits, still plays a dominant role in the capital market.

It is important to note that in North Macedonia, despite underdeveloped investment activities, a great deal has been done in recent years and significant steps have been taken to alleviate the administrative barriers that exist to enter the capital market. There is a significant improvement of the entire legislation, high level digitalisation in all sectors of the economy, good regulation of the financial sector, introduction of fiscal incentives and of course regular updates from the government and other organisational bodies. This should have a positive effect in strengthening the capital market in North Macedonia and greater affirmation of investment funds.

7. CONCLUSION

Investment funds are relatively young participants in the Macedonian capital market, but they are of vital importance to our economy because they raise the financial sector to a higher level and encourage different ways of saving. There are several reasons why investors would invest in mutual funds: the possibility of portfolio diversification thus minimising investment risk; professional securities management; lower costs for services and the relatively high level of investment security provided by the regulation and supervision of this segment of the capital market.

Currently in North Macedonia there are only open-end investment funds, but with constant improvement to legislation and alignment with EU directives, the development of other types of investment funds is expected including an improvement of the overall infrastructure of the capital market.

Open-end investment funds are still a small segment of the financial system of North Macedonia with a share of 1.3%, although the analysis indicates a continuous growth trend in recent years, which is expected to continue in the future. In support of this conclusion, is the significant increase in the net asset value of open-end investment funds by 147.31% at the end of 2020, compared to the value in 2016. These are important indicators of the rapid market development in RNM, especially given the fact that it is a small and underdeveloped capital market.

The Securities and Exchange Commission's data for the period ending 2020 indicates that in North Macedonia, the largest investments are made in cash funds, and most of the investment funds' assets are bank deposits, of which more than 70% are in the Republic North Macedonia. However, the most important measure of an investment fund's success is the return on investment. The latest official data indicates that in North Macedonia, the return on investment is at an all-time high.

Despite the fact that investment funds are still at their initial stage of development, regulation surrounding them is constantly improving; the supply of securities is being enriched and the level of awareness among potential investors is on the rise. This should ensure further growth and development of investment funds and the capital market while being a step closer to European and global markets.
